## Keep Your Card in This Pocket

---

Books will be issued only on presentation of proper library cards.

Unless labeled otherwise, books may be retained for two weeks. Borrowers finding books marked, defaced or mutilated are expected to report same at library desk; otherwise the last borrower will be held responsible for all imperfections discovered.

The card holder is responsible for all books drawn on this card.

Penalty for over-due books 2c a day plus cost of notices.

Lost cards and change of residence must be reported promptly.

## PREFACE

The assembly of the table of values for the heats of formation in the section on Thermochemistry in the International Critical Tables was the first attempt ever made to collate all the published data involving heats of reaction and to prepare therefrom a self-consistent table of "best" values for the heats of formation of the chemical substances. The present book is a complete revision and extension of that original work, which was sponsored by the late Edward W. Washburn as Editor-in-Chief of the International Critical Tables and carried out by one of the present authors (F. R. B.)

The assembly of a self-consistent table of values for the heats of formation of all the chemical substances requires (1) that all the original experimental data be recalculated with the use of appropriate auxiliary data, (2) that the value selected for the heat of formation of a given substance be as accurate as it is possible to obtain from the known data, and (3) that the selected "best" value be as consistent as possible with all the other values in the table and with all the known thermochemical data on reactions involving that substance.

There are four main sections to the present book: (1), the introduction or explanatory part; (2), the table of heats of formation, which is the fruit of the work; (3), the text, in which the original published data are cited and discussed; and (4), the list of references to the literature, which includes references to all the published data bearing on thermochemistry.

The introduction gives all the necessary information concerning the units, symbols, abbreviations, method of utilizing the table, etc.

The table of values contains a list of all the chemical substances (except carbon compounds containing more than 2 carbon atoms), for which there are thermochemical data, together with values for the heats of formation (or heat of transition, fusion, or vaporization) of each substance. It was deemed expedient not to include in the present table values for the heats of formation of carbon compounds containing more than two carbon atoms. It should be possible to obtain from this table, by simple addition and subtraction, the heat of any process involving any of the substances given, with an accuracy as great as is actually known. There are listed in the table 5840 values of heats of formation, and, in addition, 350 values of heats of transition, fusion, vaporization, or reaction, for substances for which no values are given for the heat of formation.

In the text, each paragraph or group of paragraphs is labeled with the formula of a chemical substance (or substances), and under that heading are cited all the published thermochemical data on reactions which can

be utilized to compute the heat of formation of the given substance (or substances).

In the list of references are given the citations to the literature for all the published works bearing on thermochemistry which are discussed or mentioned in the text. This list of 3730 references includes all the publications covered by Chemical Abstracts up to January 1, 1931, and nearly all of the important and significant contributions which have been published in the period from January 1, 1931, to January 1, 1934.

The symbols given in this book for the various heats of reaction, fusion, vaporization, sublimation, transition, dissociation, and formation are merely abbreviations used for convenience in the present work, and are not proposed to be used in lieu of, or in connection with, the regularly accepted symbols of chemical thermodynamics.

The standard temperature selected for the values given in this book is 18° Centigrade, following the procedure of the thermochemistry section (Bichowsky<sup>1</sup>) of the International Critical Tables. The authors have been reluctant not to use the almost universally accepted standard temperature of 25° Centigrade for thermodynamic calculations; but the selection of 18° as the standard temperature is practically necessary in this case because all of the monumental work of Julius Thomsen and of Marcellin Berthelot was done at or near 18° and there are not now available sufficient heat capacity data with which to make accurate conversion to 25° (this is especially important for reactions involving substances in aqueous solution where the temperature coefficient is usually very large). In later years, as the data on heat capacities become available, or as the heats of many of the reactions, which have until the present time been measured only by Thomsen or Berthelot or both, are redetermined, it will be quite feasible to use 25° as the standard temperature.

Where it is expedient and necessary, each unusual method of calculation used in the text is explained. The ordinary and simple methods of calculating thermochemical values are assumed to be known to the reader, and the advanced methods which are used but not described may be found explained in one of the many current books on advanced physical chemistry or thermodynamics.

The authors will greatly appreciate the cooperation of readers in making known the errors which they find in this book. Grateful acknowledgment is made to Anne Landgraff Rossini for aid in compilation and checking the copy and proofs.

In compiling the present book, the authors hope that their work will materially aid all those who have need of the data of thermochemistry, and will feel amply rewarded if their efforts help to stimulate renewed activity in the much-neglected but vastly important field of thermochemical research.

## INTRODUCTION

**Scale of temperature.** With a few exceptions all temperatures recorded in this book are on the Centigrade scale, and, for convenience, temperatures on the Centigrade scale are indicated by a numeral and degree mark without the letter "C," as 18°.

**Unit of energy.** The fundamental unit of energy in modern thermochemical measurements is the electrical joule, which is derived from standards of resistance and electromotive force maintained at the various national standardizing laboratories.

In the section on Thermochemistry in the International Critical Tables (see Bichowsky<sup>1</sup>), the values were recorded in joules, in the hope that thermochemists might come to use this fundamental unit in their calculations and writings. But the attempt to break away from the calorie as a unit in thermochemical and thermodynamical calculations proved to be unpopular and apparently hopeless of accomplishment. In order to satisfy the popular demand for the calorie as a unit in calculations and tabulations, and at the same time depart as little as possible from the fundamental unit of energy, the joule, in terms of which all accurate thermochemical measurements are actually made, we have used in this book a **defined calorie**, that is, one which has no actual relation whatever, except incidentally and historically, to the heat capacity of water.

In our calculations, the modern experimental data, which have been fundamentally obtained in terms of the international joule, have been converted to a **defined calorie** by means of the following relations (see Rossini<sup>2, 13</sup>): 1 calorie=4.1850 absolute joules; 1 international joule =1.0004 absolute joules; 1 calorie=4.1833 international joules. The values from the older experimental data have been converted to this unit by means of the appropriate factors.

For conversion of values expressed in terms of the **defined calorie** to other desired units, the following factors can be used:

To convert the value in kilocalories to its equivalent in	Multiply the value in kilocalories by
International kilojoules .....	4.1833
Absolute kilojoules .....	4.1850
Absolute volt-electrons .....	0.04337

For converting data on the electromotive force of cells, the value of the Faraday constant has been taken as equal to 23.066 kilocalories per international volt-equivalent.

*All the energy values, unlabeled with regard to units, that are given in the text and table are in terms of the kilocalorie defined in the foregoing manner.*

**Unit amount of substance.** The unit amount of each chemical substance is taken to be that mass represented by its gram formula weight. In recomputing the data of those investigators who reported their results in terms of "weights in air," the authors have reduced to *vacuo* all pertinent weights, when such reduction was significant. *All values of energy given in this book are understood to be for one mole of the given substance (or reaction).* The atomic weights given in the table are those from the 1934 Report of the Committee on Atomic Weights of the International Union of Chemistry (see Baxter, Curie, Hönigschmid, Le Beau, and Meyer<sup>1</sup>). Where the necessary changes were at all significant, the thermochemical values given in the text and table have been changed to conform to the foregoing table of atomic weights.

However, it should be pointed out that great caution must be exercised in attempting any such conversion because of the many different methods which have been used to determine the amount of a given calorimetric reaction. For example, to determine the amount of the reaction,  $\text{Na(c)} + \text{H}_2\text{O(lq.)} = \text{NaOH(aq.)} + \frac{1}{2} \text{H}_2(\text{g})$ , one can (1) determine the mass of Na used, (2) determine the mass of  $\text{H}_2$  produced, or (3) determine the amount of NaOH by titration with (for example) an aqueous solution of HCl which has been standardized with  $\text{AgNO}_3$  which in turn has been prepared from a weighed amount of pure Ag. The calculation of the number of moles of reaction taking place will depend in case (1) on the atomic weight of Na, in case (2) on that of H, and in case (3) on that of Ag. Another example is that the value obtained by Rossini<sup>4,8</sup> for the heat of combustion of 1 mole of  $\text{CH}_4$  is independent of the atomic weight of carbon, because the amount of calorimetric reaction was determined from the mass of  $\text{H}_2\text{O}$  formed in the combustion.

**Standard states.** The standard or reference state of each of the elemental substances is taken to be that physical state (or one of them, if there are two or more) in which the element naturally exists at a pressure, or a fugacity, of one atmosphere and at a temperature of 18°. The isotopic composition of each element in its standard state is understood to be the naturally existing one. For the element carbon, we have selected its form as diamond, C (c, diamond), as the standard state because no other form of solid carbon is at present a reproducible and invariable one.

**Aqueous Ions.** In order to facilitate the computation of the heats of formation of aqueous strong electrolytes, we have taken as an arbitrary reference point for aqueous ions the heat of formation of aqueous hydrogen ion,  $\text{H}^+(\text{aq.})$ , to be zero. Therefore, the values given in the table for the heats of formation of individual aqueous ions are not the actual

heats evolved in the reaction of forming those individual ions from their elements in the standard states, but the sum of the values for a number of ions whose charges sum to zero does represent the actual heat of formation of the sum of those aqueous ions.

**Conventions as to temperature, pressure, and concentration.** *Every heat of formation or heat of reaction value given in the table or in the text is understood to be, unless otherwise specified, the value for the heat evolved when the reaction takes place at a constant pressure, or a fugacity, of one atmosphere and at a temperature of 18°. This means that those data obtained at some other temperature have been converted, when the conversion is at all significant, to a temperature of 18°; and that those data obtained at other than constant pressure have been converted to constant pressure. For substances in aqueous (or other) solution, the concentration, when known, is indicated. When the concentration is not indicated, it is understood to be for a "dilute" solution.*

**Physical state and its description.** The physical state of each substance is indicated, in the text and in column 2 of the table, as gaseous, liquid, crystal, glass, colloidal, or in aqueous or other solution. (See the list of abbreviations on page 14.) All states are for a pressure, or a fugacity, of one atmosphere and a temperature of 18°, unless otherwise indicated.

Numerals, in column 2 of the table or in the text in parentheses following the formula of the substance, indicate that one mole of the substance is dissolved in that number of moles of  $\text{H}_2\text{O}$ . When the concentration is not known, there is written, instead of the numeral, the abbreviation "aq." which indicates a large number of moles of  $\text{H}_2\text{O}$ , i. e., the solution is "dilute."

When the substance is dissolved in a solvent other than water, the formula (or name) of the solvent is given, and, if known, the number of moles of it per mole of solute. When the concentration is not given, the solution is understood to be "dilute."

In column 3 of the table are recorded items which serve to identify the substance for which the value of the heat of formation is given. For crystalline substances having stable transition points, the various solid crystalline forms are indicated as I, II, III, IV, etc., beginning with the form stable at the normal melting point. For atoms, ions, and certain molecules, in the gaseous state, the electron configuration and term symbols are given (see Mulliken,<sup>6</sup> Jevons,<sup>1</sup> and Bacher and Goudsmit<sup>1</sup>).

**Heat of formation.** The heat of formation of a substance, as MX (crystal), is taken to mean the heat evolved in the reaction of forming one mole (gram formula weight) of that substance from its elements in their standard states (as, for example:  $\text{M (liq.)} + \frac{1}{2} \text{X}_2 \text{ (g)} = \text{MX (c)}$ ) at a constant pressure (or a fugacity) of one atmosphere and, unless otherwise

specified, at a temperature of 18°. The values for the heats of formation of the substances are given in the table in the column headed  $Q_f$ . In the text these values are also labeled  $Q_f$ . Translated into the nomenclature of Lewis and Randall,<sup>5</sup>  $Q_f = -\Delta H^\circ$  (formation), the decrement in heat content accompanying the reaction of forming the given substance from its elements in their standard states.

In this book, the values for the heats of formation of substances in aqueous or other solution represent values of the apparent molal heat content, not the partial molal heat content (see Lewis and Randall<sup>5</sup> and Rossini<sup>6</sup>). That is to say, for example, the value of  $Q_f$  for NaCl (200) means actually the heat of the reaction,  $\text{Na (c)} + \frac{1}{2} \text{Cl}_2 \text{ (g)} + 200 \text{ H}_2\text{O (liq.)} = (\text{NaCl} \cdot 200 \text{ H}_2\text{O}) \text{ (liq.)}$ , though it is written here for convenience as  $\text{Na (c)} + \frac{1}{2} \text{Cl}_2 \text{ (g)} = \text{NaCl (200)}$ . And, similarly, the difference between the values of  $Q_f$  for NaCl (200) and NaCl (400) gives the heat of the reaction,  $(\text{NaCl} \cdot 200 \text{ H}_2\text{O}) \text{ (liq.)} + 200 \text{ H}_2\text{O (liq.)} = (\text{NaCl} \cdot 400 \text{ H}_2\text{O}) \text{ (liq.)}$ , which equation is written, by the convention of this book, as  $\text{NaCl (200)} = \text{NaCl (400)}$ .

**Computation of the heat of any process.** To compute the heat of any process involving the disappearance of a substance or substances in the states given in the table and the appearance of other or the same substances in states given in the table: Add together the heat of formation (values for  $Q_f$ ) of the products of the process in the final states and subtract therefrom the sum of the heats of formation (values for  $Q_f$ ) of the reactants in their initial states. The value so obtained represents the heat evolved when the given process takes place at a constant pressure (or a fugacity) of one atmosphere and at a temperature of 18°. The following are examples:

#### Heat of reaction

$$\begin{aligned} Q &= -\Delta H = \{ Q_f [\text{BaSO}_4 \text{ (c)}] + 2 Q_f [\text{HCl (400)}] \} - \\ &\quad \{ Q_f [\text{BaCl}_2 \text{ (400)}] + Q_f [\text{H}_2\text{SO}_4 \text{ (400)}] \}. \\ &= \{ 349.4 + 2 (39.525) \} - \{ 207.350 + 211.84 \} = 9.260. \end{aligned}$$

#### Heat of solution

$$Q = -\Delta H = Q_f [\text{KCl (400)}] - Q_f [\text{KCl (c)}] = 99.899 - 104.361 = -4.462.$$

#### Heat of dilution

$$Q = -\Delta H = Q_f [\text{HCl (3200)}] - Q_f [\text{HCl (50)}] = 39.629 - 39.257 = 0.372.$$

Heat of ionization in aqueous solution

$$Q = -\Delta H = \{Q_f [\text{H}^+ (\infty)] + Q_f [\text{C}_2\text{H}_3\text{O}_2^- (\infty)]\} - Q_f [\text{HC}_2\text{H}_3\text{O}_2 (\infty)] \\ = \{0.000 + 117.946\} - 118.070 = -0.124.$$

Heat of ionization in the gaseous phase

$$Q = -\Delta H = Q_f [\text{H}^+ (\text{g})] - Q_f [\text{H} (\text{g})] = -365.58 - (-51.90) = -313.68.$$

Heat of dissociation

$$Q = -\Delta H = 2Q_f [\text{I} (\text{g})] - Q_f [\text{I}_2 (\text{g})] = 2(-25.59) - (-14.91) = -36.27.$$

Heat of sublimation

$$Q = -\Delta H = Q_f [\text{KCl} (\text{g})] - Q_f [\text{KCl} (\text{c})] = 52.4 - 104.361 = -52.0.$$

**Accuracy of the values.** All the values recorded in the table have been recomputed from the original experimental data, using consistent values for all subsidiary quantities. Heats of reaction, of dilution, of solution, of neutralization, of transition, etc., may be computed by difference with an accuracy as high as is known. The number of significant figures in any one value in the table does not indicate the absolute accuracy of that value, which will be less than that of the least accurate determination in the total chain of reactions used to calculate the value. In most cases, sufficient information to deduce the accuracy of any value is given in the text.

**References to the literature.** References to the original data are given in the text, as Washburn.<sup>2</sup> The exact citation can then be found in the list of references, which are given in alphabetical (and numerical) order, as Washburn,<sup>2</sup> *Bur. Standards J. Research* 10, 525 (1933), where the numerals indicate, respectively, the volume, page, and year. The abbreviations used for the titles of the periodicals are those adopted as standard by the International Union of Chemistry (See, for example, Chemical Abstracts' "List of Periodicals Abstracted"). When the citation is that of a book, it is written as Washburn, "Introduction to the Principles of Physical Chemistry," McGraw-Hill Book Co., New York (1921), where the title is in quotation marks, and then in order follow the name of the publisher, the place of publication, and, in parentheses, the year of publication. If the book citation includes volume and page numbers, these follow immediately after the title.

**Superscripts and subscripts.** A numeral superscript, as  $E^{25}$ , indicates the temperature in degrees Centigrade. For convenience, the super-

script "<sup>z</sup>" (as, for example,  $D^z$ ) is used in place of the superscript "<sup>-273</sup>" to indicate the absolute zero of temperature.

The asterisk superscript "\*" applied to the formula of a given chemical substance indicates that the given ion, atom, or molecule is in an excited state, that is, in an electronic state having an energy content greater than that of the ground or normal state.

A numeral subscript, as  $A_{100}$ , indicates the number of moles of  $H_2O$  per mole of solute in the solution. A word subscript, as  $A_{CH_3OH}$ , with or without a numeral subscript giving the number of moles of solvent, indicates the solvent, if other than  $H_2O$ . These subscripts and superscripts may be attached either to the symbol representing the kind of reaction or to the number representing the value of the heat of the reaction.

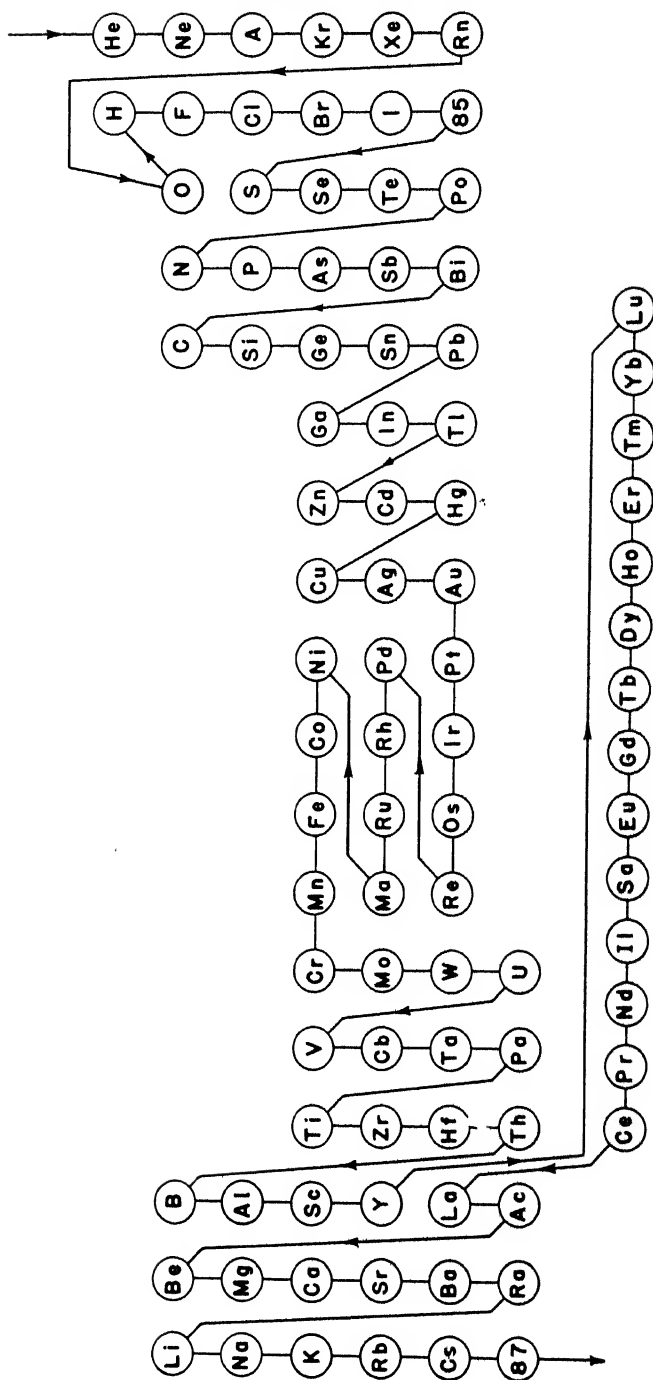

**Abbreviations.** The following abbreviations are used:

amorp.	Amorphous, or ill defined solid state.
aq.	In a dilute aqueous solution.
c	Macrocrystalline.
<i>C</i>	Heat of combustion. The heat evolved in the combustion of the given substance at constant pressure in oxygen.
<i>D</i>	Heat of dissociation. When applied to gaseous diatomic molecules, <i>D</i> represents the heat evolved in the reaction, $Z_2(g) = 2Z(g)$ , at constant pressure (or fugacity). When applied to hydrates, ammines, etc., <i>D</i> represents the heat evolved, per mole of gaseous $H_2O$ (or of $NH_3$ , etc.) in the reaction, $Z \cdot n H_2O(c) = Z \cdot (n-a) H_2O(c) + a H_2O(g)$ , at constant pressure.
<i>E</i>	Excitation energy. The energy evolved in the process of elevating a gaseous substance from a given electronic energy state to a higher electronic energy state.
<i>F</i>	Heat of fusion. The heat evolved in the reaction, $Z(c) = Z(liq.)$ , at constant pressure.
g	Gas.
gls.	A glass or solid supercooled liquid.
<i>I</i>	Energy of ionization of a gaseous substance. The energy evolved in the process of removing an electron from a gaseous substance.
(ideal)	In the condition indicated by the formula, e. g., for $N_2O_4(g)$ , the word "(ideal)" indicates that the heat of formation is for a gas composed only of $N_2O_4$ molecules.
liq.	Liquid.

<i>N</i>	Heat of neutralization. The heat evolved in the reaction, $\text{HX (aq.)} + \text{MOH (aq.)} = \text{MX (aq.)} + \text{H}_2\text{O (liq.)}$ , at constant pressure.
ppt.	Precipitated.
<i>Q</i>	Heat of reaction. The heat evolved when the given reaction takes place at constant pressure. In the nomenclature of Lewis and Randall, <sup>5</sup> $Q = -\Delta H$ .
<i>Qf</i>	Heat of formation. The heat evolved in the reaction of forming the given substance from its elements in their standard states, at constant pressure. In the nomenclature of Lewis and Randall, <sup>5</sup> $Qf = -\Delta H^\circ$ (formation).
<i>S</i>	Heat of solution (in water unless specified otherwise by a word subscript). The heat evolved in the reaction, $Z \text{ (c, liq., or g)} = Z \text{ (aq.)}$ (or other solvent), at constant pressure.
satd.	In a saturated solution in water.
$T^{110} \rightarrow \text{II}$	Heat of transition. For example, when given in connection with the substance $Z \text{ (c, I)}$ , $T^{110} \rightarrow \text{II}$ is the heat evolved in the reaction, $Z \text{ (c, I)} = Z \text{ (c, II)}$ , at constant pressure and at $110^\circ$ .
<i>X</i>	F, Cl, Br, or I.
<i>V</i>	Heat of vaporization. The heat evolved in the reaction, $Z \text{ (liq.)} = Z \text{ (g)}$ , at constant pressure.
<i>Vs</i>	Heat of sublimation. The heat evolved in the reaction, $Z \text{ (c)} = Z \text{ (g)}$ , at constant pressure.
$\theta$	Electron gas.

**Order of arrangement of the chemical substances in the table.** The substances listed in the thermochemical table are arranged in a manner analogous to that used in the International Critical Tables. The principle of this method is as follows: The chemical elements are arranged in a certain prescribed order, as *a, b, c, d, e, f, g, h*, etc. Then all the chemical substances will be arranged in the table in the following order: *a; b, ba; c, ca, cb, cba; d, da, db, dba, dc, dca, dcba; etc.* In this book, the prescribed order of the elements is that given in the diagram on page 16. With several exceptions, the arrangement follows the periodic table quite closely, starting with the rare elements, going through the negative elements, and ending with the most positive substance, element 87.

*Order of arrangement of the chemical elements.*

## Element 87

Atomic number 87

Standard state M (c)

Atomic weight (223?)

## HELIUM

**He (g).** The values for the energy states of gaseous monatomic helium are from Hansen and Thorsen,<sup>1</sup> Hylleraas,<sup>1</sup> and Bacher and Goudsmit.<sup>1</sup>

**He (liq.).** Vapor pressure data were reported by Dana and Onnes,<sup>1, 2</sup> Keesom, Weber, and Ngaard,<sup>1</sup> Keesom, Weber, and Schmidt,<sup>1</sup> Onnes,<sup>1, 2</sup> Onnes and Weber,<sup>1, 3</sup> and Spangenberg.<sup>1</sup> We have utilized the data of Dana and Onnes.<sup>1, 2</sup>

**He (c.)** Simon and Steckel<sup>1</sup> reported values for the heat of fusion of helium at pressures from 1120 to 1860 kg per cm.<sup>2</sup> He (c) is not stable at 1 atmosphere. See also van Laar.<sup>11</sup>

**He<sub>2</sub> (g).** The values for the energy states and the energy of dissociation of gaseous diatomic helium are from Weizel,<sup>1, 2, 3, 4, 5</sup> Weizel and Pestel,<sup>1</sup> Weizel and Fichtbauer,<sup>1</sup> Imanishi,<sup>1, 2</sup> Curtis,<sup>1</sup> Curtis and Harvey,<sup>1</sup> and Mulliken.<sup>6</sup> See also Jevons.<sup>1</sup>

## NEON

**Ne (g).** The values for the energy states of gaseous monatomic neon are from Paschen,<sup>5</sup> Hansen and Thorsen,<sup>1</sup> de Bruin,<sup>3</sup> Russell, Compton, and Boyce,<sup>1</sup> Compton, Boyce, and Nickerson,<sup>1</sup> Bleakney,<sup>1</sup> and Bacher and Goudsmit.<sup>1</sup>

**Ne (liq.).** Vapor pressure data for liquid neon were reported by Cath and Onnes,<sup>1</sup> Crommelin,<sup>5</sup> Onnes and Crommelin,<sup>2</sup> Crommelin and Gibson,<sup>1</sup> Clusius,<sup>1</sup> Verschaffelt,<sup>2</sup> and Mathias, Crommelin, and Onnes.<sup>3</sup>

**Ne (c).** Verschaffelt<sup>2</sup> measured the vapor pressure of solid neon.

## ARGON

**A (g).** The values for the energy states of gaseous monatomic argon are from Meissner,<sup>1</sup> Saunders,<sup>3</sup> Compton, Boyce, and Russell,<sup>1</sup> Compton, Boyce, and Nickerson,<sup>1</sup> Bleakney,<sup>1</sup> and Bacher and Goudsmit.<sup>1</sup>

**A (liq.).** Eucken<sup>2, 3</sup> measured directly the heat of vaporization, obtaining  $V = -1.501$  at  $-185.6^\circ$ . This value is in agreement with the value  $-1.54$  calculated from the vapor pressure data of Born,<sup>1</sup> Crommelin,<sup>1, 2, 3</sup> and Mathias, Crommelin, and Onnes.<sup>3, 4</sup>

**A (c).** Eucken and Hauch<sup>1</sup> measured the heat of fusion. See also Eucken.<sup>2, 3</sup>

**A · 5 H<sub>2</sub>O (c).** According to Villard<sup>8</sup> and de Forcrand,<sup>68</sup> argon forms a well-defined pentahydrate. The latter's data on the dissociation pressure from 0 to  $8^\circ$  yield a value for the heat of the reaction of dissociating the solid hydrate into gaseous argon and liquid water.

## KRYPTON

**Kr (g).** The values for the energy states of gaseous monatomic krypton are from Meggers, de Bruin, and Humphreys,<sup>1</sup> Bleakney,<sup>1</sup> Deb and Dutt,<sup>1</sup> Dejardin,<sup>1</sup> and Bacher and Goudsmit.<sup>1</sup>

**Kr (liq.).** The vapor pressure data of Peters and Weil<sup>1</sup> yield  $V = -2.31$  at the boiling point,  $-151.0^\circ$ . Other vapor pressure data were reported by Ramsey,<sup>1, 3</sup> Ramsey and Travers,<sup>1</sup> and Patterson, Cripps, and Whytlaw-Gray.<sup>1</sup>

**Kr (c).** We have estimated the heat of fusion of krypton.

**Kr · 5 H<sub>2</sub>O (c).** According to Villard<sup>8</sup> and de Forcrand<sup>68</sup> there is a well-defined pentahydrate of krypton. The latter computed the heat of dissociation into gaseous krypton and liquid water from his data on the dissociation pressure at temperatures from 0 to  $12^\circ$ .

### XENON

**Xe (g).** The values for the energy states of gaseous monatomic xenon are from Meggers, de Bruin, and Humphreys,<sup>1</sup> Deb and Dutt,<sup>1</sup> and Bacher and Goudsmit.<sup>1</sup>

**Xe (liq.).** The vapor pressure data of Peters and Weil<sup>1</sup> yield  $V = -3.27$  at the boiling point,  $-108.6^\circ$ . Other vapor pressure data were reported by Ramsey and Travers<sup>1</sup> and Patterson, Cripps, and Whytlaw-Gray.<sup>1</sup>

**Xe (c).** We have estimated the heat of fusion.

**Xe · 6 H<sub>2</sub>O (c).** According to de Forcrand,<sup>70</sup> there is a well defined hexahydrate. His data on the dissociation pressure at temperatures from  $1.5$  to  $23.5^\circ$  yield a value for the heat of dissociation of the solid hydrate into gaseous xenon and liquid water.

### RADON

**Rn (g).** The values for the energy states of gaseous monatomic radon are from Rasmussen<sup>1</sup> and Bacher and Goudsmit.<sup>1</sup>

**Rn (liq.).** We have estimated the heat of vaporization.

**Rn (c).** We have estimated the heat of fusion.

### OXYGEN

**O<sub>2</sub> (g).** The standard state is taken to be the naturally existing mixture of oxygen molecules containing the atoms, O<sup>16</sup>, O<sup>17</sup>, and O<sup>18</sup>. The values for the energy states of gaseous diatomic oxygen are from Mulliken<sup>6</sup> and Jevons.<sup>1</sup>

**O<sub>2</sub> (liq.), O<sub>2</sub> (c).** We have selected Giaque and Johnston's<sup>1</sup> accurate calorimetric values for the heats of transition, fusion, and vaporization of oxygen. These and the earlier calorimetric data of Eucken,<sup>2, 3</sup> Alt,<sup>1</sup> Barschall,<sup>1</sup> and Keesom,<sup>1</sup> as well as the vapor pressure data of Cath,<sup>1</sup> Holst,<sup>4</sup> Onnes and Braak,<sup>1</sup> Onnes and Crommelin,<sup>1</sup> and von Siemens,<sup>1</sup> are in substantial agreement.

**O<sub>2</sub> (aq.).** From the data of Winkler<sup>1, 2, 6, 9, 10</sup> and Cassuto<sup>1</sup> on the solubility of oxygen in water at various temperatures we have calculated  $S = 3.85$ . Washburn and Strachan<sup>1</sup> computed  $S = 3.0$ .

**O (g).** The value for the energy of dissociation of the normal oxygen molecule into normal oxygen atoms is  $5.09 \pm 0.03$  volt-electrons. This

value is from Herzberg,<sup>2</sup> Wigner and Witmer,<sup>1</sup> Birge,<sup>2, 3, 5</sup> and Birge and Sponer.<sup>1</sup> See also Henri,<sup>1</sup> Mecke,<sup>5</sup> Kondratjew,<sup>1</sup> Baxter,<sup>1</sup> Jenckel,<sup>1</sup> Eucken,<sup>1</sup> and Warburg.<sup>1</sup> Copeland<sup>1</sup> and Rodebush and Troxel<sup>1</sup> made direct calorimetric measurements of the energy of recombination of oxygen atoms on a palladium surface, but their values, though identical, are about 12 per cent higher than the accepted value and may indicate a systematic error. See also Reisenfeld and Schumacher,<sup>1</sup> Reisenfeld and Wassmuth,<sup>1</sup> and Kassel.<sup>1, 2</sup>

The values for the energy states of gaseous monatomic oxygen are from Frerichs,<sup>1, 2</sup> Paschen,<sup>8</sup> Bowen,<sup>1, 2, 8</sup> Kaplan,<sup>1</sup> Sommer,<sup>1</sup> McLennan and Crawford,<sup>1</sup> Hopfield,<sup>1</sup> Russell,<sup>5</sup> Fowler,<sup>1</sup> Fowler and Hartree,<sup>1</sup> Laporte and Young,<sup>2</sup> Edlen and Ericson,<sup>1</sup> and Bacher and Goudsmit.<sup>1</sup>

$O^-$  (g). The electron affinity of the oxygen atom may be evaluated by extrapolation of the square root of the ionization potentials of  $F^-$ ,  $Ne$ , and  $Na^+$ , but adequate data for  $F^-$  are not available. The only other method which presents itself is by way of the reaction  $MO(c) = M^{++}(g) + O^-(g)$ . Using the values for the lattice energies as given by Sherman,<sup>2</sup> and taking the values for the heats of formation for  $MO(c)$  and  $M^{++}(g)$  from our tables, we have calculated the following values for the heat of formation of  $O^-(g)$  from the data on the various metallic oxides:  $-224.9$ ,  $MgO$ ;  $-226.8$ ,  $CaO$ ;  $-224.6$ ,  $SrO$ ;  $-222.6$ ,  $BaO$ ;  $-226.2$ ,  $Li_2O$ ;  $-204$ ,  $NiO$ ;  $-231.0$ ,  $ZnO$ ;  $-187.4$ ,  $CdO$ ;  $-260$ ,  $SnO_2$ . We have selected as a mean, the value  $-225$ , which gives for the electron affinity of the oxygen atom,  $O(g) + 2\theta = O^-(g)$ ,  $Q = 166$ . Senftleben<sup>1</sup> gave  $-40$  for the electron affinity, but his calculation via  $OH^-$  is very uncertain; Lande's<sup>1</sup> data lead to  $265$ , which is apparently in error.

$O_3$  (g). Berthelot<sup>38, 134</sup> and Mulder and Van der Muelen<sup>1, 2</sup> measured the heat of the reaction between  $O_3(g)$  and  $As_2O_3(aq.)$ . Combining their data with those of Thomsen for the reaction between  $O_2(g)$  and  $As_2O_3(aq.)$ , we have computed the following values for  $Q_f$  of  $O_3(g)$ : Berthelot,  $32.5 \pm 1.5$ ; Mulder and Van der Meulen,  $33.7 \pm 2.0$ . Recent determinations of this quantity have been made by direct catalytic decomposition. Van der Meulen, using a platinum catalyst, obtained  $35.9$ ; the data of Kailan and Jahn,<sup>3</sup> and Jahn<sup>3</sup> (cf. Woods<sup>1</sup>), who passed ozone over soda lime, lead to  $34.50 \pm 0.2$ . This latter value may be accepted with considerable confidence inasmuch as Kailan and Jahn<sup>3</sup> have shown that the use of platinum as a catalyzer results in high values, probably due to oxidation of the catalyst. See also Rideal and Kunz,<sup>1</sup> and Born and Gerlach.<sup>1</sup>

$O_3$  (liq.). Spangenberg<sup>1</sup> determined the heat of vaporization of liquid ozone.

$O_3$  (aq.). The heat of solution of ozone was computed from the data of Fischer and Tropsch<sup>1</sup> and Rothmund<sup>1</sup> on the solubility of ozone in water at various temperatures.

$O_4$  (g). The existence of  $O_4$  was first postulated by Lewis<sup>3</sup> in order to explain the anomalous magnetic properties of oxygen. and his expres-

sion for the equilibrium constant gives for  $O_4(g)$ ,  $Q_f = 0.13$ . Wulf<sup>1</sup> found bands in the absorption spectra of oxygen which he assigned to the  $O_4$  molecule. If, following Kondratjew,<sup>1</sup> it is assumed that the band at  $47,500\text{ cm}^{-1}$  is associated with the reaction,  $O_4(g) (\text{normal}) = O_3(g) (\text{normal}) + O(g) (^1D)$ , then for  $O_4(g)$ ,  $Q_f = 1.2$ .

## HYDROGEN

$H_2(g)$ . The standard state of hydrogen is taken to be the naturally existing mixture of diatomic hydrogen molecules containing atoms of protium ( $H^1$ ) and deuterium ( $H^2$ ), the molecules being in equilibrium at  $18^\circ$  with respect to the ortho and para rotational states. See Dennison,<sup>1</sup> Bonhoeffer and Harteck,<sup>1</sup> Giaque,<sup>1</sup> Elbe and Simon,<sup>1</sup> Davis and Johnston,<sup>1</sup> and Johnston and Long.<sup>1</sup> For  $H^1H^1$  at  $18^\circ$ , 0.2508 of the molecules are in the para rotational states and 0.7492 in the ortho, which is very nearly the high temperature distribution of 1 to 3. The number of atoms of  $H^2$  in natural hydrogen is about 1 in 5000.

The values for the energy states of gaseous diatomic hydrogen are from Richardson<sup>3, 4, 5</sup> and Richardson and Das.<sup>1, 2</sup> See also Sandeman,<sup>1</sup> Dieke and Hopfield,<sup>1</sup> Hori,<sup>3</sup> Schaafsma and Dieke,<sup>1</sup> Richardson and Davidson,<sup>1, 2, 3, 4, 5</sup> Finkelnburg and Mecke,<sup>1, 2</sup> Mulliken,<sup>6</sup> Jevons,<sup>1</sup> and Burrau.<sup>1</sup>

$H_2(\text{liq.})$ . The calorimetric determinations of the heat of vaporization by Simon and Lange,<sup>1</sup> Keesom,<sup>1</sup> Onnes and Keesom,<sup>1</sup> Mathias, Crommelin, and Onnes,<sup>1</sup> Dewar,<sup>3</sup> and Eucken<sup>2, 3</sup> are in substantial agreement, as are values calculated from vapor pressure data by Dewar,<sup>3</sup> de Forcrand,<sup>61, 62</sup> Cederberg,<sup>1</sup> Onnes and Keesom,<sup>1</sup> Van Laar,<sup>2, 5</sup> Eucken, Karwat, and Fried,<sup>1</sup> Simon,<sup>5, 6</sup> Eucken and Fried,<sup>2</sup> Crommelin and Onnes,<sup>2</sup> Keesom,<sup>1</sup> and Onnes and Martinez.<sup>1</sup>

$H_2(c)$ . For the heat of fusion we have taken Simon and Lange's<sup>1</sup> value, which is in agreement with the earlier values of Keesom and Onnes,<sup>1</sup> but not with that of Dewar.<sup>3</sup> These data are presumably for the 1 to 3 mixture of para and ortho hydrogen.

$H_2(aq.)$ . The heat of solution is computed from the solubility-temperature data of Turnofejen<sup>1</sup> and Winkler.<sup>9</sup>

$H(g)$ . The International Critical Tables (see Bichowsky<sup>1</sup>) value for the heat of formation of monatomic hydrogen was taken from Witmer<sup>1</sup> and Dieke and Hopfield,<sup>1</sup> who gave  $D^\circ = 4.35$  volt-electrons. It has since been shown that the last line of Witmer's Lyman band is spurious, and the slightly higher value of 4.47 volt-electrons is obtained. The calorimetric data of Bichowsky and Copeland<sup>1</sup> yield  $D^\circ = 4.47 \pm 0.15$  volt-electrons. Richardson and Davidson<sup>5</sup> carefully reviewed all the data on the energy of dissociation of hydrogen and concluded that  $D^\circ = 4.46 \pm 0.04$  volt-electrons.

See Bacher and Goudsmit<sup>1</sup> for a discussion of the energy states of gaseous monatomic hydrogen.

$\text{H}^- (\text{g})$ . The electron affinity of the hydrogen atom can be determined in several ways. Extrapolation of the ionization potentials of  $\text{Be}^{++}$ ,  $\text{Li}^+$ , and  $\text{He}$  to  $\text{H}^-$  yields a value of 1.40 volt-electrons. The electron affinity can also be calculated from the lattice energy of the ionic  $\text{LiH}$  crystal. Assuming that the repulsive force varies as  $1/r^5$  for both  $\text{Li}^+$  and  $\text{H}^-$ , we have calculated for the lattice energy of  $\text{LiH}$ , the value 218.2. Hylleraas,<sup>4</sup> using a similar method, obtained 217. Hylleraas<sup>4</sup> also calculated this quantity by means of the new quantum mechanics, obtaining 218.6. This last calculation gives atomic distances in  $\text{LiH}$  in exact accord with the known density.

$\text{H}^+ (\text{aq.})$ . It is conventional to take the heat of formation of aqueous hydrogen ion as zero at infinite dilution. This value, of course, has no relation to the actual heat of formation of  $\text{H}^+ (\text{aq.})$ , which quantity could be determined if the heat of solution of  $\text{H}^+ (\text{g})$  were known. Though we have no accurate knowledge of the heat of solution of  $\text{H}^+ (\text{g})$ , its value can be estimated in several ways. The method of Latimer<sup>1</sup> requires a knowledge of the absolute potential of the hydrogen electrode and the entropy of  $\text{H}^+ (\text{aq.})$ ; while that of Born requires a knowledge of the effective diameter,  $r$ , of the hydrogen ion and the dielectric constant,  $d$ , of water, which values are used in the formula  $S = e^2/2r(1 - 1/d)$ . The values obtained by these methods are, respectively,  $S = 257$  and  $225$ ; and the absolute value of  $Q_f$  for  $\text{H}^+(\text{aq.})$  becomes  $-108$  and  $-140$ , respectively. See also Fajans<sup>3,4</sup>. However, for practical reasons, we arbitrarily take, for  $\text{H}^+ (\infty)$ ,  $Q_f = 0$ .

$\text{H}_2\text{O} (\text{liq.})$ . At the time of the compilation of the thermochemical values for the International Critical Tables by Bichowsky,<sup>1</sup> the heat of formation of water had been measured by a large number of investigators: Despretz,<sup>2</sup> Dulong,<sup>2</sup> Grassi,<sup>1</sup> Abria,<sup>2</sup> Favre and Silbermann,<sup>1</sup> Andrews,<sup>4,14</sup> Thomsen,<sup>3,15</sup> von Than,<sup>1,2,3</sup> Schuller and Wartha,<sup>1</sup> Berthelot,<sup>69</sup> Berthelot and Matignon,<sup>8</sup> Mixer,<sup>2,3</sup> and Rümelin.<sup>1</sup> The first six of these investigations must be designated as pioneering studies, while those of von Than,<sup>1,2,3</sup> Berthelot,<sup>69</sup> Berthelot and Matignon,<sup>8</sup> and Rümelin<sup>1</sup> must be withdrawn from consideration for the following reasons: Five experiments were reported by von Than,<sup>1,2,3</sup> who used an ice calorimeter and obtained an average deviation of about  $\pm 0.05$  per cent in the combustion experiments; but, unfortunately, his calibration data (energy equivalent of the calorimeter) are so few and so lacking in accuracy as to make the high precision of the combustion experiments practically valueless. Berthelot<sup>69</sup> reported the result of but one experiment. Berthelot and Matignon<sup>8</sup> performed four experiments with an average deviation of about  $\pm 0.9$  per cent. The six results given by Rümelin<sup>1</sup> have an average deviation of about  $\pm 0.5$  per cent.

There remain to be considered the data of Thomsen<sup>3,15</sup> who burned oxygen in hydrogen in a flame at constant pressure in a calorimeter at room temperature; of Schuller and Wartha,<sup>1</sup> who burned oxygen in hydrogen in a flame at constant pressure in an ice calorimeter; and of

Mixer,<sup>2, 3</sup> who exploded oxygen and hydrogen at constant volume in a bomb calorimeter. The best of these three sets of data are those of Schuller and Wartha,<sup>1</sup> to which an accuracy of about  $\pm 0.09$  per cent may be attached. The data of these three investigations were reviewed by Lewis,<sup>2</sup> Roth,<sup>10</sup> and Bichowsky,<sup>1</sup> who recommended the following values for the heat of formation of liquid water from gaseous hydrogen and oxygen (corrected to 18°): Lewis, 68.33; Roth, 68.39; Bichowsky, 68.38. Complete details of a recalculation of the calorimetric data of Thomsen,<sup>15</sup> Schuller and Wartha,<sup>1</sup> and Mixer<sup>2, 3</sup> are given in a report by Rossini.<sup>1</sup>

Recently, Rossini<sup>1</sup> determined with considerable accuracy ( $\pm 0.015$  per cent) the heat of formation of water, using a flame calorimeter at constant pressure and burning both oxygen in hydrogen and hydrogen in oxygen. His method was a substitution one, in which the energy from a measured amount of electrical energy was substituted for the energy from a measured amount of chemical reaction, the calorimeter serving as the comparator of the two kinds of energy. Rossini<sup>1</sup> reported  $285,775 \pm 40$  international joules per mole for the reaction at 25° and a constant pressure of 1 atmosphere. Corrected to 18°, and kilocalories, the value becomes  $68.367 \pm 0.010$ . For the present tables, we have rounded off this value to 68.370.

**H<sub>2</sub>O (g).** Values for the heat of vaporization of water were reported by Brix,<sup>1</sup> Regnault,<sup>5, 7, 9</sup> Andrews,<sup>5</sup> Favre and Silbermann,<sup>3</sup> Berthelot,<sup>44</sup> Schall,<sup>1</sup> Dieterici,<sup>1</sup> Griffiths,<sup>2</sup> Louguine,<sup>10</sup> Smith,<sup>3, 4, 5</sup> Joly,<sup>5</sup> Henning,<sup>1, 2, 4</sup> Brown,<sup>1</sup> Richards and Mathews,<sup>1, 2, 3</sup> Carlton-Sutton,<sup>1</sup> Mathews,<sup>3</sup> Wrewsky,<sup>2</sup> Jakob,<sup>1</sup> Osborne, Stimson, and Fiock,<sup>1</sup> and Fiock and Ginnings.<sup>1</sup> The most accurate data are apparently those of the last two named investigations, whose data yield for 18°,  $V = -10.571$ . This value is in agreement with that obtained by Fiock<sup>1</sup> from a recalculation of the earlier data. See also Holborn, Scheel, and Henning.<sup>1</sup>

**H<sub>2</sub>O (c).** Values for the heat of fusion of ice were reported by Black,<sup>1</sup> Laplace and Lavoisier,<sup>1</sup> la Provostaye and Desain,<sup>1</sup> Desain,<sup>1</sup> Regnault,<sup>1, 5</sup> Hess,<sup>11</sup> Person,<sup>1, 3, 5</sup> Leduc,<sup>1</sup> Bunsen,<sup>3, 4</sup> Smith,<sup>4, 5</sup> Behn,<sup>2</sup> Dieterici,<sup>2</sup> Zakrzewsky,<sup>2</sup> Bogojawlensky,<sup>1</sup> Noyes and Sammet,<sup>1</sup> Bridgman,<sup>5</sup> Dickinson and Osborne,<sup>2</sup> and Dickinson, Harper, and Osborne.<sup>1</sup> The data of the last two named investigations are the most accurate and yield the value  $-1.437$  at 0°

**OH (g).** The normal state of the OH molecule is  $^2\pi$ . The next higher electronic energy state is  $^2\Sigma$ , and its energy has been shown by Birge<sup>1</sup> and Jack<sup>1</sup> to be 92.26 above that of the normal level. Bonhoeffer and Reichardt,<sup>1</sup> in an ingenious study of the intensity of lines in the absorption spectra of partially dissociated H<sub>2</sub>O, determined the concentration of gaseous OH in equilibrium in the mixture at various temperatures and pressures. Their data yield for the reaction,  $O_2(g) + 2H_2O(g) = 4OH(g)$ ,  $Q = -134$ ; whence, for OH (g),  $Q_f = -4.6$ . By extrapolating the vibration levels of the  $^2\Sigma$  state of OH, Bonhoeffer and Haber deduced  $D^{\circ} = -70.6$  for the reaction,  $OH(g) (^2\Sigma) = H(g)$  (nor-

mal) + O (g) ( $^2D_1$ ); whence, for OH (g),  $Q_f = 7.5$ . Villars<sup>1</sup> gave, for OH (g) (normal) = O (g) ( $^2D_1$ ) + H (g) (normal),  $D^{\circ} = -138$ , yielding for OH (g),  $Q_f = -17.3$ ; but his method is faulty. From spectroscopic data, Bates<sup>1</sup> found for the dissociation of normal OH into normal atoms of O and H,  $D^{\circ} = -116.05$ , whence, for OH (g),  $Q_f = 5.93$ .

**OH<sup>-</sup> (g).** The heat of formation of OH<sup>-</sup> (g) can be estimated by the method of lattice energies. Using the approximate formula for the lattice energy, with rough estimates of the crystal constants of NaOH, KOH, and RbOH from their densities and molecular weights, we have calculated from the data on these substances, for OH<sup>-</sup> (g),  $Q_f = -64$ ,  $-58$ , and  $-56$ , respectively. Lederle<sup>1</sup> calculated a value of  $-81$ .

**OH<sup>-</sup> (∞).** The heat of formation of OH<sup>-</sup> (∞) is calculable from a knowledge of the heat of neutralization of a strong acid and a strong base at infinite dilution in water. That is to say, the reaction,  $\text{NaOH} (\infty) + \text{HCl} (\infty) = \text{NaCl} (\infty) + \text{H}_2\text{O} (\text{liq.})$ , is equivalent to the reaction  $\text{OH}^- (\infty) + \text{H}^+ (\infty) = \text{H}_2\text{O} (\text{liq.})$ . Rossini<sup>4</sup> critically reviewed the data on heats of neutralization and heats of dilution, and, utilizing the Debye-Hückel theory for extrapolating to infinite dilution, calculated the following heats of neutralization at 18° and infinite dilution in water: KCl, 13.689; KNO<sub>3</sub>, 13.713; NaCl, 13.699; NaNO<sub>3</sub>, 13.720; LiCl, 13.703; LiNO<sub>3</sub>, 13.734. The average value is 13.710, whence for OH<sup>-</sup> (∞),  $Q_f = 54.66$ .

**H<sub>2</sub>O<sub>2</sub> (aq.).** Thomsen<sup>15</sup> measured the heat of reaction of  $(\text{SnCl}_2 + 4\text{HCl}) (500)$  with  $\text{H}_2\text{O}_2 (600)$  and with other oxidizing agents. His recomputed data yield, for  $\text{H}_2\text{O}_2 (600)$ ,  $Q_f = 44.96$ . Thomsen<sup>15</sup> also measured the heat of reaction of  $\text{KMnO}_4 (\text{aq.})$  with  $\text{H}_2\text{O}_2 (\text{aq.})$  and with other reducing agents, but these data are less accurate than the former, and the reactions are not as clear cut. Berthelot<sup>30</sup> measured the heats of reaction of  $\text{BaO}_2 (\text{c}) + \text{HCl} (\text{aq.})$  and of  $\text{SnCl}_4 (\text{aq.}) + \text{BaCl}_2 (\text{aq.}) + 2\text{H}_2\text{O} (\text{liq.})$ ; these data yield, for  $\text{H}_2\text{O}_2 (\text{aq.})$ ,  $Q_f = 44.8$ . Berthelot<sup>62</sup> also measured the heat of decomposition of  $\text{H}_2\text{O}_2$  with  $\text{Ag}_2\text{O}$  as a catalyst, —these data yielding  $Q_f = 46.7$ . Berthelot's<sup>63</sup> data on the reaction of  $\text{H}_2\text{O}_2 (\text{aq.}) + \text{KI} (\text{aq.})$  must be disregarded because of the slowness of the reaction and because of side reactions. Favre and Silbermann<sup>2</sup> measured the decomposition of  $\text{H}_2\text{O}_2$  with Pt as a catalyst, but their data are lacking in accuracy. Recently Matheson and Maass,<sup>1</sup> and Roth, Grau and Meichsner<sup>1</sup> independently measured the heat of decomposition of  $\text{H}_2\text{O}_2 (\text{aq.})$  with  $\text{MnO}_2$  as a catalyst. Their data yield the following values for the heat of formation of  $\text{H}_2\text{O}_2$  in 0, 0.3, 1.8, 2.6, 6.3, 170, and 360  $\text{H}_2\text{O}$ , respectively: 44.84, 44.91, 45.60, 45.63, 45.67, 45.68, and 45.75.

**H<sub>2</sub>O<sub>2</sub> (liq.).** The foregoing data of Matheson and Maass<sup>1</sup> and of Roth, Grau, and Meichsner<sup>1</sup> yield, for the heat of solution of  $\text{H}_2\text{O}_2 (\text{liq.})$  in water,  $S_{200} = 0.88$ ; while the direct measurements of de Forcrand<sup>32</sup> yield  $S_{200} = 0.46$ .

**H<sub>2</sub>O<sub>2</sub> (g).** Maass and Hiebert<sup>1</sup> measured the heat of vaporization of  $\text{H}_2\text{O}_2 (\text{liq.})$  to be 11.61. This direct determination supersedes the value

of 12.3 which was calculated by Lewis and Randall<sup>5</sup> from the uncertain vapor pressure data of Wolfenstein<sup>1</sup> and Bruhl.<sup>1</sup>

$\text{H}_2\text{O}_2$  (c). The data of Maass and Hatcher<sup>1</sup> and Maass and Waldbauer<sup>1</sup> yield  $F = -2.51$  at  $-1.7^\circ$ .

#### FLUORINE

$\text{F}_2$  (g). The energy states of the  $\text{F}_2$  molecule are evaluated from the data of Gale and Monk<sup>1</sup> and Gale.<sup>1</sup> See Jevons.<sup>1</sup>

$\text{F}_2$  (liq.). Cady and Hildebrand,<sup>1</sup> from their own vapor pressure data, computed  $V = -1.60$ <sup>188</sup>. Henglein<sup>1</sup> estimated  $V = -1.44$ .

$\text{F}_2$  (c). Henglein<sup>1</sup> estimated  $F = -0.34$ .

$\text{F}$  (g). The data of von Wartenberg, Sprenger, and Taylor,<sup>1</sup> who measured, spectroscopically, the convergence limit of the vibrational levels of  $\text{F}_2$  (g), yield  $-62.6$  for the energy of dissociation of normal  $\text{F}_2$  (g) into normal fluorine atoms. Earlier estimates of this value were: Birge,<sup>1</sup>  $-70.0$ ; Henglein,<sup>1</sup>  $-63.0$ ; Villars,<sup>1</sup>  $-57$ . See also Franck.<sup>2</sup>

The values for the energy states of gaseous monatomic fluorine are from Dingle,<sup>1, 2</sup> de Bruin,<sup>2</sup> Bowen,<sup>2</sup> Turner,<sup>3</sup> and Laporte and Young.<sup>1</sup> See also Bacher and Goudsmit.<sup>1</sup>

$\text{F}^-$  (g). Extrapolation of the ionization potentials of Ne and  $\text{Na}^+$  gives 135 for the ionization energy of  $\text{F}^-$  (g), the negative of the electron affinity of  $\text{F}$  (g); but this method is known to give values that are too high. A more reliable value can be obtained by the method of lattice energies, utilizing the data on the alkali fluorides. We have computed values of the lattice energies of  $\text{LiF}$ ,  $\text{NaF}$ ,  $\text{KF}$ ,  $\text{RbF}$ , and  $\text{CsF}$  which are identical with those given by Sherman<sup>1</sup> namely: 240.1, 215.0, 190.4, 181.8, and 172.8, respectively. Utilizing the remaining necessary data from our tables, we have computed, for  $\text{F}^-$  (g), the average value,  $Q_f = 66.3$ . This is equivalent to an electron affinity of 98, which is identical with the value given by Lederle.<sup>1</sup> Older values were given by Henglein,<sup>1</sup> Lande,<sup>1</sup> and Turner.<sup>3</sup>

$\text{HF}$  (g). von Wartenberg and Fitzner<sup>1</sup> measured the heat of the reaction between gaseous fluorine and hydrogen to give the gaseous associated molecule  $(\text{HF})_n$ . According to present information, (see Simons and Hildebrand<sup>1</sup>) the association of gaseous hydrogen fluoride is such that, at  $18^\circ$  and a pressure of 745 mm. Hg, the mean molecule is  $(\text{HF})_{3.3}$ . Utilizing the data of Simons and Hildebrand<sup>1</sup> on the reaction,  $6 \text{ HF (g)} = (\text{HF})_6 \text{ (g)}$ , von Wartenberg and Fitzner corrected their observed calorimetric data to give, for  $\text{HF}$  (g) (ideal),  $Q_f = 63.0$ . Later, von Wartenberg and Schutza<sup>1</sup> and Ruff and Laass<sup>1</sup> reported, for  $\text{HF}$  (g) (ideal),  $Q_f = 64.5$  and  $62.3$ , respectively.

$\text{HF}$  (aq.). The earliest determination of the heat of formation of fluorine compounds was made by Berthelot and Moissan,<sup>1</sup> who measured the heat of reaction between fluorine and an aqueous alkaline solution of potassium sulfite; but their data are of historical interest only. Guntz<sup>1</sup> found the heat of solution of hydrogen fluoride to be 11.8; von Wartenberg and Fitzner<sup>1</sup> gave, for  $\text{HF}$  (g) (ideal)  $= \text{HF}$  (aq.),  $Q = 11.56$ . von

Wartenberg and Fitzner<sup>1</sup> also measured the heat of the reaction,  $\frac{1}{2} \text{F}_2 (\text{g}) + \text{NaCl} (\text{c}) = \text{NaF} (\text{c}) + \frac{1}{2} \text{Cl}_2 (\text{g})$ . Combining with this reaction the heat of formation of  $\text{NaCl} (\text{c})$  and the heat of neutralization of  $\text{HF} (\text{aq.})$ , we have obtained, for  $\text{HF} (\text{aq.})$ ,  $Q_f = 77.0$ . The heat of dilution of aqueous  $\text{HF}$  was measured by Guntz<sup>1</sup> and Peterson.<sup>6</sup>

**HF (liq.).** Guntz<sup>1, 5</sup> measured the heat of solution of liquid  $\text{HF}$  in water. He gave  $S = 4.6$ , whence, for  $\text{HF} (\text{liq.})$ ,  $Q_f = 71.0$ . Kolosovskii,<sup>1</sup> from vapor pressure data, computed  $V = -6.3$ , correcting an earlier calculation by Simons.<sup>1</sup> In a recent investigation, Fredenhagen<sup>1</sup> found  $V = -6.05$  at  $15^\circ$ .

**HF (c).** Dahmlos and Jung<sup>1</sup> reported  $F = -1.09$ .

**(HF)<sub>6</sub> (g).** Simons and Hildebrand<sup>1</sup> studied the equilibrium,  $6\text{HF} (\text{g}) = (\text{HF})_6 (\text{g})$ , and concluded that  $Q = 40.0$ . They assumed that no other molecular species exist in gaseous hydrogen fluoride.

**F<sup>-</sup> (aq.).** From the values of the heats of formation of  $\text{LiF} (\infty)$ ,  $\text{NaF} (\infty)$ ,  $\text{KF} (\infty)$ , and of  $\text{Li}^+ (\infty)$ ,  $\text{Na}^+ (\infty)$ , and  $\text{K}^+ (\infty)$ , we have computed, for  $\text{F}^- (\infty)$ ,  $Q_f = 78.21$ ,  $78.13$ , and  $78.23$ , respectively.

**HF<sub>2</sub><sup>-</sup> (aq.).** From the values of the heats of formation of aqueous  $\text{LiHF}_2$ ,  $\text{NaHF}_2$ , and  $\text{KHF}_2$  at infinite dilution (assuming no dissociation of  $\text{HF}_2^-$ ) we have obtained, for  $\text{HF}_2^- (\infty)$ ,  $Q_f = 153.67$ ,  $153.37$ , and  $153.40$ , respectively.

**F<sub>2</sub>O (g).** von Wartenberg and Klinkott<sup>1</sup> found for the reaction,  $\text{F}_2\text{O} (\text{g}) + 2\text{KOH} (4.67) = 2\text{KF} (4.67) + 2\text{H}_2\text{O} (\text{liq.}) + \text{O}_2 (\text{g})$ ,  $Q = 251.8 \pm 1.0$ ; whence, for  $\text{F}_2\text{O} (\text{g})$ ,  $Q_f = -6.7$ . von Wartenberg and Klinkott<sup>1</sup> also measured the heats of the reactions,  $\text{F}_2\text{O} (\text{g}) + 6\text{KI} (\text{aq.}) + 2\text{HF} (\text{aq.}) = (4\text{KF} + 3\text{KI}_3) (\text{aq.}) + \text{H}_2\text{O} (\text{liq.})$  and, at about the same concentration,  $2\text{Cl}_2 (\text{g}) + 6\text{KI} (\text{aq.}) = (2\text{KI}_3 + 4\text{KCl}) (\text{aq.})$ , finding, respectively,  $Q = 176.4$  and  $103$ . Combination of these reactions leads to a value of  $-4.8$  for the heat of formation of  $\text{F}_2\text{O} (\text{g})$ . von Wartenberg and Klinkott<sup>1</sup> also measured the heats of the reactions,  $\text{F}_2\text{O} (\text{g}) + 4\text{HBr} (\text{aq.}) = 2\text{HF} (\text{aq.}) + 2\text{Br}_2 (\text{liq.}) + \text{H}_2\text{O} (\text{liq.})$  and  $2\text{Cl}_2 (\text{g}) + 4\text{HBr} (\text{aq.}) = 4\text{HCl} (\text{aq.}) + 2\text{Br}_2 (\text{liq.})$ , finding, respectively,  $Q = 134.8$  and  $49.1$ . These data give, for  $\text{F}_2\text{O} (\text{g})$ ,  $Q_f = -5.7$ . von Wartenberg and Klinkott<sup>1</sup> reported that Ruff measured the heat of the reaction,  $2\text{H}_2 (\text{g}) + 2\text{NaOH} (\text{aq.}) + \text{F}_2\text{O} (\text{g}) = 2\text{NaF} (\text{aq.}) + 3\text{H}_2\text{O} (\text{liq.})$ , and gave, from this source,  $Q_f = -4.6$ .

## CHLORINE

**Cl<sub>2</sub> (g).** The standard state is taken as the equilibrium gas at  $18^\circ$ , containing the natural mixture of isotopes. The energy states of the diatomic chlorine molecule are evaluated from the data of Elliott,<sup>1, 2</sup> and the discussion of Mulliken.<sup>6</sup> See also Jevons.<sup>1</sup>

**Cl<sub>2</sub> (liq.).** The heat of vaporization of liquid chlorine was measured by Estreicher and Schneer,<sup>3</sup> Knietsch,<sup>1</sup> Pellaton,<sup>1</sup> Trautz and Gerwig,<sup>1</sup> Johnson and McIntosh,<sup>1</sup> Wohl,<sup>2</sup> and Eucken, Karwat, and Fried.<sup>1</sup> See also Harteck.<sup>1</sup>

**Cl<sub>2</sub> (c).** The heat of fusion of chlorine was investigated by Estreicher

and Staniewski,<sup>1</sup> Estrieher and Schnee,<sup>1</sup> Eucken and Karwat,<sup>1</sup> and Harteck.<sup>2</sup> See also Rideal.<sup>1</sup> We have taken Eucken and Karwat's<sup>1</sup> value,  $F = -1.62$  at  $-102^\circ$ .

**Cl (g).** The heat of dissociation of  $\text{Cl}_2$  (g) into atoms can be determined in several ways. Pier<sup>1</sup> and Wohl,<sup>2, 3</sup> utilizing data on the instantaneous pressure developed in a closed bomb by explosion of  $\text{H}_2 + \text{Cl}_2$ , or  $\text{H}_2\text{O} + \text{Cl}_2$ , computed thermodynamically the heat of dissociation. Pier's<sup>1</sup> values were preliminary; Wohl<sup>2, 3</sup> reported  $D = -57.0$ . The values from the explosion method are in accord with those deduced from the data of Henglein,<sup>1</sup> Trautz and Geissler,<sup>1</sup> von Wartenberg and Wiegel,<sup>1</sup> and von Wartenberg and Henglein,<sup>1</sup> all of whom measured the vapor density of gaseous chlorine at various high temperatures. These data on the equilibrium,  $\text{Cl}_2$  (g)  $= 2$  Cl (g), yield  $D = -54.0$  and  $-59.5$ . Trautz and Stackels<sup>1</sup> earlier value,  $-71.0$ , from vapor density data, is evidently in error. The most accurate value for the energy of dissociation of the normal diatomic chlorine molecule into two normal chlorine atoms is obtained from the spectroscopic data of Kuhn,<sup>1</sup> who interpreted a band limit at 4758 Angstrom units as the dissociation of  $\text{Cl}_2$  (g) (normal) into Cl (g) ( $^2\text{P}_1$ ) + Cl (g) ( $^2\text{P}_2$ ). Correcting to the normal state gives  $D^\circ = -56.9$ . Kuhn's<sup>1</sup> interpretation of the band limit was corroborated by Senftleben and Germer.<sup>1</sup>

The values for the energy states of gaseous monatomic chlorine are from Kiess and de Bruin,<sup>1</sup> Muraka,<sup>1, 2</sup> Bowen,<sup>4</sup> Paschen,<sup>7</sup> and Bowen and Millikan.<sup>1</sup> See also Bacher and Goudsmit.<sup>1</sup>

**Cl<sup>-</sup> (g).** Plotting the square root of the ionization potentials of A, K<sup>+</sup>, and Ca<sup>++</sup> against the atomic number, and extrapolating to Cl<sup>-</sup>, yields  $-65$  for the energy of ionization of Cl<sup>-</sup> (g). This is equivalent to the negative of the electron affinity of Cl (g). The heat of the reaction, Cl (g) +  $\theta$  = Cl<sup>-</sup> (g), can also be calculated by way of the lattice energies of LiCl, NaCl, KCl, RbCl, and CsCl. Using our own values for the auxiliary data, we have computed from these substances the following values for Cl<sup>-</sup> (g):  $Q_f = 62.1, 63.2, 61.2$ , and  $63.7$ , respectively. Similar calculations, varying but slightly from the foregoing in the values obtained, were made by Lennard-Jones<sup>1</sup> and Sherman.<sup>2</sup> Lederle,<sup>1</sup> from data on the absorption spectra of gaseous KCl, PbCl, and CsCl, calculated the electron affinity of Cl (g), and his values yield, respectively, for Cl<sup>-</sup> (g),  $Q_f = 60.4, 61.6$ , and  $60.2$ .

**Cl<sup>-</sup> ( $\infty$ ).** Since we have adopted the convention of making  $Q_f = 0$  for  $\text{H}^+$  ( $\infty$ ), the value for the heat of formation of Cl<sup>-</sup> ( $\infty$ ) is identical with that for HCl ( $\infty$ ).

**Cl<sub>3</sub> (g).** The existence of this substance is still hypothetical and depends mostly on an interpretation of some rate of reaction experiments by Bodenstein and Plaut,<sup>1</sup> who assumed the reaction,  $3 \text{Cl}_2$  (g)  $= 2 \text{Cl}_3$  (g), and gave  $Q = -51$ .

**Cl<sub>2</sub> (aq.) (ideal).** Chlorine gas dissolved in water is in part hydrolyzed to form HCl and HClO. In addition, aqueous chlorine solutions decom-

pose slowly, evolving gaseous HCl and O<sub>2</sub>. One can, however, consider that this last reaction is negligible in the observed calorimetric experiment of dissolving chlorine gas in water, and make proper correction for the amount of the reaction,  $\text{Cl}_2 (\text{aq.}) + \text{H}_2\text{O} (\text{liq.}) = (\text{HCl} + \text{HClO}) (\text{aq.})$ , which has occurred at the given temperature and concentration. Jakowkin<sup>1</sup> gave the equilibrium constant for this latter reaction, whence one can compute the amount of Cl<sub>2</sub> hydrolyzed and thence the correction which must be applied to the observed heat of solution in order to obtain the heat of the pure reaction without hydrolysis:  $\text{Cl}_2 (\text{g}) = \text{Cl}_2 (\text{aq.})$  (ideal). Thomsen<sup>15</sup> found  $S_{1000} = 4.87$ ; Baker,<sup>2</sup>  $S_7^\circ = 4.97$ ; Berthelot,<sup>26, 67, 151</sup>  $S_7^\circ = 7.4$ . According to Jakowkin's<sup>1</sup> data on the hydrolysis constant for 18°, the chlorine in Thomsen's solution was 40 per cent hydrolyzed. Making correction for this amount of hydrolysis, we have calculated, for Cl<sub>2</sub> (aq.) (ideal),  $Qf = 7.0$ . Utilizing, instead of the calorimetrically observed heat of solution, a value obtained from the temperature coefficient of solubility for Cl<sub>2</sub> in water, Jakowkin<sup>1</sup> calculated, for Cl<sub>2</sub> (aq.) (ideal),  $Qf = 7.1$ . On recalculating his data, we have obtained 7.0. Roth<sup>12</sup> reviewed all the foregoing data and recommended the value 6.9.

**Cl<sub>2</sub> (CCl<sub>4</sub>).** Noyes and Tulley<sup>1</sup> measured the heat of solution of chlorine in carbon tetrachloride at 0°.

**ClO<sub>2</sub> (g).** From explosion experiments, Booth and Bowen<sup>1</sup> found for ClO<sub>2</sub> (g),  $Qf = -23.5$ . Mayer<sup>4</sup> interpreted a predissociation band in the spectra of chlorine dioxide as due to the reaction  $\text{ClO}_2 (\text{g}) = \text{Cl} (\text{g}) + \text{O}_2 (\text{g})$ , and gave  $Q = 3.6$ ; whence, for ClO<sub>2</sub> (g),  $Qf = -25.15$ . This is a verification of the values of the heats of formation of both Cl (g) and ClO<sub>2</sub> (g).

**ClO<sub>2</sub> (aq.).** Booth and Bowen<sup>1</sup> reported  $S = 6.60$ .

**ClO<sub>2</sub> (liq.).** King and Partington<sup>1</sup> reported the heat of vaporization.

**HClO<sub>2</sub> (aq.).** The heat of solution of ClO<sub>2</sub> (g) in water is supposed to correspond to the reaction,  $2 \text{ClO}_2 (\text{g}) + \text{H}_2\text{O} (\text{liq.}) = (\text{HClO}_3 + \text{HClO}_2) (\text{aq.})$ . Anticipating the value of  $Qf$  for HClO<sub>3</sub> (aq.), we have obtained, for HClO<sub>2</sub> (aq.),  $Qf = 13.8$ .

**ClO<sub>2</sub><sup>-</sup> (aq.).** Assuming that aqueous HClO<sub>2</sub> is completely ionized, one finds, for ClO<sub>2</sub><sup>-</sup> (aq.),  $Qf = 13.8$ .

**ClO (g).** Finkelnburg and Schumacker,<sup>1</sup> from spectral data, gave for the reaction,  $\text{ClO}_2 (\text{g}) = \text{ClO} (\text{g}) + \text{O} (\text{g})$  (<sup>1</sup>D),  $Q = -111$ .

**Cl<sub>2</sub> · 7H<sub>2</sub>O (c).** Even though a hydrate of chlorine has been known for over a century, there is still some uncertainty as to its composition. Roozeboom<sup>3</sup> believed the compound to be the octahydrate; de Forcrand,<sup>38</sup> the heptahydrate. de Forcrand<sup>38</sup> measured the heat of solution of a weighed amount of the hydrate in water, and, correcting for the variation of the composition of the compound from the supposed heptahydrate, obtained  $S^3 = -15.87$ ,  $-15.27$ , and  $-15.76$ . At the same temperature and concentration, de Forcrand found, for Cl<sub>2</sub> (g),  $S^3 = 2.94$ ; whence, for Cl<sub>2</sub> (g) + 7H<sub>2</sub>O (liq.) = Cl<sub>2</sub> · 7H<sub>2</sub>O (c),  $Q^3 = 18.6$ . In somewhat rougher experiments, LeChatelier<sup>3, 5</sup> found for this latter reaction  $Q = 17.0$ . From

the equilibrium data of Isambert,<sup>4</sup> LeChatelier,<sup>5</sup> and Roozeboom,<sup>2, 4</sup> de Forcrand<sup>38</sup> computed, for this reaction,  $Q=18.8$ ,  $17.8$ , and  $17.8$ , respectively. See also Tammann and Krige.<sup>1</sup> We have selected the value  $18.0$ , giving more weight to the values from the equilibrium data.

**HCl (g).** Calorimetric determinations of the heat of formation of gaseous hydrogen chloride were made by Abria,<sup>1</sup> Favre and Silbermann,<sup>1</sup> Berthelot,<sup>181</sup> Thomsen,<sup>15</sup> Roth and Richter,<sup>1</sup> von Wartenberg and Hanisch,<sup>1</sup> and Rossini.<sup>10</sup> The values of Abria<sup>1</sup> and Favre and Silbermann,<sup>1</sup>  $24.0$  and  $23.8$  respectively, are now only of historical interest. The only information that we have been able to obtain concerning Berthelot's<sup>181</sup> work on this problem is that he quoted Thomsen's<sup>15</sup> value and wrote "J'ai obtenu le meme chiffre." Thomsen<sup>15</sup> burned chlorine in hydrogen at constant pressure in a flame calorimeter. The detailed data of his four calorimetric experiments have been recomputed and yield, for HCl (g),  $Q_f=21.99\pm0.05$ . Thomsen determined the amount of reaction in each experiment by absorbing the HCl and titrating with aqueous barium hydroxide.

von Wartenberg and Hanisch<sup>1, 2</sup> performed similar experiments and reported, for HCl (g),  $Q=21.90\pm0.01$  at  $24^\circ$ . The amount of reaction in each experiment was computed from the loss in weight of the chlorine bottle. Roth and Richter<sup>1</sup> reported the results of three series of calorimetric experiments on the combination of hydrogen and chlorine by explosion at constant volume at  $21^\circ$ : Series I,  $21.82\pm0.06$ , amount of reaction determined by titrating the hydrogen chloride formed; Series II,  $22.02\pm0.02$ , chlorine in excess, amount of reaction determined from volume, pressure, and temperature of the hydrogen used in the reaction; Series III,  $21.87\pm0.03$ , hydrogen chloride titrated. Roth and Richter<sup>1</sup> concluded that the third series was the most accurate and best represented the results of their work.

Rossini<sup>10</sup> burned chlorine in hydrogen at constant pressure in a flame calorimeter, using the apparatus with which he made the accurate measurements on the heat of formation of water. He reported, for HCl (g),  $Q_f^{25}=22.063\pm0.012$ ; whence, at  $18^\circ$ ,  $Q_f=22.060\pm0.012$ . The amount of reaction in each experiment was determined by absorbing the HCl formed in a soda-asbestos mixture. In the same paper, Rossini<sup>10</sup> made a detailed calculation of the heat of formation of gaseous HCl utilizing the thermodynamic relation  $\Delta H=\Delta F+T\Delta S$ . He obtained the value of  $\Delta S$ , the entropy of formation, from the recently obtained accurate values of the entropies of  $H_2$ ,  $Cl_2$ , and HCl from spectroscopic data by Giauque and coworkers; and the value of  $\Delta F$ , the free energy of formation, from the electromotive force of cells giving the reactions,  $\frac{1}{2}H_2(g)+AgCl(c)=Ag(c)+HCl(aq.)$  and  $Ag(c)+\frac{1}{2}Cl_2(g)=AgCl(c)$ , and the vapor pressure of HCl over aqueous HCl. In this manner Rossini<sup>10</sup> computed, for HCl (g),  $Q_f^{25}=22.026\pm0.033$ , which value is in accord, within its limits of uncertainty, with his directly measured calorimetric value. See also the discussion under HCl (aq.).

**HCl (liq.).** The heat of vaporization of HCl was measured by Elliott and McIntosh,<sup>1</sup> Steele, McIntosh, and Archibald,<sup>1</sup> Estreicher and Schneer,<sup>1</sup> and Giauque and Wiebe.<sup>1</sup> The value from Giauque and Wiebe<sup>1</sup> is accepted as being the most accurate. Tsurita<sup>1</sup> calculated  $V = -2.38$ . The vapor pressure of liquid HCl was measured by Faraday,<sup>1</sup> Ansdell,<sup>1</sup> McIntosh and Steele,<sup>1</sup> Briner,<sup>4</sup> Drozdowski and Pietrzak,<sup>1</sup> Cardoso and Germann,<sup>1</sup> and Henning and Stock.<sup>1</sup>

**HCl (c, I).** Giauque and Wiebe<sup>1</sup> and Eucken and Karwat<sup>1</sup> found, by direct measurement,  $F = -0.504$  and  $-0.476$ , respectively. The data of Eucken and Donath,<sup>1</sup> Eucken and Karwat,<sup>1</sup> and Giauque and Wiebe,<sup>1</sup> on the vapor pressure of solid and liquid HCl in the neighborhood of the triple point, yield  $F = -0.498$ .

**HCl (c, II).** Giauque and Wiebe<sup>1</sup> and Eucken and Karwat<sup>1</sup> found, respectively,  $T_{\rightarrow I} = -0.284$  and  $-0.293$ .

**HCl<sup>+</sup> (g).** Foote and Mohler<sup>1</sup> gave for the energy of ionization of HCl (g) to form HCl<sup>+</sup> (g) the value 14.0 volt-electrons; Barton<sup>1</sup> reported 13.8 volt-electrons. Other values were reported by Kemble,<sup>1</sup> Knipping,<sup>1,2</sup> Franck,<sup>1</sup> Mackay,<sup>1,2</sup> and Barker and Duffendack.<sup>1</sup>

**HCl (aq.).** The data on the heat of dilution of aqueous HCl in the dilute region (Richards and Rowe,<sup>1</sup> Richards, Mair, and Hall,<sup>1</sup> Muller,<sup>1</sup> von Steinwehr,<sup>1</sup> and Wrewskii and Savaritzkii<sup>1</sup>) were reviewed by Ros-sini,<sup>5</sup> who gave values from  $\infty$  to 25 H<sub>2</sub>O. The data of Wrewskii and Savaritzkii,<sup>1</sup> Thomsen,<sup>15</sup> and Berthelot,<sup>17,18</sup> have been utilized to obtain values from 25 to 1 H<sub>2</sub>O. Other data were given by Ellis,<sup>1</sup> Harned and Brumbaugh,<sup>1</sup> Tucker,<sup>1</sup> Richards, Rowe, and Burgess,<sup>1</sup> and Payn and Perman.<sup>1</sup>

The heat of solution of gaseous HCl in water was measured by Thomsen,<sup>15</sup> Berthelot and Louguine,<sup>1</sup> and Wrewskii and Savaritzkii.<sup>1</sup> Their data yield for  $S_{200}$ : 17.20, 17.5, and 17.38, respectively. Combination of the last value with the heat of dilution from 200 to  $\infty$  H<sub>2</sub>O, and with the heat of formation of the gas, yields, for HCl ( $\infty$ ),  $Q_f = 39.66$  (See Ros-sini<sup>10</sup>). Older data on the heat of solution of HCl were obtained by Favre and Silbermann,<sup>1,3</sup> Favre,<sup>6</sup> and Abria.<sup>2</sup> See also Wilke and Kieninger<sup>1</sup> and Wrewskii and Faerman.<sup>1</sup>

The heat of formation of aqueous HCl can also be computed (see Rossini<sup>10</sup>) from the temperature coefficient of the electromotive force of certain cells and the heats of formation of silver chloride and mercurous chloride. Lewis and Randall,<sup>2</sup> Ellis,<sup>1</sup> and Harned and Brumbaugh<sup>1</sup> measured at a series of temperatures the electromotive force of cells in which the reaction was  $\frac{1}{2} \text{H}_2 (\text{g}) + \text{HgCl} (\text{c}) = \text{Hg} (\text{liq.}) + \text{HCl} (\text{aq., } m)$ , and computed the heat of the reaction. Addition to this quantity of the heat of formation of HgCl (c), and the partial molal heat of dilution of HCl from the molality  $m$  to infinite dilution, yields values for the reaction,  $\frac{1}{2} \text{H}_2 (\text{g}) + \frac{1}{2} \text{Cl}_2 (\text{g}) = \text{HCl} (\infty)$ . From the foregoing data, we have obtained the average value, for HCl ( $\infty$ ),  $Q_f = 39.71$ . In a similar manner Noyes and Ellis,<sup>1</sup> Harned and Brumbaugh,<sup>1</sup> and Butler and Rob-

ertson<sup>1</sup> obtained values for the heat of the reaction  $\frac{1}{2} \text{H}_2 (\text{g}) + \text{AgCl} (\text{c}) = \text{Ag} (\text{c}) + \text{HCl aq., } m$ ). And from their data we have computed, for  $\text{HCl} (\infty)$ , the average value  $Q_f = 39.63$ . See Rossini.<sup>10</sup>

**HCl (C<sub>2</sub>H<sub>5</sub>OH).** Berthelot<sup>152</sup> measured the heat of solution of gaseous HCl in ethyl alcohol.

**HCl (CCl<sub>4</sub>).** Noyes and Tulley<sup>1</sup> measured the heat of solution of gaseous HCl in carbon tetrachloride.

**HCl · 2 H<sub>2</sub>O (c).** Berthelot<sup>47</sup> measured the heats of solution of the solid and of the liquid in water. The difference in the observed heats of solution, for the same temperatures and concentration, gives the heat of the reaction,  $\text{HCl} \cdot 2 \text{H}_2\text{O} (\text{c}) = \text{HCl} (2) + 2 \text{H}_2\text{O} (\text{liq.})$ ,  $Q = -2.5$ . Vapor pressure data on the system HCl–H<sub>2</sub>O were reported by Roozeboom.<sup>3, 5</sup>

**HClO (aq.).** Thomsen<sup>15</sup> measured the heats of the reactions:

- (1),  $\text{Cl}_2 (\text{g}) + 2 \text{NaOH} (400) = (\text{NaCl} + \text{NaClO}) (800) + \text{H}_2\text{O} (\text{liq.})$ ;
- (2),  $\text{NaOH} (400) + \text{HClO} (400) = \text{NaClO} (800) + \text{H}_2\text{O} (\text{liq.})$ ;
- (3),  $\text{NaOH} (400) + \text{HCl} (400) = \text{NaCl} (800) + \text{H}_2\text{O} (\text{liq.})$ ;
- (4),  $\text{NaCl} (400) + \text{NaClO} (400) = (\text{NaCl} + \text{NaClO}) (800)$ ;
- (5),  $\text{NaCl} (400) = \text{NaCl} (800)$ ; and
- (6),  $\text{NaClO} (400) = \text{NaClO} (800)$ .

Subtraction of (2) + (3) + (4) from (1) + (5) + (6) yields  $\text{Cl}_2 (\text{g}) + \text{H}_2\text{O} (\text{liq.}) = \text{HCl} (400) + \text{HClO} (400)$ . Our recalculation of Thomsen's data on the above reactions yields, for  $\text{HClO} (400)$ ,  $Q_f = 29.76$ . Thomsen also measured the heat of the reaction,  $\text{HClO} (400) + (2 \text{HCl} + 2 \text{KI}) (400) = (2 \text{KCl} + \text{HCl}) (800) + \text{H}_2\text{O} (\text{liq.}) + \text{I}_2 (\text{c})$ . From his data on this reaction, we have computed, for  $\text{HClO} (400)$ ,  $Q_f = 29.79$ . Recently, Neumann and Muller<sup>2</sup> measured the heats of the reactions,  $\text{Cl}_2 (\text{g}) + 2 \text{MOH} (\text{aq.}) = (\text{MCl} + \text{MClO}) (\text{aq.}) + \text{H}_2\text{O} (\text{liq.})$  and  $\text{MOH} (\text{aq.}) + \text{HClO} (\text{aq.}) = \text{MClO} (\text{aq.}) + \text{H}_2\text{O} (\text{liq.})$ , where M was Li, Na, K,  $\frac{1}{2} \text{Ca}$ ,  $\frac{1}{2} \text{Sr}$ , and  $\frac{1}{2} \text{Ba}$ , respectively. With these data one can compute the heat of the reaction  $\text{Cl}_2 (\text{g}) + \text{MOH} (\text{aq.}) = \text{HClO} (\text{aq.}) + \text{MCl} (\text{aq.})$ . Utilized in this manner, the foregoing data of Neumann and Muller yield six values for the heat of formation of  $\text{HClO} (\text{aq.})$ , the average being 30.4. In view of the fact that Neumann and Muller did not give their experimental measurements of the heat of neutralization of  $\text{MOH} (\text{aq.}) + \text{HCl} (\text{aq.})$ , and reported no values for the pertinent heats of mixing and dilution, we have selected the value from Thomsen's data. The heat of dilution of aqueous  $\text{HClO}$  was measured by Neumann and Muller.<sup>2</sup>

**Cl<sub>2</sub>O (g).** Thomsen<sup>15</sup> and Neumann and Muller<sup>2</sup> found for the heat of solution in water the values 9.44<sub>800</sub> and 8.74<sub>2070</sub>, respectively. Because we have selected the value of  $\text{HClO} (\text{aq.})$  from Thomsen's data, we have also, to be consistent, taken his value for the heat of solution of  $\text{Cl}_2\text{O} (\text{g})$  in water to form  $\text{HClO} (\text{aq.})$ . Recently, Gunther and Wekua<sup>1</sup> measured the heat of explosion of  $\text{Cl}_2\text{O}$ , their data yielding, for  $\text{Cl}_2\text{O} (\text{g})$ ,  $Q_f = -25.1$ . Our selected value is  $-18.2$ . The discrepancy may lie in a systematic error of the nature of the formation of ozone in the experiments of Gunther and Wekua.<sup>1</sup>

$\text{Cl}_2\text{O}$  (aq.). As Goldschmidt<sup>1</sup> pointed out, solutions of aqueous  $\text{HClO}$  more concentrated than about  $\text{HClO}$  (50) contain appreciable amounts of free unhydrated  $\text{Cl}_2\text{O}$ , in the equilibrium,  $2\text{HClO}$  (aq.)  $=$   $\text{H}_2\text{O}$  (aq.) +  $\text{Cl}_2\text{O}$  (aq.). The data of Roth<sup>12</sup> and Goldschmidt<sup>1</sup> on the equilibrium constant at various temperatures yield  $-8.0$  for the heat of the foregoing reaction.

$\text{HClO}_3$  (aq.). Thomsen<sup>15</sup> measured the heat of the reaction,  $\text{HClO}_3$  (1200) +  $3\text{H}_2\text{SO}_3$  (400)  $=$  ( $3\text{H}_2\text{SO}_4 + \text{HCl}$ ) (2400), obtaining as the average from three experiments,  $Q = 206.3$ . From these data, we have calculated, for  $\text{HClO}_3$  (aq.),  $Q_f = 24.6$ . Berthelot<sup>79</sup> measured the heats of the reactions,  $\text{Ba}(\text{ClO}_3)_2$  (200) +  $6\text{H}_2\text{SO}_3$  (aq., satd.)  $=$   $\text{BaSO}_4$  (c) + ( $5\text{H}_2\text{SO}_4 + 2\text{HCl}$ ) (aq.), and  $\text{Ba}(\text{ClO}_3)_2$  (200) +  $\text{H}_2\text{SO}_4$  (400) +  $2\text{HClO}_3$  (300)  $=$   $\text{BaSO}_4$  (c). Thomsen<sup>15</sup> also measured the heat of this last reaction. From these data, we have computed, for  $\text{HClO}_3$  (aq.),  $Q_f = 20.8$ . This latter value we have taken as the best for aqueous  $\text{HClO}_3$  because the reactions involved are clear cut and rapid, as contrasted with the reaction between chloric and sulfurous acids.

$\text{HClO}_4$  (aq.). Berthelot<sup>79</sup> measured the heat of neutralization of aqueous  $\text{HClO}_4$  with  $\text{KOH}$  (660), his data yielding  $N = 14.25_{1320}$ . Taking the heat of formation of  $\text{KClO}_4$  (aq.) as known, we have computed, for  $\text{HClO}_4$  (660),  $Q_f = 39.6$ . Berthelot<sup>79, 80</sup> measured the heat of dilution of aqueous  $\text{HClO}_4$ .

$\text{HClO}_4$  (liq.). Berthelot<sup>79, 80</sup> measured the heat of solution.

$\text{HClO}_4 \cdot \text{H}_2\text{O}$  (c). Berthelot<sup>79, 80</sup> measured the heat of solution.

$\text{ClO}^-$  (aq.). The data on the heats of formation of aqueous  $\text{LiClO}$ ,  $\text{NaClO}$ , and  $\text{KClO}$ , and of aqueous  $\text{Li}^+$ ,  $\text{Na}^+$ , and  $\text{K}^+$  yield, for  $\text{ClO}^-$  (aq.),  $Q_f = 25.77$ ,  $25.92$ , and  $25.93$ , respectively.

$\text{ClO}_3^-$  ( $\infty$ ). From the data on the heats of formation of  $\text{NaClO}_3$  ( $\infty$ ) and  $\text{Na}^+$  ( $\infty$ ), we have obtained, for  $\text{ClO}_3^-$  ( $\infty$ ),  $Q_f = 20.75$ .

$\text{ClO}_4^-$  ( $\infty$ ). From the data on the heats of formation of  $\text{NaClO}_4$  ( $\infty$ ),  $\text{Na}^+$  ( $\infty$ ),  $\text{KClO}_4$  ( $\infty$ ), and  $\text{K}^+$  ( $\infty$ ), we have obtained, for  $\text{ClO}_4^-$  ( $\infty$ ),  $Q_f = 39.35$  and  $39.60$ , respectively.

$\text{ClF}$  (g). Fredenhagen and Krefft<sup>1</sup> observed that heat is evolved when  $\text{Cl}_2$  and  $\text{F}_2$  are mixed. Ruff and Laass<sup>1</sup> measured the heats of the reactions,  $\text{ClF}$  (g) +  $\text{H}_2$  (g)  $=$   $\text{HCl}$  (g) +  $\text{HF}$  (g) and  $1/2\text{F}_2$  (g) +  $1/2\text{H}_2$  (g)  $=$   $\text{HF}$  (g); and their data yield, for  $\text{ClF}$  (g),  $Q_f = 25.7$ .

$\text{ClF}$  (liq.). Ruff and Laass<sup>1</sup> computed, from vapor pressure data,  $V = -2.27$  at  $-101^\circ$ .

## BROMINE

$\text{Br}_2$  (liq.). Standard state.

$\text{Br}_2$  (g). The heat of vaporization of liquid bromine was measured directly by Andrews,<sup>5, 10</sup> Berthelot and Ogier,<sup>8</sup> Le Chatelier,<sup>4</sup> Regnault,<sup>7</sup> and Thomsen.<sup>15</sup> Vapor pressure data were reported by Scheffer and Voogd,<sup>1</sup> Bouzat and Letuan,<sup>1</sup> Cuthbertson and Cuthbertson,<sup>1</sup> Isnardi,<sup>1</sup> Ramsey and Young,<sup>1</sup> and Roozeboom.<sup>3, 5</sup> All the foregoing data agree

with the equation given by Lewis and Randall<sup>5</sup>:  $V = -10.45 + 0.0096(t + 273.1)$ .

**Br<sub>2</sub> (c).** Regnault<sup>2</sup> measured directly  $F = -2.53$ . This value is in accord with the heat of sublimation computed from the vapor pressure data on solid bromine of Braune,<sup>1</sup> Isnardi,<sup>1</sup> Ramsay and Young,<sup>1</sup> Cuthbertson and Cuthbertson,<sup>1</sup> Henglein,<sup>2</sup> and Henglein, Rosenberg, and Muchlinski.<sup>1</sup> See also Rideal.<sup>1</sup>

**Br (g).** Perman and Atkinson<sup>1, 2</sup> and Bodenstein and Cramer<sup>1</sup> measured the vapor density of bromine gas at various elevated temperatures, and computed values of the equilibrium constant for the reaction,  $\text{Br}_2(\text{g}) = 2\text{Br}(\text{g})$ . Lewis and Randall<sup>5</sup> reviewed the work of Perman and Atkinson<sup>1, 2</sup> and deduced for this reaction:  $Q = -41.60 - 0.0026(t + 273.1)$ . The data of Bodenstein and Cramer<sup>1</sup> yield  $Q = -46.10 - 0.0026(t + 273.1)$ . DeVries and Rodebush<sup>1</sup> gave  $Q = -41.2$ . None of these values compare in accuracy with that obtained from spectroscopic analysis. Kuhn<sup>1</sup> reported for the above reaction  $D^\circ = -45.2$ . Kuhn's interpretation of the spectroscopic data has been corroborated by Senftleben and Germer.<sup>1</sup> In a similar manner, Brown<sup>3</sup> recently deduced the accurate value  $D^\circ = -45.24 \pm 0.07$ .

The values for the energy states of gaseous monatomic bromine are from Kiess and de Bruin,<sup>2</sup> Turner,<sup>1</sup> and Deb.<sup>1</sup> See also Bacher and Goudsmit.<sup>1</sup>

**Br<sup>-</sup> (g).** The electron affinity of Br (g) is calculable by the method of lattice energies. Selecting the crystal RbBr, because Rb<sup>+</sup> and Br<sup>-</sup> have exactly the same nuclear structure, and taking the exponent of the repulsive term to be 10, we have computed, for the reaction,  $\text{RbBr}(\text{c}) = \text{Rb}^+(\text{g}) + \text{Br}^-(\text{g})$ ,  $D^\circ = -151.2$ ; whence the electron affinity of Br (g) becomes 87.9. Using the lattice energies of the alkali bromides as calculated by Sherman,<sup>1</sup> we have computed the values 89.6, 85.6, 84.6, 83.6, and 89.6, respectively. Butkow,<sup>1</sup> from the spectra of gaseous TlBr, deduced the value 86.5. From data on the absorption spectra of the alkali halides, Lederle<sup>1</sup> obtained the value 82. See also Lennard-Jones.<sup>2</sup>

**Br<sub>2</sub> (aq.).** Bromine, like chlorine, is hydrolyzed in water. From the heat of the hydrolysis reaction, and the value given by Bray and Connolly<sup>1</sup> for the hydrolysis constant at 25°, we have computed  $K^{18}$  (hydrolysis) =  $\frac{(\text{H}^+)(\text{Br}^-)(\text{HBrO})}{(\text{Br}_2)} = 2.2 \times 10^{-9}$ . The heat of solution of liquid

bromine in water was measured by Le Chatelier,<sup>4</sup> Berthelot,<sup>98</sup> Pickering,<sup>8</sup> and Thomsen.<sup>15</sup> The last three investigators used 1 mole of Br<sub>2</sub> per 300, 5400, and 700 moles of water, and, correcting their data for the amount of bromine hydrolyzed, we have computed  $S = 1.2$ ,  $-0.9$ , and  $1.24$ . Berthelot<sup>98</sup> also measured the heat of solution of liquid bromine in dilute aqueous HCl, where the hydrolysis would be suppressed, finding  $S = 1.1$ .

**Br<sub>2</sub> (CCl<sub>4</sub>), Br<sub>2</sub> (CHCl<sub>3</sub>), Br<sub>2</sub> (CS<sub>2</sub>).** Pickering<sup>8</sup> measured the heat of solution of liquid bromine in carbon tetrachloride, chloroform, and carbon disulfide, respectively.

$\text{Br}_2 \cdot 10 \text{H}_2\text{O}$  (c). The vapor pressure data of Tammann and Krige<sup>1</sup> for the system,  $\text{Br}_2 \cdot 10 \text{H}_2\text{O}$  (c)  $-\text{H}_2\text{O}$  (c), yield  $Q = -7.9^{10}$  for the reaction  $\text{Br}_2 \cdot 10 \text{H}_2\text{O}$  (c)  $= \text{Br}_2$  (g)  $+ 10 \text{H}_2\text{O}$  (c). This is in agreement with the data of Roozeboom.<sup>3, 4</sup>

**HBr (aq.).** Thomsen<sup>15</sup> measured the heat of the following reactions:  $\frac{1}{2} \text{Cl}_2$  (g)  $+ \text{KBr}$  (200)  $= (\text{KCl} + \frac{1}{2} \text{Br}_2)$  (200);  $\frac{1}{2} \text{Br}_2$  (liq.)  $= \frac{1}{2} \text{Br}_2$  (aq.). We have recomputed Thomsen's data on these reactions, obtaining for,  $\frac{1}{2} \text{Cl}_2$  (g)  $+ \text{KBr}$  (200)  $= \text{KCl}$  (200)  $+ \frac{1}{2} \text{Br}_2$  (liq.),  $Q = 10.94$ , which is equivalent to the heat of formation of  $\text{KCl}$  (200) minus the heat of formation of  $\text{KBr}$  (200). By combining with this last equation the difference in the heats of neutralization of aqueous  $\text{HCl}$  and  $\text{HBr}$  with aqueous  $\text{KOH}$ , which is  $\text{HCl}$  (100)  $+ \text{KBr}$  (200)  $= \text{HBr}$  (100)  $+ \text{KCl}$  (200),  $Q = 0.024$ , we have obtained, for  $\frac{1}{2} \text{Cl}_2$  (g)  $+ \text{HBr}$  (100)  $= \frac{1}{2} \text{Br}_2$  (liq.)  $\text{HCl}$  (100),  $Q = 10.916$ . From which we have computed, for  $\text{HBr}$  (100),  $Q_f = 28.47$ . Berthelot<sup>151</sup> measured the heat of the reaction between  $\frac{1}{2} \text{Br}_2$  (liq.) and  $\text{KI}$  (aq.), which for several reasons is preferable to the reaction studied by Thomsen<sup>15</sup>; but there is apparently some considerable error in Berthelot's data on this reaction. Berthelot<sup>45</sup> also measured the heats of the reactions,  $\text{Br}_2$  (liq.)  $+ \text{SO}_2$  (aq.) and  $\text{I}_2$  (c)  $+ \text{SO}_2$  (aq.), the difference between which gives the heat of the reaction  $\frac{1}{2} \text{Br}_2$  (liq.)  $+ \text{HI}$  (aq.)  $= \frac{1}{2} \text{I}_2$  (c)  $+ \text{HBr}$  (aq.); but his data on these reactions are lacking in accuracy.

Thomsen measured the heats of the reactions,  $\text{KCl}$  (200)  $+ \text{AgNO}_3$  (400)  $= \text{AgCl}$  (c)  $+ \text{KNO}_3$  (600) and  $\text{KBr}$  (200)  $+ \text{AgNO}_3$  (400)  $= \text{AgBr}$  (c)  $+ \text{KNO}_3$  (600), the difference of which gives  $\text{KCl}$  (200)  $+ \text{AgBr}$  (c)  $= \text{KBr}$  (200)  $+ \text{AgCl}$  (c). Combining with this equation, the difference in the heats of formation of  $\text{AgCl}$  (c) and  $\text{AgBr}$  (c), the difference in the heats of neutralization of  $\text{HCl}$  (100) and  $\text{HBr}$  (100) with  $\text{KOH}$  (100), and the heat of formation of  $\text{HCl}$  (100), we have obtained, for  $\text{HBr}$  (100),  $Q_f = 28.63$ . Utilizing, in a similar manner, the difference in the heats of reaction of  $\text{KI}$  (200) and of  $\text{KBr}$  (200) with  $\text{AgNO}_3$  (200) as measured by Thomsen,<sup>15</sup> the difference in the heats of formation of  $\text{AgI}$  (c) and  $\text{AgBr}$  (c), the difference in the heats of neutralization of  $\text{HI}$  (100) and  $\text{HBr}$  (100) with  $\text{KOH}$  (100), and the heat of formation of  $\text{HI}$  (100), we have computed, for  $\text{HBr}$  (100),  $Q_f = 28.44$ .

The heat of diluting aqueous  $\text{HBr}$  from 100 to  $\infty \text{H}_2\text{O}$  has been computed from the following reactions whose heats are known:  $\text{NaOH}(\infty) + \text{HBr}(\infty) = \text{NaBr}(\infty) + \text{H}_2\text{O}(\text{liq.})$ ;  $\text{NaOH}(100) + \text{HBr}(100) = \text{NaBr}(201) + \text{H}_2\text{O}(\text{liq.})$ ;  $\text{NaOH}(100) = \text{NaOH}(\infty)$ ; and  $\text{NaBr}(201) = \text{NaBr}(\infty)$ . The values for the heat of dilution in the more concentrated solutions to 1  $\text{H}_2\text{O}$  are taken from the data of Berthelot,<sup>18</sup> Roozeboom,<sup>8</sup> and Thomsen.<sup>15</sup>

**$\text{HBr}$  (g).** For the heat of solution of gaseous  $\text{HBr}$  in water, the data of Thomsen yield  $S = 19.89_{400}$ ; Berthelot found  $S = 20.0_{760}$ .<sup>15</sup>

**$\text{HBr}$  (liq.).** The heat of vaporization of liquid  $\text{HBr}$  was measured by Elliott and McIntosh,<sup>1</sup> Estreicher and Schnee,<sup>1</sup> Eucken and Karwat,<sup>1</sup>

and Giauque and Wiebe.<sup>2</sup> Vapor pressure data were reported by Maass and McIntosh,<sup>1</sup> Steele and Bagster,<sup>1</sup> Steel, McIntosh, and Archibald,<sup>1</sup> Eucken and Karwat,<sup>1</sup> and Giauque and Wiebe.<sup>2</sup> All these data are in accord, and we have selected the directly measured value of Giauque and Wiebe.<sup>2</sup>

**HBr (c, I), HBr (c, II), HBr (c, III).** The heat of fusion of HBr (c, I) and the heats of the two transitions of crystalline HBr were measured by Eucken and Karwat,<sup>1</sup> and by Giauque and Wiebe,<sup>2</sup> whose values we have selected. The vapor pressure of solid hydrogen bromide was measured by Henglein,<sup>3</sup> Maass and McIntosh,<sup>1</sup> Steele, McIntosh, and Archibald,<sup>1</sup> and Drozdowski and Pietrzak.<sup>1</sup>

**HBr · H<sub>2</sub>O (c).** Roozeboom<sup>6</sup> reported  $-3.0$  for the heat of fusion.

**HBr · 2 H<sub>2</sub>O (c).** Berthelot<sup>18</sup> reported  $16.9$  for the heat of the reaction  $\text{HBr (g)} + 2 \text{H}_2\text{O (liq.)} = \text{HBr} \cdot 2 \text{H}_2\text{O (c)}$ , but no details of the experiments were reported. The vapor pressure data of Roozeboom<sup>6</sup> are in accord with Berthelot's value.

**Br<sub>3</sub><sup>-</sup> (aq.).** Berthelot<sup>105B, 151</sup> measured the heat of solution of liquid bromine in aqueous KBr and in aqueous HBr at  $12^\circ$ , finding, respectively,  $2.7$  and  $2.0$ . Correcting these data to  $18^\circ$ , we have obtained for the reaction,  $\text{Br}_2 \text{ (liq.)} + \text{Br}^- \text{ (aq.)} = \text{Br}_3^- \text{ (aq.)}$ ,  $Q = 2.7 \pm 0.4$ ; whence, for  $\text{Br}_3^- \text{ (aq.)}$ ,  $Qf = 31.3$ . Linhart<sup>1</sup> determined at various temperatures the equilibrium constant for the reaction,  $\text{Br}_2 \text{ (aq.)} + \text{Br}^- \text{ (aq.)} = \text{Br}_3^- \text{ (aq.)}$ , and calculated  $Q = 1.30$ ; whence, for  $\text{Br}_3^- \text{ (aq.)}$ ,  $Qf = 31.1$ .

**Br<sub>5</sub><sup>-</sup> (aq.).** Linhart<sup>1</sup> explained the activity of bromine dissolved in concentrated aqueous KBr as due to the existence of  $\text{Br}_5^- \text{ (aq.)}$ . This explanation also accounts for the thermal behavior of these solutions. Linhart's data on the temperature coefficient of the equilibrium constant yield, for  $\text{Br}_5^- \text{ (aq.)}$ ,  $Qf = 35.7$ . Berthelot's<sup>151, 105B</sup> calorimetric data lead to practically the same value.

**BrO<sup>-</sup> (aq.).** From the values for the heats of formation of  $\text{NaBrO}$  (aq.),  $\text{KBrO}$  (aq.),  $\text{Na}^+ (\infty)$ , and  $\text{K}^+ (\infty)$ , we have calculated, for  $\text{BrO}^- \text{ (aq.)}$ ,  $Qf = 21.2$  and  $21.4$ , respectively.

**HBrO (aq.).** There are no data on the heat of neutralization of  $\text{HBrO}$  (aq.). Assuming that the heat of the reaction  $\text{HBrO (aq.)} = \text{H}^+ \text{ (aq.)} + \text{BrO}^- \text{ (aq.)}$  is the same as that for  $\text{HClO (aq.)} = \text{H}^+ \text{ (aq.)} + \text{ClO}^- \text{ (aq.)}$ , we have computed, for  $\text{HBrO}$  (aq.),  $Qf = 25.2$ .

**HBrO<sub>3</sub> (aq.).** Thomsen<sup>12, 15</sup> measured the heat of the reaction,  $\text{HBrO}_3 \text{ (1250)} + 3 \text{ (SnCl}_2 + 2 \text{HCl) (500)} = \text{HBr} + 3 \text{SnCl}_4 \text{ (2750)} + 3 \text{H}_2\text{O (liq.)}$ , and found  $Q = 213.2$ ; whence we have computed, for  $\text{HBrO}_3 \text{ (1250)}$ ,  $Qf = 11.30$ .

**BrO<sub>3</sub><sup>-</sup> (aq.).** From the values of  $Qf$  for  $\text{KBrO}_3 (\infty)$  and  $\text{K}^+ (\infty)$ , we have obtained, for  $\text{BrO}_3^- (\infty)$ ,  $Qf = 11.21$ .

**BrCl (g).** From spectroscopic data, Jost<sup>3</sup> deduced values of the equilibrium constant at various temperatures, and computed for  $\frac{1}{2} \text{Br}_2 \text{ (g)} + \frac{1}{2} \text{Cl}_2 \text{ (g)} = \text{BrCl (g)}$ ,  $Q = 0.75$ .

## IODINE

**I<sub>2</sub> (c).** Standard state.

**I<sub>2</sub> (g).** Vapor pressure data on solid iodine were reported by Baxter and Grose,<sup>1</sup> Baxter, Hickey, and Holmes,<sup>1</sup> and Ramsay and Young.<sup>1</sup> Haber and Kerschbaum<sup>1</sup> measured the vapor pressure at low temperatures. Giauque<sup>2</sup> critically reviewed the data, and deduced for the heat of sublimation,  $V_s = -16.069 + 0.0040 (t + 273.1)$ , which gives at 18°, -14.91. Earlier calculations were made by Wohl,<sup>3</sup> Dewar,<sup>1</sup> and Nernst.<sup>1</sup>

**I<sub>2</sub> (liq.).** Vapor pressure data for liquid iodine were reported by Ramsay and Young,<sup>1</sup> Stelzner and Niederschulte,<sup>1</sup> and Rassow.<sup>1</sup> These data yield for the heat of vaporization,  $V = -12.75 + 0.0056 (t + 273.1)$ . Combination of this equation with that for the heat of sublimation gives for the heat of fusion of solid iodine,  $F = -3.3 + 0.0016 (t + 273.1)$ , or -4.0 at the melting point. See also Rideal.<sup>1</sup>

**I<sub>2</sub> (aq.).** From measurements of the temperature coefficient of solubility, Hartley and Campbell<sup>1</sup> computed  $S = -5.0$ . Sammet's<sup>1</sup> data yield  $S = -4.9$ , his own calculated value of -6.37 evidently being in error.

**I<sub>2</sub> (C<sub>2</sub>H<sub>5</sub>OH).** Pickering<sup>8</sup> and Waentig<sup>1</sup> reported for the heat of solution of solid iodine in ethyl alcohol -1.7 and -1.9, respectively. The solution is brown.

**I<sub>2</sub> (C<sub>2</sub>H<sub>5</sub>OC<sub>2</sub>H<sub>5</sub>).** Pickering<sup>8</sup> and Waentig<sup>1</sup> reported for the heat of solution of solid iodine in ether -1.6 and -2.0, respectively. The solution is brown.

**I<sub>2</sub> (CS<sub>2</sub>).** Pickering<sup>8</sup> and Waentig<sup>1</sup> measured the heat of solution of solid iodine in carbon disulfide to be -5.0 and -5.2, respectively. The solution is purple.

**I<sub>2</sub> (CHCl<sub>3</sub>).** Pickering<sup>8</sup> and Waentig<sup>1</sup> found  $S = -6.0$  and -5.5, respectively, for the heat of solution of solid iodine in chloroform. The solution is purple.

**I<sub>2</sub> (C<sub>6</sub>H<sub>6</sub>).** Pickering<sup>8</sup> and Waentig<sup>1</sup> reported, for I<sub>2</sub> (c) in benzene,  $S = -6.0$  and -4.7, respectively. The solution is purple.

**I<sub>2</sub> (CCl<sub>4</sub>).** Pickering,<sup>8</sup> for I<sub>2</sub> (c) in carbon tetrachloride, found  $S = -5.3$ . The solution is purple.

**I<sub>2</sub> (pyridine).** Waentig<sup>1</sup> found  $S = 17$  for the heat of solution of solid iodine in pyridine.

**I (g).** Density measurements on iodine vapor at high temperatures, which yield values of the equilibrium constant for the reaction, I<sub>2</sub> (g) = 2 I (g), were made by DeVries and Rodebush,<sup>1</sup> Weide and Bichowsky,<sup>1</sup> Braune and Ramstetter,<sup>1</sup> Starck and Bodenstein,<sup>1</sup> Bjerrum,<sup>3</sup> and Deville and Troost.<sup>2</sup> The computed heats of dissociation at 18° from the first five named investigations are, respectively, -31.6, -32, -33.6, -35.4, and -35.7. Lewis and Randall<sup>5</sup> calculated, from Starck and Bodenstein's<sup>1</sup> data,  $D^{\circ} = -31.7$ . Spectroscopic determinations of the energy of dissociation of the normal gaseous I<sub>2</sub> molecule to form 2 normal I atoms lead to much more accurate values than the foregoing ones. Kuhn,<sup>1</sup> Koenigsberger,<sup>1</sup> Gibson and Heitler,<sup>1</sup> and Brown<sup>4</sup> reported values from

spectroscopic data, the last named investigation giving  $D^\circ = -35.40 \pm 0.03$ . See also Senfleben and Germer<sup>1</sup> and Kondratjeiv and Leipunsky.<sup>1</sup>

The values for the energy states of gaseous monatomic iodine are from Evans<sup>1</sup> and Bacher and Goudsmit.<sup>1</sup>

**I<sup>-</sup> (g).** Utilizing the data on the lattice energies of CsI and KI, we have computed for the reaction,  $\frac{1}{2}\text{I}_2(\text{c}) + \theta = \text{I}^-(\text{g})$ ,  $Q = 58.4$  and  $52.4$ , respectively. Sherman<sup>1</sup> calculated for the same reaction, from the data on the alkali iodides, the values 56.4, 52.7, 51.1, 52.3, and 56.3. See also Lennard-Jones.<sup>2</sup> Recently Mayer<sup>3</sup> measured the electrical conductivity of gaseous cesium iodide and of potassium iodide, and deduced values of the equilibrium constant at various temperatures for the reaction  $\text{MI}(\text{g}) = \text{M}^+(\text{g}) + \text{I}^-(\text{g})$ . For CsI (g) and KI (g), he calculated, respectively,  $D^\circ = 94.8 \pm 0.5$  and  $-104.6 \pm 0.5$ . Utilizing our values for CsI (g), Cs<sup>+</sup> (g), KI (g), and I<sup>-</sup> (g), one obtains  $Q_f = 55.1$  and  $52.3$  respectively. From a study of the absorption spectra of some alkali iodides, Lederle<sup>1</sup> deduced the unaccountably low values of 48.2, 47.4, and 46.5.

**HI (aq.).** Thomsen<sup>15</sup> measured the heat of the reaction  $\frac{1}{2}\text{Cl}_2(\text{g}) + \text{KI}(200) = \text{KCl}(200) + \frac{1}{2}\text{I}_2(\text{c})$ . We have recomputed the data of his three experiments, and have obtained, for the above reaction,  $Q = 26.26$ . Subtracting from the above equation, the difference in the heats of neutralization of HCl (100) and HI (100) with KOH (100),  $\text{HCl}(100) + \text{KI}(200) = \text{KCl}(200) + \text{HI}(100)$ ,  $Q = 0.110$ , we have obtained for the reaction,  $\frac{1}{2}\text{Cl}_2(\text{g}) + \text{HI}(100) = \text{HCl}(100) + \frac{1}{2}\text{I}_2(\text{c})$ ,  $Q = 26.15$ ; whence, for HI (100),  $Q_f = 13.23$ . Thomsen<sup>15</sup> also measured the heats of the reactions,  $\text{KCl}(200) + \text{AgNO}_3(400) = \text{AgCl}(\text{c}) + \text{KNO}_3(600)$  and  $\text{KI}(200) + \text{AgNO}_3(400) = \text{AgI}(\text{c}) + \text{KNO}_3(600)$ . From his data on these reactions, we have calculated, for  $\text{KCl}(200) + \text{AgI}(\text{c}) = \text{KI}(200) + \text{AgCl}(\text{c})$ ,  $Q = -10.57$ . Combining this equation with that for the difference in the heats of neutralization of HCl (100) and HI (100) with KOH (100), we have obtained, for the reaction,  $\text{HCl}(100) + \text{AgI}(\text{c}) = \text{HI}(100) + \text{AgCl}(\text{c})$ ,  $Q = -10.46$ . And using our values for HCl (100), AgI (c), and AgCl (c), one finds, for HI (100),  $Q_f = 13.56$ .

A value for the heat of formation of aqueous HI can also be deduced from the following reactions, whose heats were measured by Thomsen<sup>15</sup>:  $\text{KCl}(200) + \text{HgNO}_3(200) = \frac{1}{2}\text{Hg}_2\text{Cl}_2(\text{c}) + \text{KNO}_3(400)$  and  $\text{KI}(200) + \text{HgNO}_3(200) = \frac{1}{2}\text{Hg}_2\text{I}_2(\text{c}) + \text{KNO}_3(400)$ . The difference gives, for  $\text{KCl}(200) + \frac{1}{2}\text{Hg}_2\text{I}_2(\text{c}) = \text{KI}(200) + \frac{1}{2}\text{Hg}_2\text{Cl}_2(\text{c})$ ,  $Q = -9.10$ . Combining this with the difference in the heats of neutralization of HCl (100) and HI (100) with KOH (100) gives, for  $\text{HCl}(100) + \frac{1}{2}\text{Hg}_2\text{I}_2(\text{c}) = \frac{1}{2}\text{Hg}_2\text{Cl}_2(\text{c}) + \text{HI}(100)$ ,  $Q = -8.99$ . Using our values for the other three substances in this equation, we have obtained, for HI (100),  $Q_f = 13.25$ . Utilizing in a similar manner, Thomsen's<sup>15</sup> data on the reaction of  $\text{Pb}(\text{NO}_3)_2(\text{aq.})$  with KCl (aq.) and KI (aq.), respectively, we have computed, for HI (100),  $Q_f = 13.21$ .

**HI (g).** The heat of solution of gaseous hydrogen iodide in water was measured by Favre and Silbermann,<sup>3</sup> Berthelot and Louguinine,<sup>1</sup> and

Thomsen.<sup>15</sup> Only the data of Thomsen<sup>15</sup> are accurately specified as to temperature and concentration, and we have recomputed them to obtain  $S_{200}=19.19$ . This gives, for HI (g),  $Qf=-5.91$ . The data of Stegmüller,<sup>1</sup> who measured the temperature coefficient of the cell in which the reaction was  $\frac{1}{2} \text{H}_2 \text{ (g)} + \frac{1}{2} \text{I}_2 \text{ (g)} = \text{HI (g)}$ , yield  $Q=1.70$ ; whence, for HI (g),  $Qf=-5.76$ . Haber<sup>1</sup> reported for the foregoing reaction  $Q=0.096$ , calculated from the equilibrium measurements of Bodenstein<sup>1</sup> at high temperatures; but Lewis and Randall<sup>5</sup> pointed out that neglect of the dissociation of  $\text{I}_2$  introduced a false trend in the values of the equilibrium constant. Recently, Gunther and Wekua<sup>1</sup> measured the heat of the reaction,  $\frac{1}{2} \text{Cl}_2 \text{ (g)} + \text{HI (g)} = \text{HCl (g)} + \frac{1}{2} \text{I}_2 \text{ (c)}$ , to be  $Q=27.97$ , whence, for HI (g),  $Qf=-5.91$ .

HI (liq.). Cottrell<sup>1</sup> found for the heat of solution of liquid HI in water  $14.78_{700}^{12}$ ; whence, for HI (liq.),  $Qf=-1.39$  and  $V=-4.42$ . The data on the heat of vaporization of liquid HI at the boiling point are: Giauque and Wiebe,<sup>3</sup>  $-4.72$ ; Estreicher and Schneer,<sup>1</sup>  $-4.33$ ; Elliott and McIntosh,<sup>1</sup>  $-4.50$ ; and Eucken and Karwat,<sup>1</sup>  $-4.94$ .

HI (c, I), HI (c, II), HI (c, III). The heat of fusion of HI (c, I) and the heat of the two transitions were measured by Giauque and Wiebe<sup>3</sup> and Eucken and Karwat.<sup>1</sup> We have selected the values of the former.

$\text{I}_3^- \text{ (aq.)}$ . Jones and Kaplan<sup>1</sup> determined the equilibrium constant for the reaction,  $\text{I}_3^- \text{ (aq.)} = \text{I}_2 \text{ (aq.)} + \text{I}^- \text{ (aq.)}$ , at  $0^\circ$  and  $25^\circ$ , finding  $K=0.00072$  and  $0.00140$ , respectively. From the temperature coefficient of the equilibrium constant, we have computed, for the above reaction,  $Q=-4.22$ , whence, for  $\text{I}_3^- \text{ (aq.)}$ ,  $Qf=12.6$ . Pickering<sup>8</sup> measured the heat of solution of  $\text{I}_2 \text{ (c)}$  in 7.6 KI (408), finding  $Q=-1.1$ . For this concentration, we have calculated from the value of the equilibrium constant that 0.1 of the iodine remains as  $\text{I}_2 \text{ (aq.)}$ . That is, for the reaction,  $\text{I}_2 \text{ (c)} + 0.9 \text{I}^- \text{ (aq.)} = 0.1 \text{I}_2 \text{ (aq.)} + 0.9 \text{I}_3^- \text{ (aq.)}$ ,  $Q=-1.1$ . From this we have computed, for  $\text{I}_3^- \text{ (aq.)}$ ,  $Qf=12.5$ .

HIO (aq.). Skrabal<sup>1</sup> estimated the following:  $\text{I}_2 \text{ (aq.)} + \text{OH}^- \text{ (aq.)} = \text{HIO (aq.)} + \text{I}^- \text{ (aq.)}$ ,  $Q=1.0$ , and  $\text{OH}^- \text{ (aq.)} + \text{I}_3^- \text{ (aq.)} = \text{HIO (aq.)} + 2 \text{I}^- \text{ (aq.)}$ ,  $Q=-5.9$ . From these data we have computed, for HIO (aq.),  $Qf=37.3$  and  $34.6$ , respectively. From the temperature coefficient of the equilibrium constant, Angeleser and Popeser<sup>1</sup> calculated for the reaction,  $\text{I}_2 \text{ (aq.)} + \text{H}_2\text{O (liq.)} = \text{HIO (aq.)} + \text{HI (aq.)}$ ,  $Q=-11.7$ ; whence, for HIO (aq.),  $Qf=38.3$ . See also Berthelot.<sup>46</sup>

$\text{IO}^- \text{ (aq.)}$ . This value is computed from that for HIO (aq.), assuming the heat of ionization to be the same as that for HClO (aq.).

$\text{HIO}_3 \text{ (aq.)}$ . We have recomputed the data of Thomsen on the reactions,  $\text{KI (600)} + 3 \text{HClO (200)} = (\text{HIO}_3 + 2 \text{HCl} + \text{KCl}) \text{ (1200)}$  and  $(5 \text{HCl} + 5 \text{KI}) \text{ (1000)} + \text{HIO}_3 \text{ (aq.)} = 3 \text{I}_2 \text{ (aq.)} + 3 \text{H}_2\text{O (liq.)} + 5 \text{KCl (1000)}$ , and have obtained, for  $\text{HIO}_3 \text{ (aq.)}$ ,  $Qf=54.61$  and  $54.71$ , respectively. Berthelot<sup>42,45</sup> and Skrabal and Buchta<sup>1</sup> also measured the heat of the latter reaction, and their data yield  $Qf=54.8$  and  $55.8$ , respectively. The data of Luther and Sammet,<sup>1</sup> who determined the temperature coefficient

of the equilibrium constant for the reaction,  $6 \text{H}^+ (\text{aq.}) + \text{IO}_3^- (\text{aq.}) + 5 \text{I}^- (\text{aq.}) = 3 \text{I}_2 (\text{aq.}) + 3 \text{H}_2\text{O} (\text{liq.})$ , yield, for  $\text{HIO}_3 (\text{aq.})$ ,  $Qf = 55.4$ . The data of Thomsen<sup>15</sup> on the reaction,  $(6 \text{HCl} + 3 \text{SnCl}_2) (\text{aq.}) + \text{HIO}_3 (\text{aq.}) = 3 (\text{SnCl}_4 + \text{HI}) (\text{aq.}) + 3 \text{H}_2\text{O} (\text{liq.})$ , yield, for  $\text{HIO}_3 (\text{aq.})$ ,  $Qf = 53.8$ . Berthelot<sup>45</sup> and Skrabal and Buchta<sup>1</sup> measured the heat corresponding to the reaction,  $3 \text{I}_2 (\text{c}) + 6 \text{OH}^- (\text{aq.}) = \text{IO}_3^- (\text{aq.}) + 5 \text{I}^- (\text{aq.}) + 3 \text{H}_2\text{O} (\text{liq.})$ , and their data yield, for  $\text{HIO}_3 (\text{aq.})$ ,  $Qf = 54.2$ .

$\text{IO}_3^- (\text{aq.})$ . We have computed the value of  $Qf$  for  $\text{IO}_3^- (\infty)$  from the values for  $\text{KIO}_3 (\infty)$  and  $\text{K}^+ (\infty)$ .

$\text{I}_2\text{O}_5 (\text{c.})$ . The data on the heat of solution of solid iodine pentoxide yield the following values: Ditte,<sup>4</sup>  $-1.90$ ; Berthelot,<sup>46</sup>  $-1.62^{12}$ ; Thomsen,<sup>15</sup>  $-1.90$ . From Thomsen's data, and the reaction,  $\text{I}_2\text{O}_5 (\text{c.}) + \text{H}_2\text{O} (\text{liq.}) = 2 \text{HIO}_3 (\text{aq.})$ , we have computed, for  $\text{I}_2\text{O}_5 (\text{c.})$ ,  $Qf = 42.73$ .

$\text{HIO}_3 (\text{c.})$ . The data on the heat of solution of  $\text{HIO}_3 (\text{c.})$  in water yield the following values: Ditte,<sup>4</sup>  $-2.24$ ; Berthelot,<sup>46</sup>  $-2.67^{12}$ ; Thomsen,<sup>15</sup>  $-2.17$ . Using Thomsen's value we have obtained, for  $\text{HIO}_3 (\text{c.})$ ,  $Qf = 56.77$ .

$\text{I}_2\text{O}_5 \cdot \text{HIO}_3 (\text{c.})$ . Berthelot<sup>46</sup> reported for  $\text{I}_2\text{O}_5 \cdot \text{HIO}_3 (\text{c.})$ ,  $S = -4.29^{12}$ , and for  $\text{I}_2\text{O}_5 \cdot 2 \text{HIO}_3 (\text{c.})$ ,  $S = -5.72^{12}$ . Our best present information is that only the former hydrate of  $\text{I}_2\text{O}_5$  exists. Berthelot's  $\text{I}_2\text{O}_5 \cdot 2 \text{HIO}_3 (\text{c.})$  was probably a mixture.

$\text{H}_5\text{IO}_6 (\text{aq.})$ . Thomsen<sup>15</sup> measured the heat of reduction of  $\text{H}_5\text{IO}_6 (\text{aq.})$  with aqueous stannous chloride acidified with  $\text{HCl}$ , and his data yield, for  $\text{H}_5\text{IO}_6 (\text{aq.})$ ,  $Qf = 183.0$ .

$\text{H}_5\text{IO}_6 (\text{c.})$ . Thomsen<sup>15</sup> found  $S = -1.38_{2000}$ .

$\text{H}_4\text{IO}_6^- (\text{aq.})$ ,  $\text{H}_3\text{IO}_6^{2-} (\text{aq.})$ ,  $\text{H}_2\text{IO}_6^{3-} (\text{aq.})$ ,  $\text{HIO}_6^{4-} (\text{aq.})$ ,  $\text{IO}_6^{5-} (\text{aq.})$ . Thomsen<sup>15</sup> measured the heat of neutralizing  $\text{H}_5\text{IO}_6 (\text{aq.})$  with 1, 2, 3, and 5 moles of  $\text{KOH} (\text{aq.})$ . The data are extraordinary in that Thomsen found a much smaller heat for the first mole of  $\text{KOH}$  than for the second, which is quite contrary to the usual behavior. It is difficult to tell which ions really exist in the solution and the values for the foregoing ions are computed in a purely formal manner.

$\text{ICl} (\text{g.})$ . McMorris and Yost<sup>1</sup> studied the equilibrium,  $\frac{1}{2} \text{Cl}_2 (\text{g.}) + \frac{1}{2} \text{I}_2 (\text{g.}) = \text{ICl} (\text{g.})$ , at various temperatures, and deduced, for  $\text{ICl} (\text{g.})$ ,  $Qf = -3.13$ . The energy of dissociation of  $\text{ICl} (\text{g.})$  into normal iodine and chlorine atoms has been determined from spectroscopic data by Wilson,<sup>3</sup> Gibson and Ramsperger,<sup>1</sup> Patkowski and Curtis,<sup>1</sup> and Brown and Gibson.<sup>1</sup> The data of Brown and Gibson<sup>1</sup> are the most accurate and give, for  $\text{ICl} (\text{g.})$ ,  $Qf = -3.46$ .

$\text{ICl} (\text{liq.})$ . McMorris and Yost,<sup>1</sup> from vapor pressure data on liquid  $\text{ICl}$ , computed  $V = -9.49$ ; whence, for  $\text{ICl} (\text{liq.})$ ,  $Qf = 6.03$ . Thomsen<sup>15</sup> measured the heat of formation of  $\text{ICl} (\text{liq.})$  and found  $Qf = 5.85$ .

$\text{ICl} (\text{c, } \alpha)$ . Berthelot<sup>64, 140</sup> measured directly the heat of formation of  $\text{ICl} (\text{c, } \alpha)$ , finding  $Qf = 6.9$ ; and also measured its heat of solution in aqueous sulfurous acid, which latter data lead to the value 6.6. The

data on the heat of fusion of  $\text{ICl}$  (c,  $\alpha$ ) are: Tanatar,<sup>5</sup>  $-2.32$ ; Stortebeker,<sup>1</sup>  $-2.66$ ; Berthelot,<sup>64, 140</sup>  $-2.43$ . These values, coupled with that for  $\text{ICl}$  (liq.),  $Qf=6.03$ , yield, for  $\text{ICl}$  (c,  $\alpha$ ),  $Qf=8.35$ ,  $8.69$ , and  $8.46$ , respectively.

$\text{ICl}_3$  (c). For  $\text{ICl}_3$  (c), Thomsen<sup>15</sup> reported  $Qf=21.5$ ; Berthelot<sup>64</sup> found, by direct combination,  $Qf=15.5$ , and by the reaction with aqueous sulfurous acid,  $Qf=17.1$ .

$\text{IBr}$  (g). From the data of Bodenstein and Schmidt<sup>1</sup> and Muller<sup>13</sup> on the equilibrium,  $\frac{1}{2} \text{Br}_2$  (g) +  $\frac{1}{2} \text{I}_2$  (g) =  $\text{IBr}$  (g), we have computed, for  $\text{IBr}$  (g),  $Qf=-9.6$ . The spectroscopic data of Cordes and Sponer<sup>1</sup> on the energy of dissociation of  $\text{IBr}$  (g) into normal iodine and bromine atoms yield, for  $\text{IBr}$  (g),  $Qf=-10.3$ .

$\text{IBr}$  (liq.). By direct measurement, Berthelot<sup>64, 140</sup> found  $Qf=2.47$ .

$\text{BrCl}$  (g). We have estimated this value.

$\text{BrCl}$  (liq.). We have estimated this value.

## ELEMENT 85

X (c). Standard state.

## SULFUR

S (c, rhombic). Standard State.

S (c, monoclinic). The heat of transformation of monoclinic to rhombic sulfur was measured by Bronsted,<sup>3</sup> Mitscherlich,<sup>2</sup> Tammann,<sup>2, 3</sup> Lewis and Randall,<sup>1</sup> Wigand,<sup>1</sup> and Mondain-Monval.<sup>1, 4</sup> Using Lewis and Randall's<sup>5</sup> values for the heat capacities, we have found that Bronsted's<sup>3</sup> data yield, for the transformation,  $T=0.120-0.0005(t+273.1)-0.00000125(t+273.1)^2$ ; whence, at  $18^\circ$ ,  $T=-0.080$ , and at  $95^\circ$ , the normal transition temperature,  $T=-0.088$ . Mondain-Monval<sup>1, 4</sup> found  $T=-0.087$ .

S (liq.,  $\mu$ ), S (liq.,  $\lambda$ ). Liquid sulfur is a mixture of at least two forms, soluble S ( $\lambda$ ) and insoluble S ( $\mu$ ). At the melting point there is 95 per cent of the former. Lewis and Randall<sup>1</sup> found, for the heat of fusion of rhombic sulfur,  $F=-0.478^{112}$ . For the heat of fusion of monoclinic sulfur, the following data were reported: Mondain-Monval,<sup>4</sup>  $-0.297^{119}$ ; Person,<sup>1</sup>  $-0.30^{115}$ ; Trautz,<sup>6</sup>  $-0.284^{119}$ ; Iitaka,<sup>1</sup>  $-0.429^{119}$ ; Wigand,<sup>1</sup>  $-0.334^{119}$ . At  $119^\circ$  liquid sulfur contains 4 per cent of S ( $\mu$ ). Taking Wigand's<sup>1</sup> value, we have computed, for S (c, monoclinic) = S (liq.,  $\lambda$ ),  $F=-0.35^{119}$ ; and utilizing the heat capacity data of Lewis and Randall,<sup>1</sup> we have calculated, for S (liq.,  $\lambda$ ),  $Qf=-0.33$ .

For the heat of transformation, S (liq.,  $\lambda$ ) = S (liq.,  $\mu$ ). Lewis and Randall<sup>1</sup> reported  $-0.416^{25}$ ; Mondain-Monval,<sup>4</sup>  $-0.9^{160}$ ; Berthelot,<sup>1</sup>  $-0.86^{185}$ . Taking Lewis and Randall's value, we have computed, for S (liq.,  $\mu$ ),  $Qf=-0.75$ .

$\text{S}_8$  ( $\text{CS}_2$ ). Berthelot<sup>1, 130</sup> measured the heat of solution of sulfur in carbon disulfide.

S ( $\text{S}_2\text{Cl}_2$ ). The heat of solution of sulfur in liquid  $\text{S}_2\text{Cl}_2$  was found

by Trautz<sup>6</sup> to be  $-1.3$  to  $-3.0$ , and by Thomsen,<sup>15</sup>  $-0.83$ ; the data on the variation of solubility with temperature yield  $-1.5$ .

$S_8(g)$ ,  $S_6(g)$ ,  $S_2(g)$ . Sulfur gas is a mixture of  $S_8$  and its dissociation products. The gas in equilibrium with the liquid at  $150^\circ$  is practically all  $S_8$ . Vapor pressure data on liquid sulfur were reported by Ruff and Graf,<sup>1</sup> Bodenstein,<sup>4</sup> Gruener,<sup>1</sup> and Mathies<sup>1</sup>; and these data were used by Preuner and Schupp<sup>1</sup> to compute  $V = -20.0^{150}$ . The vapor pressure data of West and Menzies<sup>1</sup> yield  $V = -20.5^{150}$ . Awbery<sup>1</sup> measured directly the heat of vaporization at the boiling point to be  $-20.2$ .

The isotherms of sulfur vapor indicate the existence of at least two molecular species in addition to  $S_8$ . Arbitrarily selecting the species as  $S_8$ ,  $S_6$ , and  $S_2$ , we have interpreted the data of Mitscherlich<sup>1</sup> and Preuner and Schupp<sup>1</sup> to give the following values:  $3 S_8(g) = 4 S_6(g)$ ,  $Q = -29$ ;  $S_6(g) = 3 S_2(g)$ ,  $Q = -64$ .

Data on the vapor pressure of sulfur above the boiling point were reported by Barus,<sup>1, 2</sup> Greuner,<sup>1</sup> Rassow,<sup>1</sup> Regnault,<sup>6, 7</sup> Ruff and Graf,<sup>1</sup> and Menzies.<sup>1</sup>

There is an indirect but more certain method of calculating the heat of formation of  $S_2(g)$  than the foregoing. Lewis and Randall<sup>3, 5</sup> reviewed the equilibrium data of Preuner,<sup>1</sup> Preuner and Schupp,<sup>1</sup> and Randall and Bichowsky<sup>1</sup> on the reaction,  $H_2(g) + \frac{1}{2} S_2(g) = H_2S(g)$ , and concluded that  $Q = -19.6$ . Using our value of  $Q_f$  for  $H_2S(g)$ , we have obtained, for  $S_2(g)$ ,  $Q_f = -28.6$ . Lewis and Randall<sup>5</sup> also reviewed the equilibrium data leading to the reaction,  $S(c, \text{rhombic}) + H_2(g) = H_2S(g)$ , and calculated, for  $S_2(g)$ ,  $Q_f = -29.7$ .

The energy states of the gaseous  $S_2$  molecule are evaluated from the band spectral data of Christy and Naude.<sup>1</sup> The spectrum of  $S_2$  has also been studied by Henri,<sup>3</sup> Henri and Teves,<sup>1</sup> Rosen,<sup>1</sup> and Kondratjew.<sup>1</sup> See also Jevons.<sup>1</sup>

$S(g)$ . From data on a bomb reaction involving the combustion of hydrogen sulfide, Budde<sup>1</sup> deduced for the reaction,  $S_2(g) = 2 S(g)$ ,  $Q = -120.2^{450}$ . However, Bjerrum<sup>3</sup> pointed out that Budde's results may be interpreted just as well by assuming that the heat absorbing side reaction is not the dissociation of  $S_2$  but the reaction of sulfur with water. The foregoing value, therefore, is not a reliable one. Bjerrum<sup>3</sup> estimated, from Budde's<sup>1</sup> data,  $D = -80$ . From vapor density data, von Wartenberg<sup>3</sup> estimated  $D = -90$ . Nernst<sup>4</sup> found that  $S_2$  is 80 per cent dissociated at  $2200^\circ$ . Computing the free energy change from this value and utilizing the entropy and heat capacity values given by Lewis and Randall,<sup>1</sup> we have obtained  $D = -48$ . The heat of formation of gaseous monatomic sulfur can be evaluated accurately from spectroscopic data. For the energy of dissociation of normal  $S_2(g)$  into normal  $S$  atoms, Christy and Naudé,<sup>1</sup> reported the value 4.45 volt-electrons. See also Henri<sup>3</sup> and Kondratjew.<sup>1</sup>

The electronic energy states of the sulfur atom are evaluated from the data of Fowler,<sup>3</sup> Birge,<sup>2</sup> Hopfield,<sup>2, 3</sup> and Runge and Paschen.<sup>1</sup> See also

Frerichs<sup>3</sup> and Bacher and Goudsmit.<sup>1</sup> The energies of the sulfur atom in various stages of ionization are taken from Ingram,<sup>1, 2</sup> Millikan and Bowen,<sup>1, 2</sup> Bowen,<sup>4</sup> and Bowen and Millikan.<sup>1, 2</sup>

$S^{--} (g)$ . The electron affinity of the sulfur atom is calculated in the same manner as for the oxygen atom. Sherman<sup>1</sup> reported for the lattice energies of  $MgS$ ,  $CaS$ ,  $SrS$ , and  $BaS$ , the values 778.3, 721.8, 687.4, and 655.9, respectively. Lennard-Jones<sup>1</sup> and Taylor<sup>1</sup> gave for  $MgS$  and  $CaS$ , 784 and 728, respectively. Our individual values for the electron affinity of  $S (g)$ , calculated from the foregoing values, are different from those computed by Sherman,<sup>1</sup> but our average value is the same as his, namely,  $-79.5$  for the reaction,  $S (g) + 2 \theta = S^{--} (g)$ .

$SO_2 (g)$ . Calorimetric determinations of the heat of formation of sulfur dioxide from solid sulfur and oxygen were made by Dulong,<sup>2</sup> Andrews,<sup>14</sup> Favre and Silbermann,<sup>1</sup> Hess,<sup>7</sup> Thomsen,<sup>15</sup> Berthelot,<sup>45, 65</sup> Giran,<sup>6</sup> Frost,<sup>1</sup> and Eckman and Rossini.<sup>1</sup> The first four investigations are of historical interest only.

Thomsen<sup>15</sup> burned solid sulfur in a stream of oxygen gas at constant pressure in his calorimeter. The appreciable amounts of sulfur trioxide which were formed along with the sulfur dioxide in Thomsen's experiments were determined by weighing, and a heat correction was applied. The amount of sulfur dioxide was determined by absorbing it in strong chromic acid solution and weighing. Thomsen's data yield  $Q = 71.08$  and  $71.72$  for the heats of combustion of solid rhombic and solid monoclinic sulfur, respectively, in oxygen to form gaseous sulfur dioxide. These values, incidentally, give much too large (about 7 times) a value for the heat of transition of monoclinic to rhombic sulfur.

Berthelot<sup>45, 65</sup> burned rhombic sulfur in oxygen in a bomb at constant volume. The amounts of sulfur dioxide along with the lesser amounts of sulfur trioxide were absorbed and determined by titration with iodine exactly equivalent to the amount of sulfur burned. In another series, Berthelot used aqueous potassium hydroxide to absorb the products of combustion, titrating afterwards with iodine. His data from the two series of experiments yield, respectively,  $Q = 69.4$  and  $69.1$ , for the reaction,  $S (c, \text{rhombic}) + O_2 (g) = SO_2 (g)$ . Ferguson<sup>1</sup> reviewed Berthelot's data and discarded the results of his second series on the grounds of unreliability of the analytical method.

Giran<sup>6</sup> determined the heat of combustion of sulfur in a bomb at constant volume with various pressures of oxygen. The observed heats of combustion varied linearly from  $70.4$  at  $2.5$  atmospheres to  $81.1$  at  $45$  atmospheres. Extrapolation to zero pressure yields  $Q = 69.5$ .

Frost<sup>1</sup> carried out experiments on two reactions:  $S (c, \text{rhombic}) + \frac{2}{3} KIO_3 (aq.) + O_2 (g) + \frac{4}{3} H_2O (liq.) = I_2 (c) + \frac{4}{3} H_2SO_4 (aq.) + \frac{1}{3} K_2SO_4 (aq.)$ , and  $SO_2 (liq.) + \frac{2}{3} KIO_3 (aq.) + \frac{4}{3} H_2O (liq.) = I_2 (c) + \frac{4}{3} H_2SO_4 (aq.) + \frac{1}{3} K_2SO_4 (aq.)$ . The difference gives the reaction,  $S (c, \text{rhombic}) + O_2 (g) = SO_2 (liq.)$ . For the first reaction Frost<sup>1</sup> found at constant volume  $Q = 133.2^{23.9}$ ,  $132.7^{26.2}$ , and  $132.4^{24.3}$ , using about  $0.03$  mole of sulfur in

each experiment. Frost<sup>1</sup> found that these results showed a trend much greater than the calorimetric error, and selected  $Q=134$ . For the second reaction Frost<sup>1</sup> found, at constant volume,  $Q=60.06$ ,  $60.01$ , and  $60.03$ . Thus for the third reaction above these data yield  $Q=74.6$  at constant pressure. Taking the heat of vaporization of liquid sulfur dioxide as  $-6.0$ , we have obtained from these data, for  $\text{SO}_2$  (g),  $Q_f=68.6$ .

Eckman and Rossini<sup>1</sup> made a careful determination of the heat of formation of gaseous sulfur dioxide under conditions which completely favored a pure reaction,—no sulfur trioxide being formed. This was accomplished by burning oxygen gas in an excess of sulfur vapor at constant pressure in a calorimeter. The reaction took place in a flame where the stream of oxygen gas entered the chamber containing the sulfur vapor. The amount of reaction was determined from the mass of sulfur which disappeared, and, as a check, from the amount of sulfur dioxide formed by absorbing it in a sodium hydroxide-asbestos mixture and weighing. Their data yield, for  $\text{SO}_2$  (g),  $Q_f=70.92 \pm 0.05$ .

**$\text{SO}_2$  (liq.).** Vapor pressure data were reported by Faraday,<sup>3</sup> Young,<sup>2</sup> Cardoso and Fiorentino,<sup>1</sup> Henning and Stock,<sup>1</sup> Mund,<sup>1</sup> Mills,<sup>1</sup> Bergstrom,<sup>2,3</sup> Burrell and Robertson,<sup>1</sup> Regnault,<sup>7</sup> Pictet,<sup>1</sup> and Blumcke.<sup>1</sup> See also Antione.<sup>3</sup> The heat of vaporization of liquid sulfur dioxide was measured directly by Eucken,<sup>2,3</sup> Estreicher and Schnee,<sup>1</sup> Chappuis,<sup>2</sup> Estreicher,<sup>2</sup> Mathias,<sup>1</sup> Schnee,<sup>1</sup> Cailletet and Mathias,<sup>1,2</sup> and Smith.<sup>1</sup> The last named found  $V=-6.07^{10}$ .

**$\text{SO}_2$  (c).** Vapor pressure data on solid and liquid sulfur dioxide were reported by Bergstrom,<sup>2,3</sup> Burrell and Robertson,<sup>1</sup> and Steele and Bagster.<sup>1</sup> These data yield for the heats of sublimation and vaporization of the solid and liquid near the melting point,  $-8.56$  and  $-6.64$ , respectively; whence  $F=-1.9$  at the melting point.

**$\text{SO}_2$  (aq.).** From the vapor pressure data of Lindner<sup>1,2</sup> on aqueous solutions of sulfur dioxide, Bichowsky<sup>3</sup> deduced the following values for the heat of solution of  $\text{SO}_2$  (g) in water:  $6.68_{90}$ ;  $6.90_{200}$ ;  $6.97_{290}$ ;  $7.70_{1500}$ ;  $9.13_{6600}$ . These values are in fair agreement with the recent data of Stiles and Felsing,<sup>1</sup> who measured directly the heat of solution, and gave  $Q=0.911+1.1053 \log n$ , where  $n$  is the number of moles of water per mole of  $\text{SO}_2$ . Ramstetter and Hantke<sup>1</sup> reported  $S=8.02_{40}$ . Values computed from the vapor pressure data of Maass and Maass<sup>1</sup> are in accord with those of Stiles and Felsing.<sup>1</sup> Data on the solubility of  $\text{SO}_2$  in water were reported by Hudson,<sup>1</sup> Roozeboom,<sup>1</sup> Burrell and Robertson,<sup>1</sup> McCrae and Wilson,<sup>1</sup> Freeze,<sup>1</sup> and Oman.<sup>1</sup> The old direct calorimetric data of Berthelot,<sup>92</sup> de Forcrand,<sup>4</sup> and Favre and Silbermann<sup>3</sup> are now of historical interest only. Thomsen<sup>15</sup> measured the heat of solution of  $\text{SO}_2$  (liq.) in water to be  $1.444_{210}$  and  $1.564_{310}$ .

**$\text{SO}_3^{--}$  (aq.).** From the various values for  $\text{Na}_2\text{SO}_3$  (aq.) and  $\text{K}_2\text{SO}_3$  (aq.), we have computed, for  $\text{SO}_3^{--}$  (aq.),  $Q_f=148.2$ ,  $149.2$ , and  $150.7$ , respectively.

**$\text{S}_2\text{O}_8^{--}$  (aq.).** Berthelot<sup>63, 107</sup> measured the heat of the reaction,

$\text{BaS}_2\text{O}_8 \text{ (aq.)} + \text{H}_2\text{SO}_4 \text{ (220)} = \text{BaSO}_4 \text{ (c)} + \text{H}_2\text{S}_2\text{O}_8 \text{ (aq.)}$ . From our values for the last three substances, we have computed, for  $\text{BaS}_2\text{O}_8 \text{ (aq.)}$ ,  $Q_f = 451.7$ ; whence, taking for  $\text{Ba}^{++} \text{ (aq.)}$ ,  $Q_f = 128.4$ , one finds for  $\text{S}_2\text{O}_8^{--} \text{ (aq.)}$ ,  $Q_f = 323.3$ .

$\text{HSO}_3^- \text{ (aq.)}$ . From the values of the heats of formation of  $\text{NaHSO}_3 \text{ (aq.)}$  and  $\text{KHSO}_3 \text{ (aq.)}$ , we have calculated, for  $\text{HSO}_3^- \text{ (aq.)}$ ,  $Q_f = 148.8$  and  $149.4$ , respectively.

$\text{S}_2\text{O}_5^{--} \text{ (aq.)}$ . We have taken equal to zero the heat of the reaction,  $2 \text{HSO}_3^- \text{ (aq.)} = \text{H}_2\text{O (liq.)} + \text{S}_2\text{O}_5^{--} \text{ (aq.)}$ .

$\text{SO}_2 \cdot 7 \text{H}_2\text{O (c)}$ . The solid hydrate of  $\text{SO}_2$  is now usually accepted as having 7 moles of water. The dissociation pressure of this compound was measured at various temperatures by Villard<sup>2, 10</sup> and Roozeboom.<sup>4</sup> The data of the latter yield, for  $\text{SO}_2 \cdot 7 \text{H}_2\text{O (c)} = \text{SO}_2 \text{ (g)} + 7 \text{H}_2\text{O (c)}$ ,  $Q = -7.78$  at  $0^\circ$ .

$\text{SO (g)}$ . The band spectra of sulfur dioxide indicate the existence of a diatomic molecule. From a study of the predissociation limits in sulfur dioxide, Henri<sup>2</sup> and Henri and Wolff<sup>1</sup> deduced the following:  $\text{SO}_2 \text{ (g)} = \text{SO (g)} + \text{O (g)}$ ,  $Q = -112.5$ ;  $\text{SO (g)} = \text{S (g)} + \text{O (g)}$ ,  $Q = -148$ . These values yield for  $\text{SO (g)}$ ,  $Q_f = 17.5$  and  $23$ , respectively. Martin<sup>1</sup> carefully reinvestigated these spectra, and concluded that the normal state of  $\text{SO}$  is  $^3\Sigma$  and that it dissociates into a normal  $\text{S}$  atom and a normal  $\text{O}$  atom with  $D^\circ = -118.2$ . Hence, for  $\text{SO (g)}$ ,  $Q_f = -6.3$ .

$\text{H}_2\text{S (g)}$ . Thomsen<sup>15</sup> determined the heat of formation of  $\text{H}_2\text{S (g)}$  by burning it in oxygen in his flame calorimeter. The reaction is not a clear cut one, there being a considerable quantity of sulfuric acid spray formed along with the  $\text{SO}_2$  and  $\text{H}_2\text{O}$ . For  $\text{H}_2\text{S (g)}$ , Thomsen<sup>15</sup> reported  $Q_f = 2.73$ . We have carefully recomputed his calorimetric and analytical data and have deduced for the reaction,  $\text{H}_2\text{S (g)} + \frac{3}{2} \text{O}_2 \text{ (g)} = \text{H}_2\text{O (liq.)} + \text{SO}_2 \text{ (g)}$ ,  $Q = 134.10$  whence, for  $\text{H}_2\text{S (g)}$   $Q_f = 5.2$ . Thomsen<sup>15</sup> also measured the heat of the reaction  $\text{I}_2 \text{ (c)} + \text{HI (aq.)} + \text{H}_2\text{S (g)} = 3 \text{HI (aq.)} + \text{S (solid)}$ . The sulfur precipitated was the usual plastic form, the heat of inversion of which into rhombic sulfur we have taken as  $0.3$  (following the discussion of Pollitzer<sup>1</sup>). For the above reaction, Thomsen<sup>15</sup> found  $Q = 21.6$ , whence we have computed, for  $\text{H}_2\text{S (g)}$ ,  $Q_f = 5.5$ . Pollitzer<sup>1</sup> measured the equilibria in the reaction,  $\text{I}_2 \text{ (c)} + \text{H}_2\text{S (g)} = 2 \text{HI (g)} + \text{S (c, rhombic)}$ , at various temperatures, and gave  $Q = 17.20$ ; whence, for  $\text{H}_2\text{S (g)}$ ,  $Q_f = 5.4$ . Another value for the heat of formation of hydrogen sulfide is obtained from the equilibrium data on the reaction,  $\text{S (c, rhombic)} + \text{H}_2 \text{ (g)} = \text{H}_2\text{S (g)}$ , which are discussed by Lewis and Randall.<sup>5</sup> These last data yield, for  $\text{H}_2\text{S (g)}$ ,  $Q_f = 5.0$ .

$\text{H}_2\text{S (liq.)}$ . By direct measurement, Estreicher and Schneer<sup>1</sup> found  $V = -4.49$ <sup>-61.4</sup>; Elliott and McIntosh<sup>1</sup> gave  $V = -4.68$ . The vapor pressure data of Cailletet and Bordet,<sup>1</sup> Regnault,<sup>6</sup> Maass and McIntosh,<sup>2</sup> Steele and Bagster,<sup>1</sup> and Steele, McIntosh, and Archibald<sup>1</sup> yield  $V = -4.5$ .

$\text{H}_2\text{S (c)}$ . The vapor pressure data of Maass and McIntosh<sup>2</sup> yield

−4.95 for the heat of sublimation of  $\text{H}_2\text{S}$  (c). See also Steele, McIntosh, and Archibald.<sup>1</sup>

$\text{H}_2\text{S} \cdot 6 \text{H}_2\text{O}$  (c). The vapor pressures of this solid hydrate in the presence of a solution of  $\text{H}_2\text{S}$  in  $\text{H}_2\text{O}$  and of  $\text{H}_2\text{O}$  in  $\text{H}_2\text{S}$ , which two liquid solutions are immiscible, were measured by Caillietet and Bordet,<sup>1</sup> McLaughlan,<sup>1</sup> Scheffer,<sup>1, 6</sup> Scheffer and Meyer,<sup>1, 2</sup> and Schrienemaker.<sup>1</sup> de Forcrand and Fonzes-Diacon<sup>1</sup> computed, from the foregoing data,  $Q = -16.5$  for the reaction  $\text{H}_2\text{S} \cdot 6 \text{H}_2\text{O}$  (c) =  $6 \text{H}_2\text{O}$  (liq.) +  $\text{H}_2\text{S}$  (g).

$\text{H}_2\text{S}$  (aq.). Thomsen<sup>15</sup> found, by direct measurement, the heat of solution of  $\text{H}_2\text{S}$  (g) in water to be 4.75. The solubility data of Scheffer<sup>1, 6</sup> and Winkler<sup>7</sup> yield 4.56 and 4.86, respectively.

$\text{S}^-$  (aq.). From the values of the heats of formation of  $\text{Na}_2\text{S}$  ( $\infty$ ),  $\text{Na}^+$  ( $\infty$ ),  $\text{K}_2\text{S}$  ( $\infty$ ), and  $\text{K}^+$  ( $\infty$ ), we have computed, for  $\text{S}^-$  ( $\infty$ ),  $Qf = -9.86$  and  $-10.14$ , respectively.

$\text{S}_2^-$  (aq.),  $\text{S}_3^-$  (aq.),  $\text{S}_4^-$  (aq.). From the values of  $Qf$  for the aqueous polysulfides of sodium, we have obtained the values for these ions.

$\text{HS}^-$  (aq.). From the values of  $Qf$  for  $\text{NaHS}$  ( $\infty$ ),  $\text{Na}^+$  ( $\infty$ ),  $\text{KHS}$  ( $\infty$ ), and  $\text{K}^+$  ( $\infty$ ) we have found, for  $\text{HS}^-$  ( $\infty$ ), assuming no dissociation,  $Qf = 3.95$  and  $3.85$ , respectively.

$\text{H}_2\text{S}_5$  (liq.). Sabatier<sup>1</sup> found for the reaction,  $\text{H}_2\text{S}_5$  (liq.) =  $\text{H}_2\text{S}$  (g) +  $4 \text{S}$  (solid),  $Q = 2.7$ . Assuming that the sulfur formed was rhombic, one finds, for  $\text{H}_2\text{S}_5$  (liq.),  $Qf = 2.6$ .

$\text{H}_2\text{S}_2$  (liq.). We have estimated for the reaction,  $\text{H}_2\text{S}_2$  (liq.) +  $3 \text{S}$  (c) =  $\text{H}_2\text{S}_5$  (liq.),  $Q = 3$ ; whence, for  $\text{H}_2\text{S}_2$  (liq.),  $Qf = -0.4$ . This value lies between those for  $\text{H}_2\text{S}$  (liq.) and  $\text{H}_2\text{S}_5$  (liq.).

$\text{H}_2\text{S}_2$  (g). Butler and Maass<sup>1</sup> measured the heat of vaporization of liquid  $\text{H}_2\text{S}_2$ .

$\text{H}_2\text{S}_2$  (c). Butler and Maass<sup>1</sup> measured the heat of fusion.

$\text{H}_2\text{SO}_4$  (aq.). Thomsen<sup>15</sup> measured the heat of reaction of gaseous chlorine with aqueous sulfur dioxide to form a mixture of aqueous hydrochloric and sulfuric acids. We have recomputed in detail the data of Thomsen's three experiments on this reaction, and have obtained, for  $\text{SO}_2$  (2400) +  $\text{Cl}_2$  (g) +  $2\text{H}_2\text{O}$  (liq.) =  $2\text{HCl}$  (800) +  $\text{H}_2\text{SO}_4$  (800),  $Q = 73.84 \pm 0.10$ ; whence, anticipating the value for the heat of dilution, one finds, for  $\text{H}_2\text{SO}_4$  (200),  $Qf = 210.3$ . Berthelot,<sup>45, 135, 136</sup> measured the heat of reaction of liquid bromine with aqueous sulfur dioxide, and also that of solid bromine with aqueous sulfur dioxide. His data yield, respectively, for  $\text{H}_2\text{SO}_4$  (200?),  $Qf = 212.6$  and  $210.3$ . Mixer<sup>15</sup> measured in a bomb calorimeter the heat of reaction of rhombic sulfur with sodium peroxide,  $\text{S}$  (c, rhombic) +  $3\text{Na}_2\text{O}_2$  (c) =  $\text{Na}_2\text{SO}_4$  (c) +  $2 \text{Na}_2\text{O}$  (c), and found  $Q = 168.6$ . Utilizing our values for the heats of formation of  $\text{Na}_2\text{O}_2$  (c),  $\text{Na}_2\text{O}$  (c), the heat of solution of  $\text{Na}_2\text{SO}_4$  (c) in  $400 \text{H}_2\text{O}$ , the heat of neutralization of  $\text{H}_2\text{SO}_4$  (200) with  $2\text{NaOH}$  (100), and the heat of formation of  $\text{NaOH}$  (100), we have computed, for  $\text{H}_2\text{SO}_4$  (200),  $Qf = 210.4$ . Utilizing the data obtained by Frost<sup>1</sup> on the reaction between liquid  $\text{SO}_2$  and aqueous  $\text{KIO}_3$ , which has been discussed under the section on  $\text{SO}_2$  (g), we have computed,

for  $\text{H}_2\text{SO}_4$  (200),  $Q_f=213.7$ . This value is given little weight because of the large heats of mixing involved. Roth, Grau, and Meichsner<sup>1</sup> recently measured the heat of reaction of aqueous hydrogen peroxide with gaseous sulfur dioxide, and the heat of decomposition of aqueous hydrogen peroxide into water and oxygen. Combining their data on these two reactions, we have computed, for  $\text{SO}_2(\text{g}) + \text{H}_2\text{O}(\text{liq.}) + \frac{1}{2}\text{O}_2(\text{g}) = \text{H}_2\text{SO}_4(800)$ ,  $Q = 73.09$ ; whence for  $\text{H}_2\text{SO}_4(200)$ ,  $Q_f=211.6$ . The data of Hess<sup>7, 9</sup> are of historical interest only.

The heat of dilution of aqueous sulfuric acid was measured by many investigators. The data of Favre and Silbermann,<sup>3</sup> Favre and Quailard,<sup>1</sup> Thomsen,<sup>15</sup> Pfaundler,<sup>5</sup> Pickering,<sup>9</sup> and Rümelin,<sup>1</sup> were summarized by Brönsted.<sup>7</sup> The values deduced by Brönsted<sup>7</sup> have been experimentally verified and extended by Grau and Roth,<sup>1</sup> who reported values from 1 to 20,000  $\text{H}_2\text{O}$ . Other data are given by Naudé,<sup>2</sup> Berthelot,<sup>48, 111</sup> Muller,<sup>7</sup> and Mathias.<sup>1</sup> See also Bose,<sup>2</sup> Wilson,<sup>1</sup> and Porter.<sup>2</sup> The value of  $Q_f$  for  $\text{H}_2\text{SO}_4(\infty)$  is taken as equal to that for  $\text{SO}_4^{--}(\infty)$ .

$\text{H}_2\text{SO}_4(\text{liq.})$ . Brönsted<sup>7</sup> and Grau and Roth<sup>1</sup> measured the heat of solution of liquid sulfuric acid in water and of water in liquid sulfuric acid. Their data yield, respectively, for  $\text{H}_2\text{SO}_4(\text{liq.})$ ,  $Q_f=193.73$  and  $193.75$ . For the heat of solution of liquid sulfuric acid, Berthelot<sup>48</sup> found  $16.92_{150}$  and Thomsen<sup>15</sup>  $17.85_{1600}$ .

$\text{H}_2\text{SO}_4(\text{C}_2\text{H}_5\text{OC}_2\text{H}_5)$ . Hantzsch<sup>1</sup> measured the heat of solution of liquid sulfuric acid in diethyl ether.

$\text{H}_2\text{SO}_4(\text{c.})$ . The data on the heat of fusion of solid sulfuric acid are: Berthelot,<sup>3, 6, 132</sup>  $-0.86$ ; Pickering,<sup>13</sup>  $-2.35$ ; Hantzsch,<sup>2</sup>  $-2.258$ ; Knietzsch (see Hantzsch<sup>2</sup>),  $-2.24$ ; Brönsted,<sup>7</sup>  $-2.55^{10.5}$ .

$\text{H}_2\text{SO}_4 \cdot \text{H}_2\text{O}(\text{c.})$ . The data on the heat of fusion of the hydrate are: Berthelot,<sup>3, 6, 132</sup>  $-3.680$ ; Hammerl,<sup>3</sup>  $-3.420$ ,  $-3.536$ ; Pickering,<sup>13</sup>  $-3.92$ ; Brönsted,<sup>7</sup>  $-4.290-0.0188 t$ . Brönsted's<sup>7</sup> data yield  $F=-4.45$  at the melting point,  $8.60^\circ$ .

$\text{SO}_4^{--}(\text{aq.})$ . From the values of the heats of formation of  $\text{Li}_2\text{SO}_4(\infty)$ ,  $\text{Li}^+(\infty)$ ,  $\text{Na}_2\text{SO}_4(\infty)$ ,  $\text{Na}^+(\infty)$ ,  $\text{K}_2\text{SO}_4(\infty)$ , and  $\text{K}^+(\infty)$ , we have computed, for  $\text{SO}_4^{--}(\infty)$ ,  $Q_f=215.71$ ,  $215.76$ , and  $215.94$ , respectively.

$\text{SO}_3(\text{liq.})$ . The data on the heat of solution of liquid sulfur trioxide in water are: Thomsen,<sup>15</sup>  $39.17_{1600}$ ; Giran,<sup>3</sup>  $39.4_{400}$ ; Grau and Roth,<sup>2</sup>  $41.18_{5000}$ .

$\text{SO}_3(\text{g.})$ . Berthelot<sup>66</sup> found for the heat of solution of gaseous sulfur trioxide in water,  $S=49.2_{200}$ , whence, for  $\text{SO}_3(\text{g.})$ ,  $Q_f=93.9$ . Giran<sup>3</sup> reported, for the heat of vaporization of liquid sulfur trioxide,  $V=-9.4$ ; Grau and Roth<sup>2</sup> found  $V=-10.0 \pm 0.4$ . From the latter value we have computed, for  $\text{SO}_3(\text{g.})$ ,  $Q_f=94.2$ . The vapor pressure data of Berthout,<sup>1</sup> Smits and Schoenmaker,<sup>1, 2</sup> and Grau and Roth<sup>2</sup> yield, respectively,  $V=-10.37$ ,  $-10.40$ , and  $-10.22$ . The average of these values yields, for  $\text{SO}_3(\text{g.})$ ,  $Q_f=93.9$ . From a study of predissociation in the absorption spectra of gaseous sulfur trioxide, Dutt<sup>1</sup> deduced  $\text{SO}_3(\text{g.})=\text{SO}_2(\text{g.})$

+ O (g) ( $^3P$ ),  $D^{\circ} = -86.7$  and  $SO_3(g) = SO_2(g) + O(g)$  ( $^1D_2$ ),  $D^{\circ} = -125$ . From these data we have computed, for  $SO_3(g)$ ,  $Q_f = 99$  and  $92$ , respectively. The data of Hess<sup>7</sup> on sulfur trioxide are of historical interest only.

$SO_3(c, \alpha)$ ,  $SO_3(c, \beta)$ . There are two crystalline forms of solid sulfur trioxide, the "ice-like" or  $\alpha$  form which melts sharply at  $16.8^{\circ}$ , and the "wool-like" or  $\beta$  form which is stable above  $16.8^{\circ}$  but does not appear to be well defined. The vapor pressure data of Smits and Schoenmaker,<sup>1, 2</sup> yield  $-12.1$  for the heat of sublimation of  $SO_3(c, \alpha)$ , whence  $Q_f = 106.0$ . Berthelot,<sup>6, 9</sup> and Grau and Roth<sup>1</sup> measured the heat of solution of  $SO_3(c, \beta)$  in water. Their data yield  $Q_f = 105.8$  and  $105.2$ , respectively. Grau and Roth<sup>1</sup> showed that the heat of solution varied considerably with the sample, indicating that the "wool-like" or  $\beta$  form of sulfur trioxide may be a mixture of varying composition.

$H_2S_2O_7(c)$ . Thomsen<sup>15</sup> measured the heat of solution.

$H_2S_2O_7(liq.)$ . Auerbach<sup>1</sup> measured the heat of fusion of the solid.

$H_2S_2O_8(aq.)$ . Berthelot<sup>63, 107</sup> measured the heats of reaction of  $H_2S_2O_8(220)$  with  $(FeSO_4 + H_2SO_4)(440)$  and of  $H_2O_2(aq.)$  with  $(FeSO_4 + H_2SO_4)(440)$ . The difference in these heats of reaction gives that for  $H_2S_2O_8(220) + 2H_2O(liq.) = 2H_2SO_4(220) + H_2O_2(aq.)$ . Berthelot's data on two preparations of aqueous persulfuric acid yield for this reaction  $Q = 13.5$  and  $13.4$ , respectively. Berthelot<sup>63, 107</sup> also obtained data on two other series of reactions, using instead of  $H_2S_2O_8(220)$ , the mixtures  $((NH_4)_2S_2O_8 + H_2SO_4)(aq.)$  and  $(K_2S_2O_8 + H_2SO_4)(aq.)$ , respectively. These data give for the foregoing reaction,  $Q = 13.2$  and  $13.0$ , respectively. Taking the value  $13.4$ , we have computed, for  $H_2S_2O_8(aq.)$ ,  $Q_f = 318.5$ . Berthelot's<sup>63, 107</sup> data on the reaction of aqueous sulfurous acid with aqueous persulfuric acid yield a value for the heat of formation of the latter that is in accord with the foregoing.

$S_2O_7(c)$ . Giran,<sup>6</sup> by an indirect method of which he does not give the details, computed the heat of solution of solid persulfuric acid anhydride to be  $56.7$ .

$S_2O_3^{--}(aq.)$ . This value is obtained from those for  $Na_2S_2O_3(aq.)$  and  $Na^+(aq.)$ .

$S_2O_6^{--}(aq.)$ . This value is obtained from those for  $K_2S_2O_6(aq.)$  and  $K^+(aq.)$ .

$H_2S_2O_6(aq.)$ . Thomsen<sup>15</sup> found  $N_{1200} = 27.07$ .

$S_3O_6^{--}(aq.)$ . From the values for  $Na_2S_3O_6(aq.)$  and  $K_2S_3O_6(aq.)$ , we have found, for  $S_3O_6^{--}(aq.)$ ,  $Q_f = 279.6$  and  $278.3$ , respectively.

$S_4O_6^{--}(aq.)$ . The value is obtained from those for  $Na_2S_4O_6(aq.)$  and  $Na^+(aq.)$ .

$H_2S_4O_6(aq.)$ . Assuming tetrathionic acid to be completely ionized, one finds  $Q_f$  for  $H_2S_4O_6(aq.)$  equal to that for  $S_4O_6^{--}(aq.)$ .

$S_5O_6^{--}(aq.)$ . This value is obtained from those for  $K_2S_5O_6(aq.)$  and  $K^+(aq.)$ .

$S_2O_4^{--}(aq.)$ . Berthelot<sup>40</sup> measured the heat of reaction between oxy-

gen gas and a sodium sulfite solution freshly reduced by zinc. Presumably the active ion is  $\text{S}_2\text{O}_4^{--}$ ; and, if so, the reaction is  $\text{S}_2\text{O}_4^{--}(\text{aq.}) + \text{H}_2\text{O}(\text{liq.}) + \frac{1}{2} \text{O}_2(\text{g.}) = 2\text{HSO}_3^-(\text{aq.})$ . Berthelot found  $Q = 67.8$ , whence we have computed, for  $\text{S}_2\text{O}_4^{--}(\text{aq.})$ ,  $Q_f = 161.8$ .

$\text{S}_2\text{Cl}_2(\text{liq.})$ . For the heat of formation of liquid  $\text{S}_2\text{Cl}_2$ , Thomsen<sup>15</sup> found 14.26; Trautz,<sup>6</sup> 14.5; and Ogier,<sup>6</sup> 17.6.

$\text{S}_2\text{Cl}_2(\text{g.})$ . For the heat of vaporization of liquid  $\text{S}_2\text{Cl}_2$ , Ogier<sup>6</sup> found  $-6.7$  by direct measurement; Orndorff and Terrasse<sup>1</sup> reported  $-8.7$  from data on boiling point elevation; Harvey and Schuette<sup>1</sup>  $-8.65$  from vapor pressure data; and Trautz, Rick, and Acker<sup>1</sup>  $-8.5$  from vapor pressure data. Gaseous  $\text{S}_2\text{Cl}_2$  is partly dissociated.

$\text{S}_2\text{Cl}_4(\text{liq.})$ ,  $\text{SCL}_4(\text{liq.})$ . Trautz<sup>9</sup> and Ogier<sup>6</sup> measured the heat of solution of chlorine in liquid  $\text{S}_2\text{Cl}_2$ , and, for the more or less imaginary reaction,  $\text{S}_2\text{Cl}_2(\text{liq.}) + \text{Cl}_2(\text{g.}) = \text{S}_2\text{Cl}_4(\text{liq.})$ , reported  $Q = 9.8$  and  $5.8$ , respectively. Absorption of 3 moles of  $\text{Cl}_2$  per mole of  $\text{S}_2\text{Cl}_2$  leads to values of  $Q = 12$  to  $14$  for the assumed reaction  $\text{S}_2\text{Cl}_2(\text{liq.}) + 3 \text{Cl}_2(\text{g.}) = 2 \text{SCL}_4(\text{liq.})$ . Thomsen<sup>15</sup> and Beckmann<sup>5</sup> noted that heat was evolved in the first reaction. Aten<sup>1</sup> quoted their results to prove the existence of  $\text{S}_2\text{Cl}_4$ , but the evidence in favor of the existence of  $\text{S}_2\text{Cl}_4$  is not convincing, especially since the accepted freezing point diagram for the  $\text{Cl}_2$ -S system shows only two well defined solid compounds,  $\text{S}_2\text{Cl}_2$  and  $\text{SCL}_4$ . But we find it convenient, nevertheless, to give a value for the heat of formation of the hypothetical  $\text{S}_2\text{Cl}_4(\text{liq.})$ .

$\text{SO}_2\text{Cl}_2(\text{liq.})$ . Thomsen<sup>15</sup> discovered that solid iodine acted as a catalyst for the reaction,  $\text{SO}_2\text{Cl}_2(\text{liq.}) + 2\text{H}_2\text{O}(\text{liq.}) = (\text{H}_2\text{SO}_4 + 2\text{HCl})(1000)$ , and his calorimetric data yield for this reaction  $Q = 62.8$ . Ogier<sup>7</sup> measured the heat of solution of liquid sulfuryl chloride in aqueous KOH to be 119.8. These data yield for  $\text{SO}_2\text{Cl}_2(\text{liq.})$   $Q_f = 92.9$  and  $93.1$ , respectively.

$\text{SO}_2\text{Cl}_2(\text{g.})$ . The data on the heat of vaporization of liquid sulfuryl chloride are: Trautz,<sup>6</sup>  $-6.68$ , from direct calorimetric measurement; Trautz, Baisch, and von Dechend,<sup>1</sup>  $-6.68$ , from vapor pressure data; Ogier,<sup>7</sup>  $-7.1$ , from the difference in the heats of solution of the gas and the liquid. These data yield, for  $\text{SO}_2\text{Cl}_2(\text{g.})$ ,  $Q_f = 86.2$ ,  $86.2$ , and  $85.8$ , respectively. Trautz and von Dechend<sup>1</sup> computed, from equilibrium data for the reaction,  $\text{SO}_2(\text{g.}) + \text{Cl}_2(\text{g.}) = \text{SO}_2\text{Cl}_2(\text{g.})$ ,  $Q = 11.2$ ; whence, for  $\text{SO}_2\text{Cl}_2(\text{g.})$ ,  $Q_f = 82.1$ . See also Heumann and Käcklin.<sup>1</sup>

$\text{SOCl}_2(\text{liq.})$ . Ogier<sup>6, 7</sup> measured the heat of solution of liquid thionyl chloride in water.

$\text{SOCl}_2(\text{g.})$ . Ogier<sup>6, 7</sup> reported  $-6.5$  for the heat of vaporization of the liquid; Ariei,<sup>3</sup> from vapor pressure data, deduced the value  $-7.56$ .

$\text{S}_2\text{O}_5\text{Cl}_2(\text{liq.})$ . Ogier<sup>7</sup> found, for the heat of solution of liquid pyrosulfuryl chloride in 6 KOH (18),  $Q = 39.2$ ; whence, for  $\text{S}_2\text{O}_5\text{Cl}_2(\text{liq.})$ ,  $Q_f = 166.5$ .

$\text{S}_2\text{O}_5\text{Cl}_2(\text{g.})$ . Ogier<sup>7</sup> reported  $-13.2$  for the heat of vaporization. See also Grignard and Muret.<sup>1</sup>

**SO<sub>3</sub>HCl (liq.).** Ogier<sup>6</sup> measured the heat of formation of liquid sulfonic chloride from solid SO<sub>3</sub> (which we have assumed to be the wool-like form) and gaseous HCl, and the heat of solution of liquid SO<sub>3</sub>HCl in water. For these reactions, he found  $Q=14.3$  and  $40.3$ , respectively; whence we have computed, for SO<sub>3</sub>HCl (liq.),  $Q_f=141.6$  and  $143.0$ , respectively.

**S<sub>2</sub>Br<sub>2</sub> (liq.).** Ogier<sup>7</sup> and Peterson<sup>5</sup> reported for the reaction, 2S (c, rhombic) + Br<sub>2</sub> (liq.) = S<sub>2</sub>Br<sub>2</sub> (liq.),  $Q=4.0$  and  $3.6$ , respectively. It seems probable that both values are low.

**S<sub>2</sub>I<sub>2</sub> (solid).** According to Ogier<sup>7</sup> there is no heat effect on mixing sulfur and iodine.

**SOBr<sub>2</sub> (liq.).** Mayes and Partington<sup>1</sup> reported  $-10.40$  for the heat of vaporization at  $140^\circ$ . There is some decomposition at the boiling point.

**SF<sub>6</sub> (g).** Yost and Claussen<sup>1</sup> reported  $Q_f=262.0$ .

**SF<sub>6</sub> (c).** The data on the heat of sublimation are: Klemm and Henkel,<sup>1</sup>  $-5.57$ ; Yost and Claussen,<sup>1</sup>  $-5.64^{63.8}$ .

**SF<sub>6</sub> (liq.).** The data on the heat of fusion are: Klemm and Henkel,<sup>1</sup>  $-1.1$ ; Yost and Claussen,<sup>1</sup>  $-1.39^{50.8}$ .

## SELENIUM

**Se (solid).** The stable form of selenium is the gray metallic hexagonal Se (c, I). There are also the red monoclinic form, Se (c, III), the intermediate black monoclinic form, Se (c, II), and the vitreous form, which latter is apparently identical with precipitated selenium. Briegleb<sup>1</sup> gave a summary of the thermal properties of the various forms of solid selenium. Mondain-Monval<sup>1, 5</sup> measured the heats of transition directly, finding: Se (vitreous) = Se (c, I),  $Q^{125}=1.08$ ; Se (c, III) = Se (c, I),  $Q^{150}=0.18$ . Fabre,<sup>2</sup> from data on the difference in the heats of solution of the various forms of selenium in bromine, reported: Se (vitreous) = Se (c, I),  $Q=2.79$ ; Se (vitreous) = Se (amorphous),  $Q=0$ . Peterson,<sup>5</sup> from data on the differences in the heats of their reaction with chlorine, gave: Se (c, III) = Se (c, I),  $Q=0.70$ ; Se (vitreous) = Se (c, I),  $Q=1.05$ . There are no thermal data on Se (c, II).

**Se (liq.).** From data on the vapor pressures of Se (c, II) and Se (liq.) reported by Dodd,<sup>1</sup> Le Chatelier,<sup>3</sup> and Preuner and Brockmoller,<sup>1</sup> we have computed the heat of fusion to be  $-3.91$ , if the vapor is assumed to be Se<sub>8</sub>, and  $-2.9$ , if the vapor is Se<sub>6</sub>. From Mondain-Monval's<sup>1, 5</sup> values at  $125^\circ$ , we have computed  $F=-1.6$  at the melting point,  $220^\circ$ . This value agrees best with the assumption that the vapor has the composition Se<sub>8</sub> at the melting point.

**Se<sub>2</sub> (g), Se<sub>6</sub> (g), Se<sub>8</sub> (g).** From the vapor pressure data of Dodd,<sup>1</sup> we have computed for Se<sub>8</sub> (g),  $Q_f=-34.8$ , assuming that at the melting point of selenium its vapor is mostly Se<sub>8</sub>. By analogy with sulfur we have computed, for Se<sub>6</sub> (g),  $Q_f=-36$ . Preuner and Brockmoller<sup>1</sup> gave  $-56$  for the heat of the reaction Se<sub>6</sub> (g) = 3 Se<sub>2</sub> (g), whence, for Se<sub>2</sub> (g),

$Q_f = -30.7$ . This was computed from equilibrium values calculated from their vapor density data. Similar data were given by Biltz<sup>7</sup> and Deville and Troost.<sup>4</sup> Preuner and Brockmüller<sup>1</sup> and Bodenstein<sup>3</sup> estimated, from equilibrium data on the reaction,  $\text{H}_2\text{Se (g)} = \text{H}_2\text{(g)} + \frac{1}{2}\text{Se}_2\text{(g)}$ ,  $Q = -22.5$ , whence, anticipating the value for  $\text{H}_2\text{Se (g)}$ , we have computed, for  $\text{Se}_2\text{(g)}$ ,  $Q_f = -29.5$ .

**Se (g).** By analogy with  $\text{O}_2$  and  $\text{S}_2$ , we have estimated the energy of dissociation of  $\text{Se}_2$  to be  $-92$ , which value is in agreement with that estimated by von Wartenberg<sup>3</sup> from vapor density data.

The values of the energy states of gaseous monatomic selenium are taken from McLennan and Crawford.<sup>1</sup> Gibbs and Ruddy<sup>1</sup> reported a value for the ionization potential. The spectra of  $\text{Se}^+\text{(g)}$  have not been analyzed, but the higher spectra are discussed by Rao<sup>6</sup> and Sawyer and Humphreys.<sup>1</sup> See also Bacher and Goudsmit.<sup>1</sup>

**$\text{Se}^{--}\text{(aq.)}$ .** The values for aqueous selenide ion are obtained from those for  $\text{Li}_2\text{Se (aq.)}$ ,  $\text{Na}_2\text{Se (aq.)}$ ,  $\text{K}_2\text{Se (aq.)}$ .  $\text{Li}^+\text{(aq.)}$ ,  $\text{Na}^+\text{(aq.)}$ , and  $\text{K}^+\text{(aq.)}$

**$\text{SeO}_2\text{(aq.)}$ .** Thomsen<sup>15</sup> measured the heats of the following reactions:  $\text{Se (vitreous)} + \frac{1}{2}\text{Cl}_2\text{(g)} = \frac{1}{2}\text{Se}_2\text{Cl}_2\text{(liq.)}$ ,  $\frac{1}{2}\text{Se}_2\text{Cl}_2\text{(liq.)} + \frac{3}{2}\text{Cl}_2\text{(g)} = \text{SeCl}_4\text{(liq.)}$ , and  $\text{SeCl}_4\text{(liq.)} + 2\text{H}_2\text{O (liq.)} = (\text{SeO}_2 + 4\text{HCl})\text{(aq.)}$ . For these reactions, the data of Thomsen<sup>15</sup> yield  $Q = 11.26$ ,  $35.08$ , and  $30.37$ , respectively. Addition of the three reactions yields for  $\text{Se (vitreous)} + 2\text{Cl}_2\text{(g)} + 2\text{H}_2\text{O (liq.)} = (\text{SeO}_2 + 4\text{HCl})\text{(aq.)}$ ,  $Q = 76.71$ ; whence, for  $\text{SeO}_2\text{(aq.)}$ ,  $Q_f = 55.43$ . Thomsen<sup>15</sup> also measured the heat of the reaction  $\text{SeO}_2\text{(aq.)} + 2\text{HCl (aq.)} + \text{NaHS (aq.)} = \text{NaCl (aq.)} + 2\text{H}_2\text{O (liq.)} + \text{S (solid, ppt.)} + \text{Se (solid, ppt.)}$ . His data yield, for this reaction,  $Q = 73.40$ ; whence, for  $\text{SeO}_2\text{(aq.)}$ ,  $Q_f = 55.64$ .

**$\text{SeO}_2\text{(c.)}$ .** For the heat of solution of  $\text{SeO}_2\text{(c.)}$  in water, Thomsen<sup>15</sup> found  $S = -0.92_{200}$  and Jannek and Meyer,<sup>1</sup>  $S = -0.94_{100}$ . These data yield, for  $\text{SeO}_2\text{(c.)}$ ,  $Q_f = 54.50$ . Mixer<sup>10</sup> measured in a bomb calorimeter the heats of the reactions,  $3\text{Na}_2\text{O}_2\text{(c)} + \text{Se (c, III)} = \text{Na}_2\text{SeO}_4\text{(c)} + 2\text{Na}_2\text{O (c)}$  and  $\text{SeO}_2\text{(c)} + \text{Na}_2\text{O}_2\text{(c)} = \text{Na}_2\text{SeO}_4\text{(c)}$ . He found, for these reactions,  $Q = 95.90$  and  $71.20$ , respectively, and the difference gives for,  $\text{Se (c, III)} + 2\text{Na}_2\text{O}_2\text{(c)} = \text{SeO}_2\text{(c)} + 2\text{Na}_2\text{O (c)}$ ,  $Q = 24.70$ ; whence, for  $\text{SeO}_2\text{(c.)}$ ,  $Q_f = 65.1$ . This high value is due, as Mixer reported, to the fact that the second reaction did not go to completion.

**$\text{H}_2\text{SeO}_3\text{(c.)}$ .** Jannek and Meyer<sup>1</sup> measured the heat of solution in water. See also the vapor pressure data of Manchot.<sup>1</sup>

**$\text{SeO}_3^{--}\text{(aq.)}$ .** This value is computed from those for  $\text{Na}_2\text{SeO}_3\text{(aq.)}$  and  $\text{Na}^+(\infty)$ .

**$\text{HSeO}_3^-\text{(aq.)}$ .** This value is computed from those for  $\text{NaHSeO}_3\text{(aq.)}$  and  $\text{Na}^+(\infty)$ .

**$\text{H}_2\text{Se (g.)}$ .** Fabre<sup>1</sup> measured the heats of the reactions,  $\text{H}_2\text{Se (g)} + 2\text{FeCl}_3\text{(aq.)} = \text{Se (solid, ppt.)} + (2\text{FeCl}_2 + 2\text{HCl})\text{(aq.)}$  and  $2\text{H}_2\text{Se (g)} + \text{SeO}_2\text{(aq.)} = 3\text{Se (solid, ppt.)} + 2\text{H}_2\text{O (liq.)}$ . His data yield  $Q = 42.2$  and  $120.1$ , respectively; whence we have computed, for  $\text{H}_2\text{Se (g.)}$ ,  $Q_f$

= -18.5 and -19.8, respectively. Rolla's<sup>1</sup> data on the temperature coefficient of the equilibrium constant for the reaction,  $\text{H}_2\text{Se (g)} + \text{I}_2 \text{ (c)} = 2 \text{ HI (g)} + \text{Se (solid)}$ , yield, for  $\text{H}_2\text{Se (g)}$ ,  $Q_f = -16.9$ . Pelabon's<sup>1</sup> data on the equilibrium  $\text{H}_2\text{Se (g)} = \text{H}_2 \text{ (g)} + \text{Se (liq.)}$  yield, for  $\text{H}_2\text{Se (g)}$ ,  $Q_f = -19.0$ .

**$\text{H}_2\text{Se (aq.)}$ .** From data on the temperature coefficient of the solubility of  $\text{H}_2\text{Se}$  in water, McAmis and Felsing<sup>1</sup> computed the heat of solution of gaseous hydrogen selenide to be 2.43. From the similar but less accurate data of de Forcrand and Fonzes-Diacon,<sup>1,2</sup> we have computed  $S = 3.2$ . Fabre<sup>1</sup> measured the heats of reaction of aqueous  $\text{H}_2\text{Se}$  and gaseous  $\text{H}_2\text{Se}$  with aqueous  $\text{NaOH}$  and aqueous  $\text{KOH}$ , respectively. Proper differences of these reactions would give values for the heat of solution of  $\text{H}_2\text{Se}$  in water; but, unfortunately, the data when so treated yield  $S = 9.36$  and  $9.77$ , respectively,—values in sharp disagreement with the preceding ones. The discrepancy may be explained by assuming that Fabre erred in recording his data on the neutralizations with gaseous  $\text{H}_2\text{Se}$ . Fabre's value for the neutralization of aqueous  $\text{H}_2\text{Se}$  is in accord with similar data on the homologous  $\text{H}_2\text{S (aq.)}$ . If we assume that to Fabre's<sup>1</sup> data on the reaction between gaseous  $\text{H}_2\text{Se}$  and aqueous  $\text{NaOH}$  and  $\text{KOH}$  respectively the factor  $\frac{1}{2}$  should be applied, then one obtains, for  $\text{H}_2\text{Se (g)}$ ,  $S = 1.00$  and  $1.31$ , respectively.

**$\text{HSe}^- \text{ (aq.)}$ .** This value is obtained from those for aqueous  $\text{NaHSe}$  and  $\text{KHSe}$ .

**$\text{H}_2\text{SeO}_4 \text{ (aq.)}$ .** Thomsen<sup>15</sup> measured the heat of the reaction,  $\text{SeO}_2 \text{ (500)} + \text{HClO (700)} + \text{H}_2\text{O (liq.)} = (\text{H}_2\text{SeO}_4 + \text{HCl}) \text{ (1200)}$ , and his data yield  $Q = 29.78$ ; whence, neglecting the heat of mixing, we have computed, for  $\text{H}_2\text{SeO}_4 \text{ (1200)}$ ,  $Q_f = 143.8$ . Fabre's<sup>1</sup> data on the heat of the reaction,  $\text{Se (c)} + 3 \text{ Br}_2 \text{ (liq.)} + 4 \text{ H}_2\text{O (liq.)} = (\text{H}_2\text{SeO}_4 + 6 \text{ HBr}) \text{ (aq.)}$ , yield  $Q = 42.2$ ; whence, for  $\text{H}_2\text{SeO}_4 \text{ (aq.)}$ ,  $Q_f = 144.5$ . We have estimated the heat of dilution of aqueous selenic acid to be the same as that for sulfuric acid.

**$\text{H}_2\text{SeO}_4 \text{ (liq.)}$ .** Metzner<sup>1,2</sup> measured the heat of solution in water.

**$\text{H}_2\text{SeO}_4 \text{ (c.)}$ .** Metzner<sup>1,2</sup> measured the heat of solution in water.

**$\text{H}_2\text{SeO}_4 \cdot \text{H}_2\text{O (liq.)}$ .** Metzner<sup>1,2</sup> measured the heat of solution in water.

**$\text{H}_2\text{SeO}_4 \cdot \text{H}_2\text{O (c.)}$ .** Metzner<sup>1,2</sup> measured the heat of solution in water.

**$\text{SeO}_4^{--} \text{ (aq.)}$ .** From the values for  $\text{Na}_2\text{SeO}_4 \text{ (}\infty\text{)}$ ,  $\text{Na}^+ \text{ (}\infty\text{)}$ ,  $\text{K}_2\text{SeO}_4 \text{ (}\infty\text{)}$ , and  $\text{K}^+ \text{ (}\infty\text{)}$ , we have computed that for  $\text{SeO}_4^{--} \text{ (}\infty\text{)}$ .

**$\text{HSeO}_4^- \text{ (aq.)}$ .** We have computed this value from those for  $\text{NaHSeO}_4 \text{ (aq.)}$ ,  $\text{Na}^+ \text{ (}\infty\text{)}$ ,  $\text{KHSeO}_4 \text{ (aq.)}$ , and  $\text{K}^+ \text{ (}\infty\text{)}$ .

**$\text{SeF}_6 \text{ (g.)}$ .** Yost and Claussen<sup>1</sup> reported  $Q_f = 246.0$ .

**$\text{SeF}_6 \text{ (c.)}$ .** Klemm and Henkel<sup>1</sup> reported  $-6.72^{45}$  for the heat of sublimation; Yost and Claussen<sup>1</sup> reported  $-6.60^{46,6}$ .

**$\text{SeF}_6 \text{ (liq.)}$ .** Klemm and Henkel<sup>1</sup> gave  $-1.1$  for the heat of fusion of the solid; Yost and Claussen<sup>1</sup> reported  $-2.0^{34,6}$ .

**Se<sub>2</sub>Cl<sub>2</sub> (liq.).** Thomsen<sup>15</sup> and Peterson<sup>5</sup> measured the heat of formation of liquid Se<sub>2</sub>Cl<sub>2</sub> from vitreous selenium and gaseous chlorine. Their data yield  $Q = 22.13$  and  $21$ , respectively.

**SeCl<sub>4</sub> (c).** The data of Thomsen<sup>15</sup> on the reaction, Se<sub>2</sub>Cl<sub>2</sub> (liq.) + 3 Cl<sub>2</sub> (g) = 2 SeCl<sub>4</sub> (c), yield  $Q = 70.10$ ; whence, for SeCl<sub>4</sub> (c),  $Q_f = 46.12$ .

**SeCl<sub>2</sub> (g).** From data on the dissociation pressure of solid SeCl<sub>4</sub>, and on the vapor density of the dissociation products, Yost and Kircher<sup>1</sup> calculated, for SeCl<sub>4</sub> (c) = SeCl<sub>2</sub> (g) + Cl<sub>2</sub> (g),  $Q^{160} = -35.38$ ; whence, for SeCl<sub>2</sub> (g),  $Q_f = 10.0$ .

**SeO<sub>2</sub> · SO<sub>3</sub> (c).** Metzner<sup>1, 2</sup> measured the heat of solution in water.

#### TELLURIUM

**Te (c, II).** Standard state.

**Te (c, I).** Umino<sup>2</sup> measured the heat of transition.

**Te (solid, amorphous).** Damiens<sup>1</sup> found the heat of solution, in strong bromine water, of the quenched melt of tellurium and the amorphous or chemically precipitated tellurium to be zero and  $2.7$ , respectively, greater than that of Te (c, II).

**Te (liq.).** Umino<sup>2</sup> measured the heat of fusion of Te (c, I).

**Te<sub>2</sub> (g).** At temperatures above the boiling point, tellurium vapor is diatomic. The vapor pressure data of Doolan and Partington,<sup>1</sup> which were obtained at lower temperatures, do not extrapolate to the known boiling point, and indicate higher association of the vapor. See also Deville and Troost.<sup>4</sup> These data lead to the values  $V = -28.0^{600}$  and  $-20.0^{1500}$ , whence, for Te<sub>2</sub> (g),  $Q_f = -24$ . This value is not very certain.

**Te (g).** von Wartenberg<sup>3</sup> estimated, from vapor density measurements at  $2200^\circ$  and the Nernst equation, that the heat of dissociation of Te<sub>2</sub> (g) into 2 Te (g) is  $-87.0^{2200}$ . See also Biltz<sup>7</sup> and Deville and Troost.<sup>1, 4</sup>

McLennan and Crawford<sup>1</sup> gave data on the energy levels of monatomic gaseous tellurium. See also Bacher and Goudsmit.<sup>1</sup>

**TeCl<sub>4</sub> (c).** Thomsen's<sup>15</sup> data on the reaction, Te (c, II) + 2 Cl<sub>2</sub> (g) = TeCl<sub>4</sub> (c), yield, for the latter,  $Q_f = 77.4$ .

**TeO<sub>2</sub> (aq. HCl).** Thomsen<sup>15</sup> found the heat of solution of TeCl<sub>4</sub> (c) in water to be  $20.37$ .

**H<sub>2</sub>TeO<sub>3</sub> (c).** Thomsen<sup>15</sup> found the heat of solution of this compound in water to be zero.

**TeO<sub>2</sub> (c).** Thomsen<sup>15</sup> measured the heat of the reaction, (TeO<sub>2</sub> + 4 HCl) (aq.) + 2 SnCl<sub>2</sub> (aq.) = Te (amorp., ppt.) + 2 SnCl<sub>4</sub> (aq.) + 2 H<sub>2</sub>O (liq.), and his data yield, for TeO<sub>2</sub> (c),  $Q_f = 77.6$ . Schuhmann<sup>2</sup> measured the electromotive force at various temperatures of the cell in which the reaction was Te (c, II) + 2 H<sub>2</sub>O (liq.) = TeO<sub>2</sub> (c) + 2 H<sub>2</sub> (g), and his data yield, for TeO<sub>2</sub> (c, II),  $Q_f = 77.58$ . Mixer's<sup>10</sup> data on the reactions of sodium peroxide with Te and TeO<sub>2</sub>, respectively, lead to a value of  $88.7$  for the heat of formation of TeO<sub>2</sub> (c).

**H<sub>2</sub>TeO<sub>4</sub> (aq.).** Thomsen<sup>15</sup> measured the heat of oxidation of aqueous TeO<sub>2</sub> with potassium permanganate, and his data yield, for H<sub>2</sub>TeO<sub>4</sub> (400),  $Q_f = 165.3$ . Berthelot and Fabre<sup>1</sup> oxidized solid tellurium with liquid bromine in the presence of water,  $\text{Te (c)} + 3 \text{Br}_2 \text{ (liq.)} + 4 \text{H}_2\text{O (liq.)} = (\text{H}_2\text{TeO}_4 + 6 \text{HBr}) \text{ (aq.)}$ , and their data yield, for H<sub>2</sub>TeO<sub>4</sub> (aq.),  $Q_f = 169.3$ .

**H<sub>2</sub>TeO<sub>4</sub> · 2 H<sub>2</sub>O (c).** Metzner<sup>1</sup> measured the heat of solution in water.

**SO<sub>2</sub> · 2 TeO<sub>2</sub> (c).** Metzner<sup>1</sup> measured the heat of solution of this compound in aqueous KOH.

**H<sub>2</sub>Te (g).** The data of Berthelot and Fabre<sup>1</sup> on the reaction,  $\text{H}_2\text{Te (g)} + 2 \text{FeCl}_3 \text{ (aq.)} = \text{Te (ppt.)} + (2 \text{FeCl}_2 + 2 \text{HCl}) \text{ (aq.)}$  yield, for H<sub>2</sub>Te (g),  $Q_f = -34.2$ .

**TeBr<sub>4</sub> (c).** Beck<sup>1</sup> found for the reaction of the solid tetrabromide with aqueous sodium acetate,  $Q = 7.05$ ; whence, for TeBr<sub>4</sub> (c),  $Q_f = 49.3$ .

**TeF<sub>6</sub> (g).** Yost and Claussen<sup>1</sup> reported  $Q_f = 315.0$ .

**TeF<sub>6</sub> (c).** Klemm and Henkel<sup>1</sup> gave for the heat of sublimation,  $-5.13^{-28}$ ; Yost and Claussen<sup>1</sup> reported  $-6.74^{-38,9}$ .

**TeF<sub>6</sub> (liq.).** Klemm and Henkel<sup>1</sup> gave for the heat of fusion,  $-1.6$ ; Yost and Claussen<sup>1</sup> estimated  $-1.9$ .

## POLONIUM

**Po (c).** Standard state.

## NITROGEN

**N<sub>2</sub> (g).** The standard state is taken as the equilibrium gas at 18°. The values for the energy states of gaseous diatomic nitrogen are from Sponer,<sup>1,3</sup> Birge and Hopfield,<sup>1,4</sup> and Mulliken.<sup>3,6</sup> See also Jevons.<sup>1</sup> Data on the energy of ionization of N<sub>2</sub> (g) were reported by Sponer,<sup>3</sup> Smyth,<sup>3</sup> Turner and Samson,<sup>1</sup> and Tate, Smith, and Vaughan,<sup>1</sup> the value of the last named being  $15.65 \pm 0.02$  volt-electrons.

**N (g).** The value for the energy of dissociation of normal gaseous N<sub>2</sub> into normal gaseous N atoms is taken from Herzberg and Sponer,<sup>1</sup> Kaplan,<sup>5</sup> and Lozier.<sup>3</sup> Herzberg and Sponer<sup>1</sup> reported the value  $7.34 \pm 0.02$  volt-electrons. See also van der Ziel,<sup>1</sup> Birge,<sup>1,3,8,10</sup> Birge and Hopfield,<sup>1,4</sup> Turner and Samson,<sup>1</sup> Lozier,<sup>1</sup> Hogness and Lunn,<sup>1</sup> Brandt,<sup>1</sup> Duncan,<sup>1</sup> Kneser,<sup>1</sup> Mohler and Foote,<sup>1</sup> and Grimm and Eucken.<sup>1</sup>

The energies of ionization of monatomic nitrogen to various stages are taken from the following works: Hopfield<sup>4</sup> and Compton and Boyce,<sup>1</sup> first step; Bowen<sup>2</sup> and Fowler and Freeman,<sup>1</sup> second step; Bowen,<sup>2</sup> Millikan and Bowen,<sup>3,4</sup> and Freeman,<sup>1</sup> third step; Edlen,<sup>1</sup> fourth step; Edlen and Ericson,<sup>5</sup> fifth step. The values for the sixth and seventh steps are taken from the calculations of Laporte and Young.<sup>1</sup>

**N<sub>2</sub> (liq.).** From a review of the data of Alt,<sup>1</sup> Dana,<sup>1</sup> Eucken,<sup>2,3</sup> Keesom and Houlhoff,<sup>1</sup> Millar and Sullivan,<sup>1</sup> Burnett,<sup>1</sup> Shearer,<sup>1</sup> Rodebush, Andrews, and Taylor,<sup>1</sup> and Mathias, Crommelin, and Onnes,<sup>4</sup> Wiebe and Brevoort<sup>1</sup> deduced  $V = -1.335$  at the boiling point,  $-195.7^\circ$ . Vapor

pressure data were reported by Crommelin,<sup>4</sup> Cath,<sup>1</sup> Mathias, Onnes, and Crommelin,<sup>1</sup> Onnes, Dorsman, and Holst,<sup>1</sup> Wroblewsky,<sup>4</sup> Baly,<sup>1</sup> Fischer and Alt,<sup>1</sup> Holst and Hamburger,<sup>1, 2</sup> Henning and Heuse,<sup>1</sup> Olschewsky,<sup>1, 3, 5, 10, 11</sup> Porter and Perry,<sup>1</sup> and von Siemans.<sup>1</sup>

**N<sub>2</sub> (c).** Eucken<sup>2, 3</sup> measured the heat of fusion of N<sub>2</sub> (c, I) and the heat of transition of N<sub>2</sub> (c, II) to N<sub>2</sub> (c, I). See also Estreicher.<sup>1</sup>

**NH (g).** Bates<sup>1</sup> determined, from spectroscopic data, the energy of dissociation of NH into normal atoms, and the energy of the first electronic state.

**NH<sub>3</sub> (g).** Thomsen<sup>15</sup> and Berthelot<sup>21</sup> measured the heat of combustion of gaseous ammonia, and their data yield, for NH<sub>3</sub> (g),  $Q_f = 11.7$  and  $11.2$ , respectively. Haber,<sup>4</sup> Haber, Tamaru, and Oeholm,<sup>1</sup> Haber and Tamaru,<sup>1</sup> and Tamaru<sup>1</sup> measured the heat of the dissociation, NH<sub>3</sub> (g) =  $\frac{1}{2}$  N<sub>2</sub> (g) +  $\frac{3}{2}$  H<sub>2</sub> (g), at various temperatures. Lewis and Randall<sup>5</sup> reviewed these data, and their equation yields, for NH<sub>3</sub> (g),  $Q_f = 10.97$ . Equilibrium data on the synthesis of gaseous ammonia from nitrogen and hydrogen were obtained by Haber,<sup>3, 4, 5</sup> Haber, Tamaru, and Ponnay,<sup>1</sup> Haber and Maschke,<sup>1</sup> Haber and Greenwood,<sup>1</sup> Haber, Tamaru, and Oeholm,<sup>1</sup> Haber and Moser,<sup>1</sup> Haber and Le Rossignol,<sup>1, 2, 3, 4</sup> Claude,<sup>1</sup> Lebeau and Jost,<sup>1, 2</sup> Nernst,<sup>4</sup> Larson,<sup>1</sup> and Larson and Dodge.<sup>1</sup> See also Haber and van Oordt.<sup>1, 2, 3</sup> Gillespie<sup>1, 4</sup> and Gillespie and Beattie<sup>1, 2, 3</sup> critically reviewed the recent accurate data of Larson<sup>1</sup> and Larson and Dodge,<sup>1</sup> and, after making corrections for the deviations from the ideal gas laws, deduced, for NH<sub>3</sub> (g),  $Q_f = 10.74$ .

**NH<sub>3</sub> (liq.).** The most accurate value for the heat of vaporization of liquid ammonia is that of Osborne and Van Dusen,<sup>1</sup> who found  $V = -5.56$  at the normal boiling point. From this value, we have computed  $V = -5.07$  at 18°. Other data on the heat of vaporization of ammonia are given by Estreicher and Schneer,<sup>1</sup> Holst,<sup>1, 3</sup> de Forcrand and Massol,<sup>1</sup> Henning,<sup>1</sup> Regnault,<sup>3</sup> Strombeck,<sup>1</sup> Franklin and Kraus,<sup>1</sup> Brill,<sup>1</sup> Eucken and Karwat,<sup>1</sup> and Donath.<sup>1</sup>

**NH<sub>3</sub> (c).** By direct calorimetric measurement, Eucken and Karwat<sup>1</sup> and Eucken and Donath<sup>1</sup> found  $F = -1.43$  and  $-1.420$ , respectively, at the freezing point,  $-77.6^\circ$ . From the difference in the heats of solution of the solid and the liquid, Massol<sup>2</sup> (see de Forcrand and Massol<sup>1</sup>) found the heat of fusion of solid ammonia to be  $-1.84$  at  $-75^\circ$ . The values of Eucken and co-workers are in accord with those calculated from the differences in the variation, with temperature, of the logarithm of the vapor pressures of the solid and liquid, respectively, data on which are given for the solid, by Cragoe, Meyers, and Taylor,<sup>1</sup> Karwat,<sup>1</sup> McKelvy and Taylor,<sup>1</sup> Smits and Postma,<sup>1</sup> Briner,<sup>1</sup> Burrell and Robertson,<sup>1, 3</sup> and Mundel,<sup>1</sup> and, for the liquid, by Cragoe, Meyers, and Taylor,<sup>1</sup> Henning and Stock,<sup>1</sup> and others. See also the calculations by Karwat<sup>1</sup> and Rideal.<sup>1</sup>

**NH<sub>3</sub> (aq.).** The data on the heat of solution of gaseous ammonia in water yield the following values: Thomsen,<sup>3, 15</sup>  $8.47_{200}$ ; Berthelot,<sup>21</sup>  $8.82^{10}$ ,  $8.2^{100}$ ; Favre and Silbermann,<sup>3</sup>  $8.75^{15}$ ; Baud and Gay,<sup>1</sup>  $8.55_{200}^{13}$ ;

Wrevski and Savaritski,<sup>1</sup> 8.35<sub>200</sub>. The data of Ramstetter and Hantke<sup>1</sup> show an incorrect trend. The data on the heat of dilution of aqueous ammonia given by Thomsen,<sup>15</sup> Baud and Gay,<sup>1</sup> and Wrevski and Savaritski<sup>1</sup> were reviewed by Bichowsky.<sup>2</sup>

**NH<sub>4</sub>F (aq.).** Guntz<sup>1</sup> found  $N=15.2$ .

**NH<sub>4</sub>F (c).** Guntz<sup>1</sup> quoted a value for the heat of solution obtained by Favre, whose report we have been unable to find. Simon, Simson, and Ruhemann<sup>1</sup> found no transitions in solid ammonium fluoride.

**NH<sub>4</sub>Cl (aq.).** The data on the heat of neutralization of aqueous ammonia with aqueous hydrochloric acid yield the following values for  $N_{200}$ : Hess,<sup>6</sup> —; Berthelot,<sup>4</sup> —; Favre and Silbermann,<sup>3</sup> 13.5; Andrews,<sup>1, 2, 11</sup> 12.96; Thomsen,<sup>15</sup> 12.30; Biltz and Messerknecht,<sup>2</sup> 12.30. Data on the heat of dilution of aqueous ammonium chloride were reported by Pratt,<sup>1</sup> Thomsen,<sup>15</sup> Magie,<sup>1</sup> Stackelberg,<sup>1</sup> Winkelmann,<sup>1</sup> and Lehtonen.<sup>1</sup> We have extrapolated these data to infinite dilution.

**NH<sub>4</sub><sup>+</sup> (aq.).** From the values for NH<sub>4</sub>Cl ( $\infty$ ) and Cl<sup>-</sup> ( $\infty$ ), and NH<sub>4</sub>NO<sub>3</sub> ( $\infty$ ) and NO<sub>3</sub><sup>-</sup> ( $\infty$ ), we have computed, for NH<sub>4</sub><sup>+</sup> ( $\infty$ ),  $Qf=31.455$  and  $31.47$ , respectively.

**NH<sub>4</sub>Cl (c, II).** The existing data yield the following values for the heat of solution of ammonium chloride: Anderson and Noyes,<sup>1</sup>  $-3.86_{200}$ ; Berthelot,<sup>7</sup>  $-4.0$ ; Favre and Silbermann,<sup>3</sup>  $-3.4$ ; Mondain-Monval,<sup>3</sup>  $-3.84^{19}$ ; Winkelmann,<sup>1</sup>  $-3.92_{200}$ ; Colson,<sup>5</sup>  $-3.95_{200}$ ; Stackelberg,<sup>1</sup>  $-3.93_{150}$ ; Van Deventer and van der Stadt,<sup>1</sup>  $-3.88_{200}$ ; Thomsen,<sup>15</sup>  $-3.92_{200}$ . Lehtonen<sup>1</sup> measured the heat of solution at 0°. Raabe<sup>1</sup> measured the heat of the reaction, NH<sub>3</sub> (g) + HCl (g) = NH<sub>4</sub>Cl (c), finding  $Q=44.46$ ; whence, for NH<sub>4</sub>Cl (c),  $Qf=77.4$ . Some error must exist in his data. Bronsted<sup>8</sup> measured the heat of the reaction  $\frac{1}{2}$  H<sub>2</sub> (g) + NH<sub>3</sub> (in sat'd. aq. NH<sub>4</sub>Cl) + HgCl (c) = Hg (liq.) + NH<sub>4</sub>Cl (c, II), finding  $Q=70.60$ ; but we can not use these data to obtain a value for the heat of formation of solid ammonium chloride without a value for the heat of solution of gaseous ammonia in saturated aqueous ammonium chloride.

**NH<sub>4</sub>Cl (c, I).** For the transition at 184°, Scheffer<sup>3, 4</sup> found  $-1.03$ ; Bridgman,<sup>7</sup>  $-0.88$ ; Klinkhardt,<sup>1</sup>  $-0.97$ .

**NH<sub>4</sub>Cl (c, III).** Simon<sup>3</sup> found  $T=-0.356_{11-31}$ . See also Ewald.<sup>1</sup>

**NH<sub>4</sub>Cl (g).** Gutmann,<sup>1</sup> Johnston,<sup>4</sup> Neuberger,<sup>1</sup> Pullinger and Gardner,<sup>1</sup> Ramsay and Young,<sup>1, 4</sup> Deville and Troost,<sup>1</sup> Smith and Lombard,<sup>1, 2</sup> and Rodebush and Michalek<sup>1</sup> obtained data on the dissociation of gaseous ammonium chloride. These data yield for the reaction NH<sub>3</sub> (g) + HCl (g) = NH<sub>4</sub>Cl (g),  $Q=9.4$ ; whence, for NH<sub>4</sub>Cl (g),  $Qf=42.4$ . See also Wegscheider<sup>1</sup> and Smith and Lombard.<sup>1</sup> Because they took special care to reach equilibrium, we have selected the values of Smith and Calvert<sup>1, 2</sup> and Smith and Lombard<sup>1, 2</sup> for the heat of sublimation of solid ammonium chloride, in preference to the values of Braune and Knoke,<sup>1</sup> Rassow,<sup>1</sup> Scheffer,<sup>1</sup> Johnson,<sup>5</sup> Horstman,<sup>1</sup> Ramsay and Young,<sup>1, 4</sup> Smith and Menzies,<sup>1</sup> and Wegscheider.<sup>1, 2</sup> See also Smits<sup>1</sup> and Smits and DeLange.<sup>1</sup>

**NH<sub>4</sub>Br<sub>3</sub> (c).** The data of Hüttig and Schliessmann<sup>1</sup> on the dissociation pressure of solid NH<sub>4</sub>Br<sub>3</sub> at various temperatures, yield  $D = -12.8$ , which value seems high. See also Ephraim.<sup>3</sup>

**NH<sub>4</sub>I (aq.).** The value of  $Q_f$  for this substance is obtained from those for aqueous ammonium and iodide ions.

**NH<sub>4</sub>I (c, I).** The existing data yield the following values for the heat of solution: Thomsen,<sup>15</sup>  $-3.56_{200}$ ; Varet,<sup>2</sup>  $-3.5$ .

**NH<sub>4</sub><sup>+</sup> (g).** Grimm<sup>2</sup> showed that the heat of formation of this substance can be calculated by the method of lattice energies. Using the values given by Sherman<sup>1</sup> for the lattice energies of NH<sub>4</sub>F, NH<sub>4</sub>Cl, NH<sub>4</sub>Br, and NH<sub>4</sub>I, and our values for the other thermal quantities needed, we have computed, for NH<sub>4</sub><sup>+</sup> (g),  $Q_f = 0.0$ ,  $-17.3$ ,  $-21.2$  and  $-42.2$ , respectively. We have selected  $-20$  as the mean of these very discordant results.

**NH<sub>4</sub>Br (aq.).** The heat of formation of aqueous ammonium bromide is computed from the values for NH<sub>4</sub><sup>+</sup> (aq.) and Br<sup>-</sup> (aq.).

**NH<sub>4</sub>Br (c, II).** The data on the heat of solution yield the following values: Thomsen,<sup>15</sup>  $-4.45_{200}$ ; Andre,<sup>1</sup>  $-4.87^5$ .

**NH<sub>4</sub>Br (c, I).** Bridgman<sup>7</sup> determined the heat of transition.

**NH<sub>4</sub>I (c, II).** Bridgman reported  $T = -0.701_{-1}^{-18}$ . See also Simon, Simson, and Ruhemann.<sup>1</sup>

**NH<sub>4</sub>I<sub>3</sub> (c).** Foote and Bradley<sup>1</sup> studied the equilibrium, NH<sub>4</sub>I<sub>3</sub> (c) = NH<sub>4</sub>I (c) + I<sub>2</sub> (g).

**NH<sub>4</sub>ClO<sub>4</sub> (aq.).** Berthelot<sup>79</sup> measured the heat of neutralization.

**NH<sub>4</sub>ClO<sub>4</sub> (c).** Berthelot<sup>79</sup> measured the heat of solution.

**(NH<sub>4</sub>)<sub>2</sub>S (aq.).** Thomsen<sup>15</sup> measured the heat of solution of gaseous H<sub>2</sub>S in aqueous ammonia to form aqueous (NH<sub>4</sub>)<sub>2</sub>S to be 11.10; and Berthelot<sup>14</sup> measured the heat of neutralization of aqueous H<sub>2</sub>S with aqueous ammonia to form aqueous (NH<sub>4</sub>)<sub>2</sub>S to be 6.2<sup>15</sup>. These data yield for (NH<sub>4</sub>)<sub>2</sub>S (aq.),  $Q_f = 55.0$  and  $54.7$ , respectively.

**NH<sub>4</sub>HS (aq.).** Thomsen<sup>15</sup> found  $Q = 0.15$  for the heat of mixing aqueous NH<sub>3</sub> with aqueous NH<sub>4</sub>HS.

**NH<sub>4</sub>HS (c).** Berthelot<sup>14</sup> measured the heat of solution. Vapor pressure data for solid ammonium bisulfide were given by Salet,<sup>1</sup> Isambert,<sup>1, 7, 9</sup> Briner,<sup>1</sup> Magnusson,<sup>1</sup> and Walker and Lumsden.<sup>1</sup> Randall and White<sup>2</sup> reviewed these data and gave for the reaction, NH<sub>4</sub>HS (c) = NH<sub>3</sub> (g) + H<sub>2</sub>S (g),  $Q = -22.24$ , whence, for NH<sub>4</sub>HS (c),  $Q_f = 38.5$ .

**NS (c).** Berthelot and Vielle<sup>3</sup> determined the heat of decomposition to be  $-31.9$ .

**NSe (c).** Berthelot and Vielle<sup>3</sup> determined the heat of decomposition to be  $-42.3$ .

**(NH<sub>4</sub>)<sub>2</sub>S<sub>n</sub> (aq.).** Sabatier<sup>1</sup> measured the heats of reaction with aqueous iodine of (NH<sub>4</sub>)<sub>2</sub>S<sub>4</sub> (aq.), (NH<sub>4</sub>)<sub>2</sub>S<sub>5</sub> (aq.), and (NH<sub>4</sub>)<sub>2</sub>S<sub>8</sub> (aq.), respectively.

**(NH<sub>4</sub>)<sub>2</sub>S<sub>n</sub> (c).** Sabatier<sup>1</sup> measured the heats of solution of (NH<sub>4</sub>)<sub>2</sub>S<sub>4</sub> (c), (NH<sub>4</sub>)<sub>2</sub>S<sub>5</sub> (c), and (NH<sub>4</sub>)<sub>2</sub>S<sub>8</sub> (c).

$(\text{NH}_4)_2\text{SO}_3$  (aq.). de Forcrand<sup>5, 15</sup> measured the heat of neutralization of  $\text{SO}_2$  (aq.) with  $2\text{NH}_3$  (aq.), and the heat of mixing  $\text{NH}_3$  (aq.) with  $\text{NH}_4\text{HSO}_3$  (aq.). His data yield, for  $(\text{NH}_4)_2\text{SO}_3$  (aq.),  $Q_f = 210.8$  and  $210.4$ , respectively.

$(\text{NH}_4)_2\text{SO}_3$  (c). de Forcrand<sup>5, 15</sup> measured the heat of solution.

$(\text{NH}_4)_2\text{SO}_3 \cdot \text{H}_2\text{O}$  (c). For the heat of solution, de Forcrand<sup>5, 15</sup> found  $-5.4^8$  and Hartog<sup>1</sup>  $-4.3$ . de Forcrand's sample was not pure.

$\text{NH}_4\text{HSO}_3$  (aq.). de Forcrand<sup>5, 15</sup> measured the heat of mixing  $\text{SO}_2$  (aq.) with  $\text{NH}_3$  (aq.), finding  $N = 14.78^9$ , whence, for  $\text{NH}_4\text{HSO}_3$  (aq.),  $Q_f = 180.85$ .

$\text{NH}_4\text{HSO}_3$  (c). de Forcrand<sup>5, 15</sup> measured the heat of solution.

$(\text{NH}_4)_2\text{S}_2\text{O}_5$  (aq.). The value for this substance is taken equal to that for  $2\text{NH}_4\text{HSO}_3$  (aq.) minus that for  $\text{H}_2\text{O}$  (liq.).

$(\text{NH}_4)_2\text{SO}_4$  (aq.). The existing data yield the following values for the heat of neutralization of aqueous ammonia with aqueous sulfuric acid: Thomsen,<sup>15</sup>  $28.96_{400}$ ; Berthelot,<sup>4</sup>  $29.0_{400}^{20}$ ; Favre,<sup>8</sup>  $29.8$ ; Bouzat,<sup>1</sup>  $29.05_{400}^{42}$ ; Hess,<sup>1, 2, 3, 4</sup> —; Andrews,<sup>1, 2, 10</sup>  $29.4$ ; Favre and Silbermann,<sup>3</sup>  $29.4$ . See also Roth.<sup>5</sup> The heat of dilution of aqueous ammonium sulfate was measured by Thomsen.<sup>15</sup> See also Roth.<sup>5</sup>

$(\text{NH}_4)_2\text{SO}_4$  (c). The existing data on the heat of solution yield the following values: Thomsen,<sup>15</sup>  $-2.38_{400}$ ; Favre,<sup>8</sup>  $-2.0$ ; Berthelot,<sup>4</sup>  $-2.6$ ; Van Deventer and van der Stadt,<sup>1</sup>  $-2.32_{200}$ ; Roth,<sup>5</sup>  $-2.03_{200}$ . See also Favre and Silbermann.<sup>3</sup>

$\text{NH}_4\text{HSO}_4$  (aq.). Thomsen<sup>15</sup> and Berthelot<sup>4</sup> obtained the same value,  $-1.41$ , for the heat of the reaction,  $\text{H}_2\text{SO}_4$  (200) +  $(\text{NH}_4)_2\text{SO}_4$  (200) =  $2\text{NH}_4\text{HSO}_4$  (200).

$\text{NH}_4\text{HSO}_4$  (c). Thomsen<sup>15</sup> measured the heat of solution.

$(\text{NH}_4)_2\text{S}_2\text{O}_8$  (aq.). The value for this substance is obtained from those for the ions.

$(\text{NH}_4)_2\text{S}_2\text{O}_8$  (c). Berthelot<sup>107</sup> measured the heat of solution.

$\text{NH}_4\text{HSe}$  (aq.). Fabre<sup>1</sup> found, for  $\text{NH}_3$  (aq.) +  $\text{H}_2\text{Se}$  (aq.),  $N = 6.2$ .

$(\text{NH}_4)_2\text{Se}$  (aq.). The value for this substance is obtained from those for the ions.

$\text{NO}$  (g). Berthelot<sup>29, 58</sup> measured the heats of the reactions,  $\frac{1}{2}\text{C}_2\text{N}_2$  (g) +  $\text{O}_2$  (g) =  $\text{CO}_2$  (g) +  $\frac{1}{2}\text{N}_2$  (g) and  $\frac{1}{2}\text{C}_2\text{N}_2$  (g) +  $2\text{NO}$  (g) =  $\text{CO}_2$  (g) +  $\frac{3}{2}\text{N}_2$  (g). The difference gives the heat of the reaction,  $\text{O}_2$  (g) +  $\text{N}_2$  (g) =  $2\text{NO}$  (g), and Berthelot's data yield, for  $\text{NO}$  (g),  $Q_f = -21.85$ . Berthelot's data on similar experiments with ethylene instead of cyanogen yield, for  $\text{NO}$  (g),  $Q_f = -21.6$ . See also Favre and Silbermann<sup>2</sup> and Dulong.<sup>2</sup> The high temperature equilibrium data on the reaction between  $\text{N}_2$  and  $\text{O}_2$  to form  $\text{NO}$ , obtained by Nernst,<sup>2, 3</sup> Finckh,<sup>1</sup> Jellinek,<sup>1</sup> Grau and Russ,<sup>1</sup> Haber and Koenig,<sup>1, 2</sup> and Nuranen,<sup>1</sup> were reviewed by Lewis and Randall<sup>5</sup> and Randall and White,<sup>1</sup> and shown to be consistent with the heat of formation value deduced from Berthelot's data.

$\text{NO}$  (liq.). By direct calorimetric measurement, Johnston and Giauque<sup>1</sup> found  $V = -3.293^{-151.7}$ . Similar data were obtained earlier by

Eucken and Karwat.<sup>1</sup> The vapor pressure data of Goldschmidt,<sup>2</sup> Henglein and Kruger,<sup>1</sup> and Johnston and Giaque<sup>1</sup> are in accord with the latter's direct calorimetric value.

**NO (c).** Johnston and Giaque<sup>1</sup> found  $F = -0.550$ -<sup>163.6</sup>, which value is in accord with the values of the heat of sublimation obtained from the vapor pressure data of Johnston and Giaque,<sup>1</sup> Mundel,<sup>1</sup> Henglein and Kruger,<sup>1</sup> and Goldschmidt.<sup>2</sup>

The values of the energy states of the NO molecule are from Mulliken.<sup>6</sup> See also Jevons.<sup>1</sup>

**N<sub>2</sub>O (g).** The heat of combustion of N<sub>2</sub>O with H<sub>2</sub>, or with CO, was measured by Favre,<sup>1a</sup> Berthelot,<sup>58</sup> Thomsen,<sup>15</sup> Sutton,<sup>1</sup> Awbery and Griffiths,<sup>2</sup> and Fenning and Cotton.<sup>1</sup> Sutton<sup>1</sup> measured in a bomb calorimeter the heat of reaction of N<sub>2</sub>O with H<sub>2</sub>, and his data yield, for N<sub>2</sub>O (g),  $Q_f = 20.4 \pm 0.3$ . Awbery and Griffiths,<sup>2</sup> with a constant pressure flame calorimeter, and Fenning and Cotton,<sup>1</sup> with a bomb calorimeter, measured the heats of the reactions,  $\text{CO (g)} + \frac{1}{2} \text{O}_2 \text{ (g)} = \text{CO}_2 \text{ (g)}$  and  $\text{N}_2\text{O (g)} + \text{CO (g)} = \text{CO}_2 \text{ (g)} + \text{N}_2 \text{ (g)}$ , the difference of which gives the heat of formation of nitrous oxide. Their data yield, for N<sub>2</sub>O (g),  $Q_f = -19.52 \pm 0.22$  and  $-19.74 \pm 0.07$ , respectively.

**N<sub>2</sub>O (liq.), N<sub>2</sub>O(c).** The heats of vaporization and fusion are evaluated from the data of Eucken and Donath,<sup>1</sup> Cailletet and Mathias,<sup>1</sup> Young,<sup>2</sup> Burrell and Robertson,<sup>3</sup> Bergstrom,<sup>2, 3</sup> Regnault,<sup>7</sup> Cardoso and Arni,<sup>1</sup> Grunmach,<sup>1</sup> Villard,<sup>1, 3, 9</sup> Kuenen,<sup>1</sup> Ramsay and Shield,<sup>1</sup> Pictet,<sup>1</sup> Hunter,<sup>1</sup> Dewar,<sup>2</sup> Faraday,<sup>1, 3</sup> Britton,<sup>1</sup> Cailletet and Colardeau,<sup>1</sup> Marshall and Ramsay,<sup>1</sup> Mathias,<sup>1, 2</sup> and Mills.<sup>1</sup>

**N<sub>2</sub>O (aq.).** Villard<sup>1, 2, 3, 4, 9, 10</sup> measured the heat of solution of the gas in water at 0°.

**N<sub>2</sub>O·6 H<sub>2</sub>O (c).** The equilibrium data of Tamman and Krige<sup>1</sup> and Villard<sup>1, 2, 3, 4, 9, 10</sup> yield for the heat of decomposition of this hydrate (concerning whose composition there is some question)  $-15.0$  per mole of gas. Villard's data yield  $8.4$  for the heat of formation of N<sub>2</sub>O·6 H<sub>2</sub>O (c) from aqueous N<sub>2</sub>O and liquid H<sub>2</sub>O.

**NO<sub>2</sub> (g).** Randall and White<sup>1</sup> reviewed the equilibrium data of Bodenstein,<sup>5</sup> Colson,<sup>3</sup> Schreber,<sup>1</sup> Russ,<sup>1</sup> Scheffer and Treub,<sup>1</sup> and Bodenstein and Katayama<sup>1</sup> on the reaction,  $\text{NO (g)} + \frac{1}{2} \text{O}_2 \text{ (g)} = \text{NO}_2 \text{ (g)}$ , and concluded that  $Q = 13.57$ ; whence, for NO<sub>2</sub> (g),  $Q_f = -8.03$ .

**N<sub>2</sub>O<sub>4</sub> (g).** Randall and White<sup>1</sup> reviewed the equilibrium data (obtained from vapor densities) of Mittasch, Kuss, and Schlueter,<sup>1</sup> Scheffer and Treub,<sup>2</sup> Wourtzell,<sup>1</sup> Schreber,<sup>1</sup> Bodenstein,<sup>5</sup> Richardson,<sup>2</sup> and Deville and Troost<sup>3</sup> on the reaction,  $2 \text{NO}_2 \text{ (g)} = \text{N}_2\text{O}_4 \text{ (g)}$ , and concluded that  $Q = 13.00$ . Bodenstein<sup>5</sup> gave  $13.88$ ; Wourtzell,<sup>1</sup>  $13.43$ . Using the value  $13.00$  we have computed, for N<sub>2</sub>O<sub>4</sub> (g),  $Q_f = -3.06$ . The data of Thomsen<sup>15</sup> and Berthelot,<sup>28</sup> who each measured the heat of the reaction,  $2 \text{NO (g)} + \text{O}_2 \text{ (g)} = \text{N}_2\text{O}_4 \text{ (g)}$ , yield, for N<sub>2</sub>O<sub>4</sub> (g),  $Q_f = -4.06$  and  $-4.40$ , respectively.

**N<sub>2</sub>O<sub>4</sub> (liq.).** Berthelot and Ogier<sup>5</sup> measured the heat of condensation

of gaseous  $\text{N}_2\text{O}_4$  to be 8.6 at  $25^\circ$ . The vapor pressure data of Mittasch, Kuss, and Schlueter,<sup>1</sup> Scheffer and Treub,<sup>2</sup> Guye and Drouginine,<sup>1</sup> and Russ<sup>1</sup> yield  $-9.2$  for the heat of vaporization of liquid  $\text{N}_2\text{O}_4$  at  $18^\circ$ .

$\text{N}_2\text{O}_4$  (c). By direct measurement, Ramsay<sup>2</sup> found  $F = -2.96$ <sup>-10</sup>, while data on the freezing point lowering yield  $-3.10$ . These values are in accord with the heat of sublimation calculated by Russ.<sup>1</sup> See also Egerton.<sup>1</sup>

$\text{N}_2\text{O}_3$  (g). This unstable gas exists in equilibrium mixtures with NO and  $\text{N}_2\text{O}_4$ . The equilibrium data of Abel and Proisl<sup>1</sup> on the reactions,  $2 \text{NO} (\text{g}) + \text{N}_2\text{O}_4 (\text{g}) = 2 \text{N}_2\text{O}_3 (\text{g})$  and  $\text{NO} (\text{g}) + \text{NO}_2 (\text{g}) = \text{N}_2\text{O}_3 (\text{g})$ , yield  $Q = 5.6$  and  $9.6$ , respectively; whence, for  $\text{N}_2\text{O}_3 (\text{g})$ ,  $Q_f = -20.3$  and  $-20.0$ .

$\text{N}_2\text{O}_3$  (liq.). The vapor pressure data of Guye and Drouginine<sup>1</sup> yield  $V = -9.40$ <sup>20</sup>, which indicates partial dissociation of the vapor.

$\text{HNO}_2$  (aq.). Thomsen<sup>13, 15</sup> measured the heat of solution in water of gaseous  $\text{N}_2\text{O}_4$  and the heat of reaction of aqueous  $\text{N}_2\text{O}_4$  with gaseous  $\text{Cl}_2$ . If aqueous  $\text{N}_2\text{O}_4$  is equivalent to an aqueous mixture of nitrous and nitric acids, then one may write  $\text{N}_2\text{O}_4 (\text{g}) + \text{H}_2\text{O} (\text{liq.}) = (\text{HNO}_2 + \text{HNO}_3) (\text{aq.})$ , and  $(\text{HNO}_2 + \text{HNO}_3) (\text{aq.}) + \text{H}_2\text{O} (\text{liq.}) + \text{Cl}_2 (\text{g}) = (2 \text{HNO}_3 + 2 \text{HCl}) (\text{aq.})$ . Neglecting the heats of mixing, and subtracting the second equation from the first, one obtains  $\text{N}_2\text{O}_4 (\text{g}) + 2 \text{HCl} (\text{aq.}) = 2 \text{HNO}_2 (\text{aq.}) + \text{Cl}_2 (\text{g})$ . Thomsen's data on these two reactions yield, for  $\text{HNO}_2 (\text{aq.})$ ,  $Q_f = 31.4$ . Klemenc and Hayek<sup>1, 2</sup> obtained data on the equilibrium  $3 \text{HNO}_2 (\text{aq.}) = \text{HNO}_3 (\text{aq.}) + 2 \text{NO} (\text{g}) + \text{H}_2\text{O} (\text{liq.})$ , and computed  $Q = -10.72$ . Combination of this value with Thomsen's data on the reaction of gaseous  $\text{Cl}_2$  with aqueous  $\text{N}_2\text{O}_4$  (see above) yields, for  $\text{HNO}_2 (\text{aq.})$   $Q_f = 28.45$ .

Berthelot<sup>28</sup> measured the heat of the reaction between gaseous nitric oxide, oxygen, and aqueous barium hydroxide, and assumed that only nitrite was formed:  $2 \text{NO} (\text{g}) + \frac{1}{2} \text{O}_2 (\text{g}) + \text{Ba} (\text{OH})_2 (\text{aq.}) = \text{Ba} (\text{NO}_2)_2 (\text{aq.}) + \text{H}_2\text{O} (\text{liq.})$ . Berthelot<sup>28</sup> also measured the heat of the reaction  $\text{Ba} (\text{NO}_2)_2 (\text{aq.}) + \text{H}_2\text{SO}_4 (\text{aq.}) = 2 \text{HNO}_2 (\text{aq.}) + \text{BaSO}_4 (\text{c.})$ . Combination of these equations with our value for the heat of neutralization of aqueous  $\text{Ba} (\text{OH})_2$  with aqueous sulfuric acid gives  $2 \text{NO} (\text{g}) + \frac{1}{2} \text{O}_2 (\text{g}) + \text{H}_2\text{O} (\text{liq.}) = 2 \text{HNO}_2 (\text{aq.})$ . And from these data, we have computed, for  $\text{HNO}_2 (\text{aq.})$ ,  $Q_f = 30.0$ . Berthelot's<sup>28</sup> data on the reaction between gaseous chlorine and aqueous barium nitrite yield, for  $\text{HNO}_2 (\text{aq.})$ ,  $Q_f = 28.3$ . Berthelot<sup>28</sup> measured the heat of mixing solid  $\text{BaO}_2$  with aqueous hydrochloric acid, and the heat of mixing the resultant solution with aqueous barium nitrite. These data yield, for  $\text{HNO}_2 (\text{aq.})$   $Q_f = 27.8$ . Berthelot's data on the reaction between aqueous potassium permanganate and an aqueous nitrite solution yield, for  $\text{HNO}_2 (\text{aq.})$ ,  $Q_f = 28.4$ . These three foregoing values for aqueous nitrous acid depend upon the accuracy of Thomsen's value for the reaction between gaseous chlorine and aqueous  $\text{N}_2\text{O}_4$  (see above).

Both Berthelot<sup>28</sup> and Thomsen<sup>13, 15</sup> measured the heat of the reaction

of decomposing ammonium nitrite, but because the former employed only a small amount of ammonium nitrite and used less refined apparatus, we have used only Thomsen's data. Thomsen apparently measured the heat of the reaction  $(\text{NH}_4\text{NO}_2 + 2.8 \text{ H}_2\text{O}) (\text{liq.}) = \text{N}_2 (\text{g}) + 2.8 \text{ H}_2\text{O} (\text{liq.})$ . We have carefully reviewed his data on this reaction, and utilizing Thomsen's value for the heat of solution of solid ammonium nitrite in  $2.8 \text{ H}_2\text{O}$ , we have computed  $Q = 72.04$  for the reaction  $\text{NH}_4\text{NO}_2 (\text{c}) = \text{N}_2 (\text{g}) + 2 \text{ H}_2\text{O} (\text{liq.})$ . With this we have combined the heat of solution of ammonium nitrite in  $200 \text{ H}_2\text{O}$  and the heat of ionization of  $\text{HNO}_2$ , and have obtained, for  $\text{HNO}_2 (\text{aq.})$ ,  $Q_f = 31.6$ , which is in marked disagreement with the values obtained above.

Swietoslawski<sup>6</sup> measured the heats of the reactions,  $((\text{NH}_2)_2\text{CO} + 2 \text{ HCl}) (\text{aq.}) + 2 \text{ NaNO}_2 (\text{aq.}) = \text{CO}_2 (\text{g}) + \text{N}_2 (\text{g}) + 3 \text{ H}_2\text{O} (\text{liq.}) + 2 \text{ NaCl} (\text{aq.})$  and  $(\text{NH}_2)_2\text{CO} (\text{aq.}) + 2 \text{ HCl} (\text{aq.}) = ((\text{NH}_2)_2\text{CO} + 2 \text{ HCl}) (\text{aq.})$ , finding, respectively,  $Q = 172.6$  and  $0.37$ . Combining with these data, the heat of combustion and of solution of urea and the heat of mixing aqueous sodium nitrite with aqueous hydrochloric acid, we have computed, for  $\text{HNO}_2 (\text{aq.})$ ,  $Q_f = 28.9$ . Swietoslawski<sup>6</sup> also measured the heat of the reaction  $(\text{CH}_3)_2\text{NC}_6\text{H}_5 (\text{liq.}) + \text{HNO}_2 (\text{aq.}) = \text{H}_2\text{O} (\text{liq.}) + \text{NOC}_6\text{H}_4\text{N} (\text{CH}_3)_2 (\text{liq.})$ . Utilizing Swietoslawski's own values for the heats of combustion of these two organic liquids, we have computed, for  $\text{HNO}_2 (\text{aq.})$ ,  $Q_f = 28.4$ . This value can not be given great weight as it is a small difference between large numbers, but nevertheless it is in gratifying agreement with the previous values.

As the best value for the heat of formation of aqueous nitrous acid we have selected the value  $28.5$ , which is consistent with the above available data and with the value for aqueous nitric acid.

$\text{NO}_2^- (\text{aq.})$ . The data of Klemenc and Hayek<sup>1</sup> on the conductivity of aqueous  $\text{HNO}_2$  yield, for  $\text{H}^+ (\text{aq.}) + \text{NO}_2^- (\text{aq.}) = \text{HNO}_2 (\text{aq.})$ ,  $Q^6 = 4.48$ , or  $Q = 4.0$  at  $18^\circ$ ; whence for  $\text{NO}_2^- (\text{aq.})$ ,  $Q_f = 24.5$ . Swietoslawski<sup>6</sup> found, for  $\text{NaNO}_2 (\text{aq.}) + \text{HCl} (\text{aq.}) = (\text{HNO}_2 + \text{NaCl}) (\text{aq.})$ ,  $Q = 3.45$ ; whence for  $\text{NO}_2^- (\text{aq.})$ ,  $Q_f = 25.0$ . From the value for  $\text{NH}_4\text{NO}_2 (\text{aq.})$ , we have deduced, for  $\text{NO}_2^- (\text{aq.})$ ,  $Q_f = 25.4$ .

$\text{HNO}_3 (\text{aq.})$ . Thomsen<sup>15</sup> measured the heats of the reactions  $\text{N}_2\text{O}_4 (\text{g}) = \text{N}_2\text{O}_4 (\text{aq.})$  and  $5 \text{ N}_2\text{O}_4 (\text{aq.}) + 2 \text{ KMnO}_4 (\text{aq.}) + 2 \text{ H}_2\text{O} (\text{liq.}) = (2 \text{ Mn}(\text{NO}_3)_2 + 2 \text{ KNO}_3 + 4 \text{ HNO}_3) (\text{aq.})$ . Neglecting the heats of mixing, his data yield, for  $\text{HNO}_3 (\text{aq.})$ ,  $Q_f = 48.9$ . Thomsen<sup>15</sup> also measured the heat of reaction between aqueous  $\text{N}_2\text{O}_4$  and gaseous chlorine, and his data yield, for  $\text{HNO}_3 (200)$ ,  $Q_f = 49.41$ . Berthelot<sup>28</sup> measured the heat of reaction between liquid  $\text{N}_2\text{O}_4$ , gaseous chlorine, and water, and his data yield, for  $\text{HNO}_3 (\text{aq.})$ ,  $Q_f = 47.9$ . Latimer and Ahlberg<sup>1</sup> calculated the entropy of aqueous  $(\text{M}^+ + \text{NO}_3^-)$ , in a hypothetical 1 molal solution, from data on the entropy of the solid  $\text{MNO}_3$  (calculated from data on the heat capacity down to about  $-261^\circ$ ) and its heat and free energy of solution. Combination of the value of the entropy of aqueous  $(\text{M}^+ + \text{NO}_3^-)$  with similar values for aqueous  $(\text{M}^+ + \text{Cl}^-)$  and aqueous  $(\text{H}^+ + \text{Cl}^-)$  gave the

entropy of aqueous ( $\text{H}^+ + \text{NO}_3^-$ ). They combined this value with the entropies of hydrogen, nitrogen, and oxygen in their standard states, and computed the entropy of formation of aqueous ( $\text{H}^+ + \text{NO}_3^-$ ). Combination of this last value with the value for the free energy of formation given by Lewis and Randall<sup>5</sup> yields, for  $\text{HNO}_3$  (aq.),  $Q_f = 48.7$ . As the best value for the heat of formation of  $\text{HNO}_3$  (200), we have selected the value 49.1, which seems to be most consistent with the above data and with the reactions involving nitrous acid.

Data on the heat of dilution of aqueous nitric acid were obtained by Thomsen,<sup>15</sup> Berthelot,<sup>17</sup> Richards and Rowe,<sup>2</sup> Naudé,<sup>2</sup> Wrewskii and Faerman,<sup>1</sup> Berthelot,<sup>9</sup> and Petersen.<sup>6</sup> Bose<sup>2</sup> reviewed these data. Recently Rossini<sup>3</sup> utilized the accurate measurements of Richards and Rowe<sup>2</sup> to obtain values from 25 to  $\infty$   $\text{H}_2\text{O}$ . We have utilized Thomsen's<sup>15</sup> values in the range 0 to 25  $\text{H}_2\text{O}$ .

**$\text{HNO}_3$  (liq.).** For the heat of solution of liquid  $\text{HNO}_3$  in water Thomsen<sup>15</sup> found 7.44<sub>300</sub> and Berthelot<sup>17</sup> 7.14.

**$\text{HNO}_3$  (c).** Berthelot<sup>17</sup> found the heat of fusion to be  $-0.60$  at  $-47^\circ$ .

**$\text{HNO}_3$  (g).** Berthelot<sup>17</sup> gave  $-7.2$  for the heat of vaporization of the liquid, obtained from data on the heats of solution of the gas and the liquid in water.

**$\text{HNO}_3$  ( $\text{C}_2\text{H}_5\text{OC}_2\text{H}_5$ ).** Hantzsch<sup>1</sup> measured the heat of solution in ether.

**$\text{NH}_4\text{NO}_2$  (aq.).** For the heat of neutralization of aqueous ammonia with aqueous nitrous acid, Berthelot<sup>28</sup> gave the value 9.1 at  $12.5^\circ$ , which he deduced from the heat of the reaction between aqueous ammonium sulfate and aqueous barium nitrite, for which no value was given. The foregoing value yields, for  $\text{NH}_4\text{NO}_2$  (aq.),  $Q_f = 56.9$ .

**$\text{NH}_4\text{NO}_2$  (c).** Berthelot<sup>28</sup> measured the heat of solution to be  $-4.75_{430}^{12.5}$ , from which we have estimated  $-4.66_{200}$  at  $18^\circ$ .

**$\text{H}_2\text{N}_2\text{O}_2$  (aq.).** Berthelot<sup>105</sup> measured the heat of solution of  $\text{CaN}_2\text{O}_2 \cdot 4\text{H}_2\text{O}$  (c) in bromine water and hydrochloric acid, respectively, and the difference of these two reactions leads to the reaction  $\text{H}_2\text{N}_2\text{O}_2$  (aq.)  $+ 4\text{H}_2\text{O}$  (liq.)  $+ 4\text{Br}_2$  (liq.)  $= (2\text{HNO}_3 + 8\text{HBr})$  (aq.), with  $Q = 45.6$ . Similar experiments with the strontium salt gave  $Q = 46.4$ . From the average of these values, we have computed, for  $\text{H}_2\text{N}_2\text{O}_2$  (aq.),  $Q_f = 8.4$ .

**$\text{N}_2\text{O}_2^-$  (aq.).** Berthelot<sup>105</sup> reported the heat of neutralization of the weak hyponitrous acid to be 15.6; whence we have computed, for  $\text{N}_2\text{O}_2^-$  (aq.),  $Q_f = -3.5$ .

**$\text{N}_2\text{O}_5$  (c).** Berthelot<sup>9</sup> found  $S = 16.7$ .

**$\text{N}_2\text{O}_5$  (liq.).** Berthelot<sup>9</sup> reported  $S = 25.0$ , but his sample must have contained water as liquid nitrogen pentoxide is not stable under his conditions. Berl and Saenger<sup>1</sup> measured the heat of solution of fuming nitric acid.

**$\text{N}_2\text{O}_5$  (g).** Berthelot<sup>9</sup> reported the heat of sublimation of solid nitrogen pentoxide to be  $-13.2$ . The vapor pressure data of Daniels and Bright<sup>1</sup> yield  $-13.8$ .

$\text{NO}_3$  (g). Schumacker and Sprenger<sup>1</sup> deduced, for  $\text{NO}_3$  (g),  $Q_f = -13$ , from activation energies of the monomolecular dissociation of gaseous  $\text{N}_2\text{O}_5$ , which is supposed to give gaseous  $\text{NO}_3$ .

$\text{NH}_4\text{NO}_3$  (aq.). The heat of neutralization of aqueous ammonia with aqueous nitric acid was measured by Hess,<sup>8</sup> Andrews,<sup>1, 2, 11</sup> Favre and Silbermann,<sup>3</sup> Favre,<sup>3</sup> Bouzat,<sup>1</sup> Berthelot,<sup>3, 4</sup> and Thomsen.<sup>15</sup> Thomsen's data are the most reliable, and yield  $N = 12.40_{200}$ . Data on the heat of dilution of aqueous ammonium nitrate were obtained by Pratt,<sup>1</sup> Jirsa and Diamant,<sup>1</sup> Thomsen,<sup>15</sup> Tollinger,<sup>1</sup> Dunnington and Hoggard,<sup>1</sup> Mondain-Monval,<sup>2, 3</sup> Lerner-Steinberg,<sup>1</sup> Rümelin,<sup>1</sup> Winkelmann,<sup>1</sup> and Fricke and Havestadt.<sup>1</sup> We have extrapolated the data to infinite dilution.

$\text{NH}_4\text{NO}_3$  (c, IV). The existing data on the heat of solution of ammonium nitrate in water are: Thomsen,<sup>15</sup>  $-6.32_{200}$ ; van Deventer and van der Stadt,<sup>1</sup>  $-6.3$ ; Favre and Silbermann,<sup>3</sup>  $-5.3$ ; Berthelot,<sup>131</sup>  $-4.75_{400}$ .<sup>12</sup> See also Graham<sup>3</sup> and Mondain-Monval.<sup>3</sup> Cohen and Helder-mann<sup>4</sup> reported values for concentrated solutions at  $32.5^\circ$ .

$\text{NH}_4\text{NO}_3$  (c, V). Bridgman<sup>6a</sup> reported  $T = -0.13_{\text{IV}}^{-18}$ .

$\text{NH}_4\text{NO}_3$  (c, III). For the heat of transition of this crystalline form to  $\text{NH}_4\text{NO}_3$  (c, IV), at  $32.2^\circ$ , Bridgman<sup>6a</sup> gave  $0.372$ ; Cohen and Helder-mann,  $0.399$ ; Bellati and Romanese,<sup>4</sup>  $0.403$ ; Mondain-Monval,<sup>2</sup>  $0.40$ .

$\text{NH}_4\text{NO}_3$  (c, II). For the heat of transition of  $\text{NH}_4\text{NO}_3$  (c, II) to  $\text{NH}_4\text{NO}_3$  (c, III), Bridgman<sup>6a</sup> gave  $0.32^{83}$ ; Steiner and Johnston,<sup>1</sup>  $0.31^{84}$ .

$\text{NH}_4\text{NO}_3$  (c, I). For the transition of this form to  $\text{NH}_4\text{NO}_3$  (c, II), Bridgman<sup>6a</sup> gave  $1.02^{125}$ ; Steiner and Johnston,<sup>1</sup>  $0.98^{129}$ . See also Atlas Powder Co.<sup>1</sup>

$\text{NOCl}$  (g). Briner and Pylkoff<sup>1</sup> (see also Briner<sup>2</sup>) measured the heat of the reaction,  $\text{NOCl}$  (g) +  $2\text{KOH}$  (aq.) =  $(\text{KCl} + \text{KNO}_2)$  (aq.) +  $\text{H}_2\text{O}$  (liq.), finding  $Q = 32.0$ . The later and apparently more accurate measurements of Trautz and Wackenheim<sup>1</sup> on the similar reaction with aqueous sodium hydroxide yield  $Q = 37.1$ . These data yield respectively, for  $\text{NOCl}$  (g),  $Q_f = -7.7$  and  $-13.0$ . Lewis and Randall<sup>5</sup> reviewed the data of Sudborough and Miller,<sup>1</sup> Trautz,<sup>3</sup> Vago,<sup>1</sup> Trautz and Hinck,<sup>1, 2</sup> and Trautz and Wackenheim<sup>1</sup> on the equilibrium,  $\text{NO}$  (g) +  $\frac{1}{2}\text{Cl}_2$  (g) =  $\text{NOCl}$  (g), and deduced for this reaction  $Q = 9.1$ ; whence, for  $\text{NOCl}$  (g),  $Q_f = -12.5$ . The recent equilibrium data of Dixon<sup>1</sup> on the same reaction yield  $Q = 9.3$ , whence, for  $\text{NOCl}$  (g),  $Q_f = -12.3$ . Trautz and Wackenheim<sup>1</sup> estimated for this reaction  $Q = 8.7$ , whence, for  $\text{NOCl}$  (g),  $Q_f = -12.9$ . See also Trautz and Schleiter.<sup>1</sup>

$\text{NOCl}$  (liq.). The vapor pressure data of Trautz and Gerwig<sup>1</sup> and Briner and Pylkoff<sup>1</sup> yield for the heat of vaporization  $-6.1$  at about  $-15^\circ$ .

$\text{NOBr}$  (liq.). The data of Trautz and Dalal<sup>1</sup> on the heat of solution of liquid  $\text{NOBr}$  in aqueous  $\text{KOH}$  yield, for  $\text{NOBr}$  (liq.),  $Q_f = -11.6$ .

$\text{NOBr}$  (g). We have estimated the heat of vaporization of the liquid to be  $-6.1$ , whence, for  $\text{NOBr}$  (g),  $Q_f = -17.7$ . The data of Trautz and Dalal<sup>1</sup> on the equilibrium,  $\text{NOBr}$  (g) =  $\text{NO}$  (g) +  $\frac{1}{2}\text{Br}_2$  (g), are not very

consistent, but from them we have estimated for this reaction  $Q=8$  to 9; whence, for  $\text{NOBr (g)}$ ,  $Q_f=-16.4$  to  $-17.4$ .

**$\text{NOBr}_3$  (liq.).** The data of Trautz and Dalal<sup>1</sup> on the heat of solution of liquid  $\text{NOBr}_3$  in aqueous  $\text{KOH}$  yield, for  $\text{NOBr}_3$  (liq.),  $Q_f=1.7$ .

**$\text{NOBr}_3$  (g).** We have estimated the heat of vaporization of the liquid.

**$\text{NH}_2\text{OH} \cdot \text{HNO}_3$  (c).** Berthelot and Andre<sup>2</sup> measured the heat of combustion of this substance in a bomb calorimeter, using naphthalene as an auxiliary combustible material. Correcting the heat of combustion of naphthalene to the modern value, we have computed for  $\text{NH}_2\text{OH} \cdot \text{HNO}_3$  (c),  $Q_f=85.8$ . Berthelot and Andre<sup>2</sup> measured the heat of solution of solid  $\text{NH}_2\text{OH} \cdot \text{HNO}_3$  in water to be  $-5.93_{500}$ . Using the value 81 (see following) for  $\text{NH}_2\text{OH} \cdot \text{HNO}_3$  (aq.), this gives for the solid,  $Q_f=86.9$ .

**$\text{NH}_2\text{OH} \cdot \text{HNO}_3$  (aq.).** Thomsen<sup>15</sup> measured the heat of the reaction,  $(\text{NH}_2\text{OH} \cdot \text{HNO}_3 + 6 \text{AgNO}_3)$  (aq.)  $+ 10 \text{NH}_3$  (aq.)  $= \text{N}_2$  (g)  $+ \text{N}_2\text{O}$  (g)  $+ 3 \text{H}_2\text{O}$  (liq.)  $+ 6 \text{Ag}$  (c)  $+ 10 \text{NH}_4\text{NO}_3$  (aq.). Correcting Thomsen's data for the dissolved  $\text{N}_2$  and  $\text{N}_2\text{O}$ , one finds  $Q=330.43$ , whence, for  $\text{NH}_2\text{OH} \cdot \text{HNO}_3$  (aq.),  $Q_f=82.2$ .

**$\text{NH}_2\text{OH} \cdot \text{HCl}$  (c).** Swietoslawski<sup>4</sup> measured the heat of reaction,  $\text{NH}_2\text{OH} \cdot \text{HCl}$  (c)  $+ \text{NaNO}_2$  (aq.)  $= 2\text{H}_2\text{O}$  (liq.)  $+ \text{N}_2\text{O}$  (g)  $+ \text{NaCl}$  (aq.), to be 65.8, whence, for  $\text{NH}_2\text{OH} \cdot \text{HCl}$  (c),  $Q_f=74.2$ .

**$\text{NH}_2\text{OH} \cdot \text{HCl}$  (aq.).** Berthelot and Matignon<sup>4</sup> measured the heat of solution of the solid to be  $-3.31_{450}^{24}$ . Thomsen<sup>15</sup> found  $-3.65_{200}$ . Combination with the preceding value gives, for  $\text{NH}_2\text{OH} \cdot \text{HCl}$  (aq.),  $Q_f=70.9$  and 70.5, respectively.

**$\text{NH}_2\text{OH} \cdot \text{H}^+$  (aq.).** From the values for aqueous  $\text{NH}_2\text{OH} \cdot \text{HNO}_3$  and  $\text{NH}_2\text{OH} \cdot \text{HCl}$ , one finds, for  $\text{NH}_2\text{OH} \cdot \text{H}^+$  (aq.),  $Q_f=32.3$  and 31.2.

**$\text{NH}_2\text{OH}$  (aq.).** Berthelot's<sup>41</sup> data on the reaction between  $\text{NH}_2\text{OH}$  and  $\text{KOH}$  for which he gives few details, yield, for  $\text{NH}_2\text{OH}$  (aq.),  $Q_f=17.7$ . For the heat of neutralization of  $\text{NH}_2\text{OH}$  (aq.) with  $\text{HCl}$  (aq.), Thomsen<sup>15</sup> gave  $9.26_{200}$ ; Ellingson,<sup>1</sup>  $9.48_{100}$ ,  $9.29_{400}$ ; Berthelot,<sup>41</sup>  $9.2^{24}$ . Using Thomsen's values, we have computed, for  $\text{NH}_2\text{OH}$  (aq.),  $Q_f=21.7$ .

**$\text{NH}_2\text{OH}$  (c).** Berthelot and Matignon<sup>4</sup> found  $S=-3.8$ .

**$(\text{NH}_2\text{OH})_2 \cdot \text{H}_2\text{SO}_4$  (aq.).** Berthelot<sup>41</sup> measured the heat of mixing  $2\text{NH}_2\text{OH}$  (aq.) with  $\text{H}_2\text{SO}_4$  (aq.) to be 21.6 at  $13^\circ$ . Thomsen<sup>15</sup> found for the reaction,  $\text{Ba}(\text{OH})_2(400) + (\text{NH}_2\text{OH})_2 \cdot \text{H}_2\text{SO}_4(600) = \text{BaSO}_4$  (c)  $+ 2\text{H}_2\text{O}$  (liq.)  $+ 2\text{NH}_2\text{OH}$  (500),  $Q=15.32$ . From these data we have computed, for  $(\text{NH}_2\text{OH})_2 \cdot \text{H}_2\text{SO}_4$  (aq.),  $Q_f=276.5$  and 276.7, respectively.

**$\text{NH}_2\text{OH} \cdot \text{H}_2\text{SO}_4$  (aq.).** Ellingson<sup>1</sup> found for the reaction,  $\text{NH}_2\text{OH}$  (aq.)  $+ \text{H}_2\text{SO}_4$  (aq.)  $= \text{NH}_2\text{OH} \cdot \text{H}_2\text{SO}_4$  (aq.),  $Q=11.45_{100}$  and  $11.07_{400}$ . From these data we have computed, for  $\text{NH}_2\text{OH} \cdot \text{H}_2\text{SO}_4$  (aq.),  $Q_f=244.3$ .

**$(\text{NH}_2\text{OH})_2 \cdot \text{H}_2\text{SO}_4$  (c).** Berthelot<sup>41</sup> found  $S=-5.80_{900}^{13}$ .

**$\text{NH}_2\text{OH} \cdot \text{H}_2\text{SO}_4$  (c).** Thomsen<sup>15</sup> found  $S=-0.96$ .

**$\text{N}_2\text{H}_4 \cdot \text{H}_2\text{SO}_4$  (c).** Berthelot and Matignon<sup>3</sup> measured the heat of combustion of hydrazine sulfate with camphor as the auxiliary combustible

substance. Correcting, as does Berthelot,<sup>108</sup> for the new values for the heat of combustion of camphor, we have computed, for  $\text{N}_2\text{H}_4 \cdot \text{H}_2\text{SO}_4$  (c),  $Q_f = 228.4$ .

$\text{N}_2\text{H}_4 \cdot \text{H}_2\text{SO}_4$  (aq.). Berthelot<sup>108</sup> found for the heat of solution of the solid in water,  $-8.7_{2000}^{11}$ ; Bach<sup>1</sup> found  $-8.52_{1200}^{19}$ .

$\text{N}_2\text{H}_4$  (aq.). For the heat of mixing  $\text{N}_2\text{H}_4$  (aq.) with  $\text{H}_2\text{SO}_4$  (aq.), Bach<sup>1</sup> found 11.29. For the reaction between  $\text{Ba}(\text{OH})_2$  (aq.) and  $\text{N}_2\text{H}_4 \cdot \text{H}_2\text{SO}_4$  (aq.), Berthelot<sup>108</sup> found  $Q = 25.7$ . For the similar reaction with  $\text{BaCl}_2$  (aq.), Bach found  $Q = 7.48$ . These data yield, for  $\text{N}_2\text{H}_4$  (aq.),  $Q_f = -3.25$ . Jirsa<sup>1</sup> measured the heat of oxidation of hydrazine with silver oxide,  $\text{N}_2\text{H}_4$  (aq.) +  $2\text{Ag}_2\text{O}$  (c) =  $4\text{Ag}$  (c) +  $\text{N}_2$  (g) +  $2\text{H}_2\text{O}$  (liq.), finding  $Q = 118.5$ . Hence, for  $\text{N}_2\text{H}_4$  (aq.),  $Q_f = -4.5$ . Bach<sup>1</sup> measured the heat of the reaction,  $3\text{N}_2\text{H}_4 \cdot \text{HCl}$  (aq.) +  $2\text{K}_2\text{Cr}_2\text{O}_7$  (aq.) +  $13\text{HCl}$  (aq.) =  $3\text{N}_2$  (g) +  $14\text{H}_2\text{O}$  (liq.) +  $(4\text{KCl} + 4\text{CrCl}_3)$  (aq.), to be 465.2. Combining with this reaction Bach's<sup>1</sup> value for the reaction,  $\text{N}_2\text{H}_4$  (aq.) +  $\text{HCl}$  (aq.) =  $\text{N}_2\text{H}_4 \cdot \text{HCl}$  (aq.),  $Q = 9.60$ , yields, for  $\text{N}_2\text{H}_4$  (aq.),  $Q_f = -5.8$ . Bach<sup>1</sup> also claimed to have measured the heat of the extraordinary reaction,  $6\text{N}_2\text{H}_4 \cdot \text{HNO}_3$  (aq.) +  $6\text{HNO}_3$  (aq.) +  $21\text{AgNO}_3$  (aq.) +  $32\text{NH}_3$  (aq.) =  $21\text{Ag}$  (c) +  $\frac{5}{2}\text{N}_2$  (g) +  $33\text{NH}_4\text{NO}_3$  (aq.), to be 922.2. See also Thomsen.<sup>17</sup>

$\text{N}_2\text{H}_4 \cdot \text{HCl}$  (aq.). Bach<sup>1</sup> measured the heat of mixing aqueous hydrazine with aqueous hydrochloric acid.

$\text{N}_2\text{H}_4 \cdot \text{HCl}$  (c). Bach<sup>1</sup> measured the heat of solution.

$\text{N}_2\text{H}_4 \cdot 2\text{HCl}$  (aq.). Bach<sup>1</sup> measured the heat of mixing  $\text{N}_2\text{H}_4$  (aq.) with  $2\text{HCl}$  (aq.).

$\text{N}_2\text{H}_4 \cdot 2\text{HCl}$  (c). Bach<sup>1</sup> measured the heat of solution.

$\text{N}_2\text{H}_4 \cdot \text{H}_2\text{O}$  (c). Bach<sup>1</sup> measured the heat of solution.

$\text{N}_2\text{H}_4 \cdot \text{HNO}_3$  (aq.). Bach<sup>1</sup> measured the heat of mixing  $\text{N}_2\text{H}_4$  (aq.) with  $\text{HNO}_3$  (aq.).

$\text{N}_2\text{H}_4 \cdot 2\text{HNO}_3$  (aq.). Bach<sup>1</sup> measured the heat of mixing  $\text{N}_2\text{H}_4$  (aq.) with  $2\text{HNO}_3$  (aq.).

$\text{NH}_3\text{HN}_3$  (c). Berthelot and Matignon<sup>3</sup> measured the heat of combustion of ammonium azide,  $\text{NH}_3\text{HN}_3$  (c) +  $\text{O}_2$  (g) =  $\text{N}_2$  (g) +  $2\text{H}_2\text{O}$  (liq.). Berthelot<sup>107</sup> corrected the original data on this reaction, obtaining  $Q = 157.0$ ; whence, for  $\text{NH}_3\text{HN}_3$  (c),  $Q_f = -20.2$ .

$\text{NH}_3\text{HN}_3$  (aq.). For the heat of solution of solid ammonium azide, Berthelot and Matignon<sup>3</sup> found  $-7.08_{700}^{12}$  and Bach<sup>1</sup>  $-6.73_{600}^{17}$ .

$\text{HN}_3$  (aq.). Bach<sup>1</sup> found for the reaction,  $\text{NH}_3\text{HN}_3$  (aq.) +  $\text{HCl}$  (aq.) =  $(\text{NH}_4\text{Cl} + \text{HN}_3)$  (aq.),  $Q = 3.97$ ; whence, for  $\text{HN}_3$  (aq.),  $Q_f = -54.6$ .

$\text{NH}_4\text{X} \cdot n\text{NH}_3$  (c). The values for the heats of dissociation of the ammonium halides are computed from the dissociation pressure data of Troost<sup>1</sup> and Roozeboom.<sup>7</sup>

$\text{NH}_4\text{NO}_3 \cdot 5\text{NH}_3$  (liq.). The heat of dissociation of this substance is computed from the dissociation pressure data of Troost.<sup>2</sup>

$\text{NCl}_3$  ( $\text{CCl}_4$ ). Deville and Hautefeuille<sup>1</sup> measured the heats of two

reactions involving nitrogen trichloride:  $\text{NH}_4\text{Cl (c)} + 3\text{Cl}_2 \text{ (aq.)} = 4\text{HCl (aq.)} + \text{NCl}_3 \text{ (liq.)}$  and  $\text{NH}_4\text{Cl (c)} + 3\text{HClO (aq.)} = \text{HCl (aq.)} + 3\text{H}_2\text{O (liq.)} + \text{NCl}_3 \text{ (liq.)}$ . The observed heat values were 10.85 and 40.9, respectively, but there is considerable doubt about the second reaction. As written above, these data yield for  $\text{NCl}_3 \text{ (liq.)}$ ,  $Q_f = -56.1$  and  $-43.3$ . Thomsen<sup>5</sup> corrected an error in the original calculations of Deville and Hautefeuille, but made another error at the same time. The recent accurate data of Noyes and Tuley<sup>1</sup> on the reaction,  $\text{NCl}_3(\text{CCl}_4) + 4\text{HCl (g)} = \text{NH}_4\text{Cl (c)} + 3\text{Cl}_2 \text{ (g)}$ , give  $Q = 41.8$ ; whence, for  $\text{NCl}_3(\text{CCl}_4)$ ,  $Q_f = -55.0$ .

$\text{N}_2\text{O}_3 \cdot (\text{SO}_3)_2 \text{ (c)}$ . Vaughan<sup>1</sup> measured the heat of solution of this substance in aqueous KOH.

$\text{HNO}_3 \cdot n\text{H}_2\text{SO}_4 \cdot n'\text{H}_2\text{O (liq.)}$ . McDavid<sup>1</sup> measured the heat of mixing aqueous nitric and sulfuric acids in various proportions.

### PHOSPHORUS

**P (c, I, yellow).** Standard state.

**P (c, II, yellow).** Bridgman<sup>2</sup> reported the heat of transition.

**P (c, red).** The exact thermodynamic status of the solid forms of phosphorus other than yellow has not yet been determined. The vapor pressure of red phosphorus was measured by Chapman<sup>1</sup> and Troost and Hautefeuille<sup>1</sup>; and the latter calculated, from the difference in the temperature coefficients of the vapor pressures of the yellow and red forms, the heat of transition from yellow to red to be 4.2 at 700°. From the difference in the heats of combustion of the yellow and red forms of phosphorus, Giran<sup>1</sup> found  $T = 3.7$ . A more direct measurement of the heat of transition is that from the data of Giran<sup>1</sup> on the heats of reaction of the two forms with bromine in carbon disulfide,  $Q = 38.79$  and 43.01 for the red and yellow forms, respectively. These data yield  $T = 4.22$ . Giran<sup>1</sup> found that the so-called violet or black phosphorus had a heat of reaction of 38.56 with bromine in carbon disulfide. Apparently this form is thermochemically identical with the red form.

**P (liq., yellow).** The existing data on the heat of fusion of P (c, I, yellow) are: Person,<sup>1</sup>  $-0.156^{44.2}$ ; Desaine,<sup>2</sup>  $-0.16^{44}$ ; Peterson,<sup>4</sup>  $-0.147^{44}$ ; Tammann,<sup>3</sup>  $-0.152^{44.1}$ .

**P<sub>4</sub> (g).** Phosphorus molecules at saturation pressure below the boiling point are practically all tetratomic, according to the vapor density measurements of Deville and Troost,<sup>1,2</sup> Meyer and Biltz,<sup>1</sup> Chapman,<sup>1</sup> Preuner and Brockmoller,<sup>1</sup> Stock, Gibson, and Stamm,<sup>1</sup> Hittorf,<sup>1</sup> Truthe,<sup>1</sup> and Mitscherlich.<sup>1</sup> The vapor pressure data of Centnerszwer,<sup>1</sup> MacRae and Voorhis,<sup>1</sup> and Smits and Bokhorst<sup>2</sup> on solid phosphorus yield  $-15.1$  for the heat of sublimation. Vapor pressure data on liquid phosphorus were reported by Jolibois,<sup>1</sup> Schrötter,<sup>1</sup> MacRae and Van Voorhis,<sup>1</sup> Marckwald and Helmholtz,<sup>1</sup> Preuner and Brockmoller,<sup>1</sup> and Smits and Bokhorst.<sup>1</sup> For the heat of vaporization of liquid phosphorus to give gaseous P<sub>4</sub> at 300°, Preuner and Brockmoller<sup>1</sup> gave  $-12.5$ , Smits and Bok-

horst<sup>2</sup> gave  $-12.5$ , de Forcrand<sup>37</sup> calculated  $-12.2$ , and we have computed  $-12.6$ .

**P<sub>2</sub> (g).** From vapor density measurements, Preuner and Brockmoller<sup>1</sup> deduced, for the reaction,  $P_4(g) = 2P_2(g)$ ,  $Q^{800} = -31.5$ . Assuming  $\Delta C_p = 3$ , we have computed  $Q = -30.0$  at  $18^\circ$ .

**P (g).** From vapor density data, Preuner and Brockmoller<sup>1</sup> deduced for the reaction,  $P_2(g) = 2P(g)$ ,  $Q^{1400} = -45.5$ . Taking  $\Delta C_p = 3$ , we have computed  $Q = -42.2$  at  $18^\circ$ .

The ionization potentials of P (gas) are evaluated from the following: first step, Saltmarsh,<sup>1</sup> McLennan and McLay,<sup>1</sup> Kiess<sup>2</sup>; second step, Bowen<sup>3</sup>; third step, Bowen and Millikan,<sup>1</sup> Millikan and Bowen<sup>1</sup>; fourth step, Bowen and Millikan<sup>1</sup>; fifth step, Bowen and Millikan.<sup>2</sup>

**P<sub>2</sub> (CS<sub>2</sub>).** Giran<sup>1</sup> measured the heat of solution of yellow phosphorus in carbon disulfide.

**P<sub>2</sub>O<sub>5</sub> (c).** Data on the heat of combustion of phosphorus were reported by Favre and Silbermann,<sup>12</sup> Abria,<sup>1</sup> Andrews,<sup>14, 16</sup> Troost and Hautefeuille,<sup>7</sup> Berthelot,<sup>50</sup> and Giran.<sup>1</sup> The best of these data are undoubtedly those of Giran,<sup>1</sup> who measured the heats of combustion in a bomb calorimeter, the energy equivalent of which was determined by burning naphthalene. The result given by Giran<sup>1</sup> is not labeled either for constant volume or for constant pressure, but he uses the value in the latter sense, so we have assumed that he made the correction to constant pressure. Correction of his data to new atomic weights and for the new value for the heat of combustion of naphthalene yields, for the  $P_2O_5$  formed in his bomb,  $Q = 366.4$ . Giran<sup>1</sup> found the difference in the heats of solution of the above form and the crystalline form of  $P_2O_5$  to be  $-6.42$ , so that, for  $P_2O_5(c)$ , we have computed  $Q_f = 360.0$ .

**P<sub>2</sub>O<sub>5</sub> (amorp.).** Giran<sup>1</sup> found the heat of solution of the amorphous form of  $P_2O_5$  to be  $33.81$ , as compared with  $40.79$  for the crystalline form under the same conditions. This gives for the reaction,  $P_2O_5(c) = P_2O_5(\text{amorphous})$ ,  $Q = 6.98$ .

**P<sub>2</sub>O<sub>5</sub> (gls.).** Giran<sup>1</sup> found the heat of solution of the vitreous form of  $P_2O_5$  to be  $29.09$ , as compared with  $40.79$  for the crystalline form under the same conditions. This gives, for  $P_2O_5(c) = P_2O_5(\text{gls.})$ ,  $Q = 11.70$ .

**P<sub>2</sub>O<sub>5</sub> (g).** The vapor pressure data of Hoeflake and Scheffer<sup>1</sup> (see also Hautefeuille and Perry<sup>1</sup> and Smits and Rutgers<sup>1</sup>) yield, for the heat of sublimation, the following values for the various forms of solid  $P_2O_5$ : metastable crystals,  $-22.8$ ; vitreous form,  $-20.4$ ; stable crystalline form,  $-36.9$ . These data are in disagreement with our values for the various solid forms, and may be explained by assuming that equilibrium was not attained. The vapor density of phosphorus pentoxide is not known with any accuracy. The old data of Tilden and Barnett<sup>1</sup> and West<sup>1</sup> indicate association in the vapor.

**HPO<sub>3</sub> (aq.).** Giran<sup>1</sup> found that the solution of crystalline  $P_2O_5$  in water, with  $Q = 40.79$ , resulted in the formation of aqueous metaphosphoric acid; whence, for  $HPO_3(aq.)$ ,  $Q_f = 234.6$ .

**HPO<sub>3</sub> (c).** Giran<sup>1</sup> found the heat of solution in water to form aqueous metaphosphoric acid to be 9.76.

**H<sub>3</sub>PO<sub>4</sub> (aq.).** In the presence of strong acids, sulfuric acid in particular, aqueous metaphosphoric acid is transformed into aqueous orthophosphoric acid. Giran<sup>1</sup> measured the heat of solution of solid HPO<sub>3</sub> in aqueous sulfuric acid to be 12.91. Hence, for the reaction, HPO<sub>3</sub> (aq.) + H<sub>2</sub>O (liq.) = H<sub>3</sub>PO<sub>4</sub> (aq.),  $Q=3.15$ , and for H<sub>3</sub>PO<sub>4</sub> (aq.),  $Qf=306.1$ . Thomsen<sup>15</sup> measured the heat of the reaction of phosphorus with aqueous HIO<sub>3</sub> to form a mixture of aqueous H<sub>3</sub>PO<sub>3</sub> and H<sub>3</sub>PO<sub>4</sub>, and the heat of the reaction of bromine water with aqueous H<sub>3</sub>PO<sub>3</sub>: HIO<sub>3</sub> (aq.) + 1.6 P (c, yellow) + 2.4 H<sub>2</sub>O (liq.) = H<sub>3</sub>PO<sub>3</sub> (aq.) + 0.6 H<sub>3</sub>PO<sub>4</sub> (aq.) + HI (aq.), H<sub>3</sub>PO<sub>3</sub> (aq.) + Br<sub>2</sub> (aq.) + H<sub>2</sub>O (liq.) = H<sub>3</sub>PO<sub>4</sub> (aq.) + 2HBr (aq.). We have computed Thomsen's data on these reactions, obtaining  $Q=205.2$  and 64.9, respectively. The sum gives for the reaction, HIO<sub>3</sub> (aq.) + 1.6 P (c, yellow) + 3.4 H<sub>2</sub>O (liq.) + Br<sub>2</sub> (aq.) = 1.6 H<sub>3</sub>PO<sub>4</sub> (aq.) + 2HBr (aq.) + HI (aq.),  $Q=270.1$ , whence, for H<sub>3</sub>PO<sub>4</sub> (aq.),  $Qf=306.2$ . Data on the heat of dilution of aqueous H<sub>3</sub>PO<sub>4</sub> were reported by Thomsen.

**H<sub>3</sub>PO<sub>4</sub> (liq.), H<sub>3</sub>PO<sub>4</sub> (c).** Thomsen<sup>15</sup> measured the heats of solution. Rideal<sup>1</sup> calculated the heat of fusion to be  $-2.87$ .

**H<sub>3</sub>PO<sub>4</sub> ·  $\frac{1}{2}$  H<sub>2</sub>O (c).** Thomsen<sup>15</sup> measured the heat of solution.

**H<sub>3</sub>PO<sub>4</sub> ·  $\frac{1}{2}$  H<sub>2</sub>O (liq.).** Thomsen<sup>15</sup> measured the heat of solution.

**H<sub>3</sub>PO<sub>3</sub> (aq.).** Thomsen's<sup>15</sup> data on the reaction between aqueous bromine and aqueous phosphorous acid,  $Q=64.9$ , yield, for H<sub>3</sub>PO<sub>3</sub> (aq.),  $Qf=229.0$ . Thomsen<sup>15</sup> measured the heats of the following reactions: PCl<sub>3</sub> (liq.) + Cl<sub>2</sub> (g) = PCl<sub>5</sub> (c), PCl<sub>5</sub> (c) + 4H<sub>2</sub>O (liq.) = (H<sub>3</sub>PO<sub>4</sub> + 5HCl) (aq.), and PCl<sub>3</sub> (liq.) + 3H<sub>2</sub>O (liq.) = (H<sub>3</sub>PO<sub>3</sub> + 3HCl) (aq.). Combining these equations and neglecting the heats of mixing gives H<sub>3</sub>PO<sub>3</sub> (aq.) + Cl<sub>2</sub> (g) + H<sub>2</sub>O (liq.) = H<sub>3</sub>PO<sub>4</sub> (aq.) + 2HCl (aq.). These data yield, for H<sub>3</sub>PO<sub>3</sub> (aq.),  $Qf=228.8$ .

**H<sub>3</sub>PO<sub>3</sub> (liq.), H<sub>3</sub>PO<sub>3</sub> (c).** Thomsen<sup>15</sup> measured the heat of solution of the solid and liquid in water.

**P<sub>2</sub>O<sub>3</sub> (g).** The vapor pressure data of Schenck, Mihr, and Balthien,<sup>1</sup> when plotted as the logarithm of the pressure against the reciprocal of the absolute temperature, yield two straight lines of widely different slopes.

**H<sub>3</sub>PO<sub>2</sub> (aq.).** Thomsen<sup>15</sup> measured the heat of the reaction, BaH<sub>4</sub>P<sub>2</sub>O<sub>4</sub> · H<sub>2</sub>O (c) + 4Br<sub>2</sub> (aq.) + 3H<sub>2</sub>O (liq.) = (2H<sub>3</sub>PO<sub>4</sub> + 6HBr + BaBr<sub>2</sub>) (aq.), to be 277.4. Taking the heat of solution of the salt, and assuming the heats of neutralization of Ba(OH)<sub>2</sub> (aq.) with HBr (aq.) and H<sub>3</sub>PO<sub>2</sub> (aq.) to be 27.78 and 30.93, respectively, we have computed, for H<sub>3</sub>PO<sub>2</sub> (aq.),  $Qf=141.2$ .

**H<sub>3</sub>PO<sub>2</sub> (c), H<sub>3</sub>PO<sub>2</sub> (liq.).** Thomsen<sup>15</sup> measured the heats of solution of the solid and the liquid.

**H<sub>4</sub>P<sub>2</sub>O<sub>5</sub> (aq.).** Amat<sup>1</sup> found the heat of hydration of pyrophosphorous acid, H<sub>4</sub>P<sub>2</sub>O<sub>5</sub> (aq.) + H<sub>2</sub>O (liq.) = 2H<sub>3</sub>PO<sub>2</sub> (aq.), to be 4.9; whence, for H<sub>4</sub>P<sub>2</sub>O<sub>5</sub> (aq.),  $Qf=384.3$ .

$\text{H}_4\text{P}_2\text{O}_6$  (aq.). There are no data with which to compute the heat of formation of aqueous hypophosphoric acid.

$\text{H}_4\text{P}_2\text{O}_6$  (c). Joly<sup>2</sup> measured the heat of solution of the solid.

$\text{H}_4\text{P}_2\text{O}_6 \cdot 2\text{H}_2\text{O}$  (c). Joly<sup>2</sup> measured the heat of solution of the solid.

$\text{H}_4\text{P}_2\text{O}_6 \cdot 2\text{H}_2\text{O}$  (liq.). Joly<sup>2</sup> measured the heat of solution of the liquid.

$\text{H}_4\text{P}_2\text{O}_7$  (liq.). Giran<sup>1</sup> measured the heat of solution of the liquid.

$\text{H}_4\text{P}_2\text{O}_7$  (c). Giran<sup>1</sup> measured the heat of solution of the solid.

$\text{H}_4\text{P}_2\text{O}_7$  (aq.). In a manner similar to that used for converting metaphosphoric into orthophosphoric acid, Giran<sup>1</sup> found for the reactions,  $\text{H}_4\text{P}_2\text{O}_7$  (liq.) +  $\text{H}_2\text{O}$  (liq.) =  $2\text{H}_3\text{PO}_4$  (aq.) and  $\text{H}_4\text{P}_2\text{O}_7$  (c) +  $\text{H}_2\text{O}$  (liq.) =  $2\text{H}_3\text{PO}_4$  (aq.),  $Q = 14.47$  and  $12.35$ , respectively.

$\text{H}_4\text{P}_2\text{O}_7 \cdot 1\frac{1}{2}\text{H}_2\text{O}$  (c). Giran<sup>1</sup> measured the heat of solution.

$\text{H}_4\text{P}_2\text{O}_7 \cdot 1\frac{1}{2}\text{H}_2\text{O}$  (liq.). Giran<sup>1</sup> measured the heat of solution of the liquid.

$\text{PCl}_3$  (liq.). Thomsen<sup>15</sup> and Berthelot and Louguinine<sup>2</sup> measured the heat of solution of liquid  $\text{PCl}_3$  in water to be  $65.1$ .

$\text{PCl}_3$  (g). Antoine<sup>2, 3</sup> and Andrews<sup>14</sup> found the heat of vaporization of liquid  $\text{PCl}_3$  to be  $-6.9$  and  $-7.1$ , respectively. Vapor pressure data were reported by Regnault.<sup>4, 7</sup>

$\text{PCl}_5$  (c). Thomsen<sup>15</sup> and Berthelot and Louguinine<sup>2</sup> measured the heat of solution of this substance in water. Their data give  $Q = 123.4$  for the reaction,  $\text{PCl}_5$  (c) +  $4\text{H}_2\text{O}$  (liq.) =  $(\text{H}_3\text{PO}_4 + 5\text{HCl})$  (aq.), from which we have computed, for  $\text{PCl}_5$  (c),  $Q_f = 106.5$ . Thomsen's<sup>15</sup> data for the reaction,  $\text{PCl}_3$  (liq.) +  $\text{Cl}_2$  (g) =  $\text{PCl}_5$  (c),  $Q = 29.69$ , yield, for  $\text{PCl}_5$  (c),  $Q_f = 106.6$ . See also Andrews.<sup>16</sup>

$\text{PCl}_5$  (g). Smith and Lombard<sup>2</sup> reported the value  $-15.5$  for the heat of sublimation of solid  $\text{PCl}_5$ , corrected for dissociation. The data of Smith and Calvert<sup>1</sup> show that gaseous  $\text{PCl}_5$  is partly dissociated. The equilibrium data of Mitscherlich,<sup>1</sup> Cahours,<sup>1</sup> Deville,<sup>1, 2, 3</sup>, Naumann,<sup>1, 3</sup> Horstmann,<sup>2</sup> Gibbs,<sup>2</sup> Wichelhaus,<sup>1</sup> Troost and Hautefeuille,<sup>9, 10, 11</sup> Debray,<sup>1</sup> Wurtz,<sup>1</sup> Brill,<sup>3</sup> Smith and Lombard,<sup>2</sup> and Holland<sup>1</sup> yield for the reaction,  $\text{PCl}_3$  (g) +  $\text{Cl}_2$  (g) =  $\text{PCl}_5$  (g),  $Q = 21 \pm 2$ .

$\text{PBr}_3$  ( $\text{CS}_2$ ). Giran<sup>1</sup> measured the heat of the reaction of liquid bromine with yellow phosphorus, each dissolved in carbon disulfide, to be  $43.5$ .

$\text{PBr}_3$  (liq.). Berthelot and Louguinine<sup>2</sup> measured the heats of solution of liquid  $\text{PBr}_3$  in water and in aqueous  $\text{KOH}$  to be  $64.0$  and  $130.5$ , respectively, from which we have computed, for  $\text{PBr}_3$  (liq.),  $Q_f = 45.7$  and  $48.8$ , respectively.

$\text{POCl}_3$  (liq.). For the heat of solution in water, Thomsen<sup>15</sup> found  $72.19_{1000}$ <sup>20</sup>; Berthelot and Louguinine,<sup>2</sup>  $74.6$ .

$\text{POCl}_3$  (c). Oddo<sup>1</sup> computed the heat of fusion to be  $-3.2^{1.7}$ , from data on the freezing point lowering.

$\text{POCl}_3$  (g). Arie<sup>1</sup> calculated the heat of vaporization of the liquid to

be  $-8.70^{25}$ , from vapor pressure data. Calculation by way of Trouton's rule yields  $-8.1^{100.7}$ .

**PBr<sub>5</sub> (c).** Ogier<sup>4</sup> reported the heat of solution to be 14.7.

**POBr<sub>3</sub> (c).** Ogier<sup>4</sup> reported the heat of solution to be 79.7.

**PI<sub>2</sub> (c).** The data of Ogier<sup>4</sup> and Berthelot and Louguinine<sup>2</sup> yield, for this substance,  $Q_f = 10.9$ .

**PI<sub>3</sub> (CS<sub>2</sub>).** Ogier<sup>4</sup> measured the heat of solution in carbon disulfide.

**PH<sub>3</sub> (g).** The data of Ogier,<sup>1</sup> who measured the heat of reaction between gaseous phosphine and saturated bromine water, yield, for PH<sub>3</sub> (g),  $Q_f = -3.6$ . Lemoult<sup>10</sup> measured the heat of combustion of phosphine in oxygen to form H<sub>3</sub>PO<sub>4</sub>, and his data yield,  $Q = 309.8$ , whence, for PH<sub>3</sub> (g),  $Q_f = -6.3$ . The equilibrium data of Ipat'ev and Frost<sup>1</sup> on the reaction,  $4\text{PH}_3\text{ (g)} = \text{P}_4\text{ (g)} + 6\text{H}_2\text{ (g)}$ , yield  $Q = -22.66$ , whence, for PH<sub>3</sub> (g),  $Q_f = 2.34$ . We have been unable to interpret similar data obtained by Drummond.<sup>1</sup>

**PH<sub>3</sub> (liq.).** The data of McIntosh and Steel<sup>1</sup> and Henning and Stock<sup>1</sup> yield  $V = -3.9^{80}$ .

**P<sub>2</sub>H (c).** Ogier<sup>1</sup> found for the heat of reaction of solid P<sub>2</sub>H with saturated bromine water  $Q = 367.2$ ; whence, for P<sub>2</sub>H (c),  $Q_f = 11.9$ .

**PH<sub>4</sub>I (c).** Ogier<sup>1</sup> measured the heat of solution to be  $-4.77$ , whence, for PH<sub>4</sub>I (c),  $Q_f = 20.4$ . The dissociation pressure data of Smith and Calvert<sup>1</sup> yield  $Q = 12.2$ , and, assuming that the vapor is completely dissociated into PH<sub>3</sub> (g) and HI (g), we have computed, for PH<sub>4</sub>I (c),  $Q_f = 20.9$ .

**PH<sub>4</sub>Br (c).** Ogier<sup>1</sup> measured the heat of solution to be  $-3.03$ , whence, for PH<sub>4</sub>Br (c),  $Q_f = 33.8$ . The dissociation pressure data of Johnson<sup>2</sup> yield  $Q = 24.0$ , whence, assuming complete dissociation into PH<sub>3</sub> (g) and HBr (g),  $Q_f = 34.9$ . Vapor density measurements indicate that the vapor is not completely dissociated.

**PH<sub>4</sub>Cl (g).** From vapor density data, Briner<sup>1, 3, 4</sup> computed, for HCl (g) + PH<sub>3</sub> (g) = PH<sub>4</sub>Cl (g),  $Q = 16.4$ . See also Tammann<sup>1, 3</sup> and Scheffer.<sup>5</sup>

**PH<sub>4</sub>Cl (c).** Briner<sup>1, 3, 4</sup> computed the heat of sublimation to be  $-27.0$ .

**PH<sub>3</sub> · 6 H<sub>2</sub>O (c).** The dissociation pressure data of Cailletet and Bordet<sup>1</sup> and de Forcrand and Taboury<sup>1</sup> yield  $Q = -13.5$  for the reaction,  $\text{PH}_3 \cdot 6 \text{H}_2\text{O (c)} = \text{PH}_3\text{ (g)} + 6 \text{H}_2\text{O (liq.)}$ , at 0°.

**P<sub>3</sub>N<sub>5</sub> (c).** Stock and Wrede<sup>1</sup> measured the heat of combustion to be 1099.4.

**(NH<sub>4</sub>)<sub>n</sub>H<sub>3-n</sub>PO<sub>4</sub> (aq.).** Berthelot and Louguinine<sup>3</sup> measured the heats of mixing aqueous H<sub>3</sub>PO<sub>4</sub> with 1, 2, and 3 moles of aqueous NH<sub>3</sub>, respectively.

**(NH<sub>4</sub>)<sub>n</sub>H<sub>3-n</sub>PO<sub>4</sub> (c).** There are no data on the heats of solution of any of the ammonium phosphates. Warren,<sup>1</sup> from dissociation pressure data, computed for (NH<sub>4</sub>)<sub>3</sub>PO<sub>4</sub> (c) = NH<sub>3</sub> (g) + (NH<sub>4</sub>)<sub>2</sub>HPO<sub>4</sub>,  $Q = -9.40$ , and for (NH<sub>4</sub>)<sub>2</sub>HPO<sub>4</sub> (c) = NH<sub>3</sub> (g) + NH<sub>4</sub>H<sub>2</sub>PO<sub>4</sub> (c),  $Q = -19.05$ .

## ARSENIC

**As (solid).** There are at least three forms of solid arsenic: As ( $c, \alpha$ ), metallic, trigonal, of high density, stable; As ( $c, \gamma$ ), yellow, cubic, of low density, analogous to yellow phosphorous; As (amorphous  $\beta$ ), grey or mirrorlike. Another form, the brown, may be identical with the  $\beta$  form. As ( $c, \alpha$ ) is taken as the standard state. Peterson<sup>5</sup> measured the heats of reaction of the various forms of arsenic with chlorine and with bromine, and concluded that for the  $\gamma$  to  $\alpha$  transition,  $T=3.53$ , and for the  $\gamma$  to  $\beta$  transition,  $T=4.12$ . Berthelot and Engel<sup>1</sup> gave  $T=1.0$  for the  $\alpha$  to  $\beta$  transition. Laschtschenko<sup>7</sup> reported, for the transition from  $\alpha$  to  $\gamma$ ,  $T=-0.55^{740}$ , or about  $-1.5$  at  $18^\circ$ .

**As<sub>4</sub> (g).** The vapor pressure data of Preuner and Brockmoller,<sup>1</sup> Gibson,<sup>1</sup> Ruff and Mugdan,<sup>1</sup> Ruff and Bergdahl,<sup>1</sup> Horiba,<sup>2</sup> Goubau,<sup>1</sup> Heike,<sup>1</sup> Jonker<sup>1</sup> Jolibois,<sup>3</sup> Krafft and Knocke,<sup>1</sup> and Rassow<sup>1</sup> yield  $-11.3^{400}$  for the heat of vaporization of liquid arsenic and  $-31.8^{400}$  for the heat of sublimation of the solid, both values computed for As<sub>4</sub> (g). According to the vapor density data (see following) arsenic vapor at or below the boiling point is practically all As<sub>4</sub>.

**As (liq.).** From the above data on the heat of vaporization and sublimation is obtained the heat of fusion.

**As<sub>2</sub> (g).** The vapor density data of Mitscherlich,<sup>1</sup> Bineau,<sup>1</sup> Deville and Troost,<sup>2</sup> Mensching and Meyer,<sup>1</sup> Biltz and Meyer,<sup>1</sup> and Preuner and Brockmoller<sup>1</sup> yield for the reaction,  $\text{As}_4(\text{g}) = 2 \text{As}_2(\text{g})$ ,  $Q^{1000} = -25.0$ , or about  $-21$  at  $18^\circ$ .

**As (g).** The foregoing data yield for the reaction,  $\text{As}_2(\text{g}) = 2 \text{As}(\text{g})$ ,  $Q^{1000} = -38.0$ , or about  $-35$  at  $18^\circ$ . The values for the energy states of gaseous monatomic arsenic are from Meggers and de Bruin,<sup>1</sup> Rao, Gartlein, Pathabhiramiah, and Rao,<sup>1</sup> Rao,<sup>2</sup> Rao and Badami,<sup>1</sup> and Sawyer and Humphreys.<sup>1</sup>

**AsF<sub>5</sub> (c), AsF<sub>5</sub> (liq.).** Ruff, Menzel, and Plant<sup>1</sup> reported values for the heats of fusion and vaporization.

**AsCl<sub>3</sub> (liq.).** Andrews<sup>16</sup> and Thomsen<sup>15</sup> measured the heat of reaction between gaseous chlorine and metallic arsenic. The latter's data yield  $Q_f = 71.54$ . Peterson<sup>5</sup> reported 72.5.

**AsCl<sub>3</sub> (g).** The vapor pressure data of Baxter, Bezzenberger, and Wilson<sup>1</sup> and Maier<sup>1</sup> yield  $-7.50$  for the heat of vaporization. The data of Beckmann<sup>1</sup> and Kolossowsky<sup>2</sup> on the elevation of the boiling point yield  $-8.08$ . See also Regnault.<sup>6, 10</sup>

**H<sub>3</sub>AsO<sub>4</sub> (aq.).** Thomsen<sup>15</sup> measured the heat of the reaction,  $\text{As}(\text{c}, \alpha) + \frac{5}{2} \text{Br}_2(\text{liq.}) + 4 \text{H}_2\text{O}(\text{liq.}) = (5 \text{HBr} + \text{H}_3\text{AsO}_4)(\text{aq.})$ , to be 83.7; whence, for  $\text{H}_3\text{AsO}_4(\text{aq.})$ ,  $Q_f = 214.5$ . The data of Berthelot and Engel<sup>1</sup> on the same reaction yield about the same value.

**As<sub>2</sub>O<sub>5</sub> (aq.).** This is taken as equivalent to  $2 \text{H}_3\text{AsO}_4(\text{aq.}) - 3 \text{H}_2\text{O}(\text{liq.})$ .

$\text{As}_2\text{O}_5$  (c). Thomsen<sup>15</sup> measured the heat of solution in 12 NaOH (200).

$\text{As}_2\text{O}_3$  (aq.). The data of Thomsen<sup>15</sup> yield, for the heat of oxidation of aqueous arsenious acid with aqueous iodic acid,  $Q = 148.5$ , which gives, for  $\text{As}_2\text{O}_3$  (aq.),  $Qf = 146.9$ . Berthelot<sup>151</sup> reported  $Q = 52.6$  for the heat of the reaction between aqueous arsenious acid and liquid bromine; whence, for  $\text{As}_2\text{O}_3$  (aq.),  $Qf = 148.4$ . Thomsen<sup>15</sup> measured the heat of solution of  $\text{AsCl}_3$  (liq.) in water to be 17.58, whence, for  $\text{As}_2\text{O}_3$  (aq.),  $Qf = 147.0$ .

$\text{As}_2\text{O}_3$  (c, octahedral). Schuhmann<sup>1</sup> measured the electromotive force at various temperatures for the cell in which the reaction was  $2 \text{As} (\text{c}, \alpha) + 3 \text{H}_2\text{O} (\text{liq.}) = \text{As}_2\text{O}_3 (\text{c, octahedral}) + 3 \text{H}_2 (\text{g})$ , and computed  $Q = 51.0$ , from which, for  $\text{As}_2\text{O}_3$  (c, octahedral),  $Qf = 154.1$ . Thomsen<sup>15</sup> measured the heat of solution of octahedral arsenic trioxide in four normal sodium hydroxide to be 7.52, from which, for  $\text{As}_2\text{O}_3$  (c, octahedral),  $Qf = 154.1$ .

$\text{As}_2\text{O}_3$  (g),  $\text{As}_4\text{O}_6$  (g). According to Mitscherlich<sup>1</sup> and Biltz<sup>7</sup> the vapor of arsenic trioxide is mostly  $\text{As}_4\text{O}_6$  at low temperatures and mostly  $\text{As}_2\text{O}_3$  at high temperatures. Vapor pressure data were reported for both the solid and liquid forms by Rushton and Daniels,<sup>1</sup> Smellie,<sup>1</sup> Stelzner,<sup>1</sup> Niederschulte,<sup>1</sup> Welch and Duschak,<sup>1</sup> and Biltz.<sup>7</sup> From the data of Biltz, we have computed for the reaction,  $\text{As}_4\text{O}_6 (\text{g}) = 2 \text{As}_2\text{O}_3 (\text{g})$ ,  $Q = -17$ .

$\text{As}_2\text{O}_3$  (c, monoclinic). We have estimated the heat of transformation into the octahedral form from the above vapor pressure data.

$\text{As}_2\text{O}_3$  (liq.). The above vapor pressure data yield a surprisingly large value for the heat of fusion of solid arsenic trioxide.

$\text{AsBr}_3$  (c). Berthelot<sup>50</sup> measured the heat of solution in aqueous KOH to be 59.8 at 9°.

$\text{AsBr}_3$  (liq.). Tolloczko and Meyer<sup>1</sup> reported a value for the heat of fusion of the solid.

$\text{AsBr}_3$  (g). The meager vapor pressure data of Walden<sup>2</sup> and Jager<sup>1</sup> yield  $-11.0$  for the heat of vaporization. Trouton's rule gives  $-10.0$ .

$\text{AsI}_3$  (c). Berthelot<sup>50</sup> measured the heat of solution in aqueous KOH to be 46.2 at 9°.

$\text{AsI}_3$  (liq.). We have estimated the heat of fusion.

$\text{AsI}_3$  (g). The vapor pressure data of Horiba and Inouye<sup>1</sup> yield  $-19.2$  for the heat of vaporization of the liquid.

$\text{AsH}_3$  (g). Ogier<sup>2</sup> measured the heat of reaction of arsine with liquid bromine and water to be 212.9.

$\text{AsH}_3 \cdot 6 \text{H}_2\text{O}$  (c). de Forcrand<sup>49</sup> determined the heat of dissociation of the hexahydrate.

## ANTIMONY

**Sb** (c). The metallic trigonal form is taken as the standard state. There is apparently a transition between 100° and 150°, but no thermal data on it are recorded. Another form of antimony is the so-called

"explosive" form prepared by electrolysis, and its heat of transformation into the metallic trigonal form is given by several investigators: Pebal,<sup>1</sup> 2.52; Cohen and Strengers,<sup>1</sup> 2.32 by direct measurement, and 2.56 from the difference in the heats of reaction with bromine.

**Sb (liq.).** The data on the heat of fusion of solid antimony at its melting point, 630°, are: Wust, Meuthen, and Durrer,<sup>1</sup> -4.67; Umino,<sup>4</sup> -4.9; Laschtschenko,<sup>5</sup> -4.85; Awbery and Griffiths,<sup>1</sup> -2.9. See also Herz.<sup>2</sup>

**Sb<sub>2</sub> (g).** The vapor pressure data of Greenwood,<sup>2, 5</sup> van Liempt,<sup>2</sup> Ruff and Bergdahl,<sup>1</sup> and Ruff and Mugdan<sup>1</sup> were reviewed by Johnston, Fenwick, and Leopold,<sup>1</sup> and yield -45.2<sup>1200</sup> for the heat of vaporization of the liquid. According to Meyer and Biltz,<sup>1</sup> the vapor near the boiling point, 1440°, contains some Sb<sub>4</sub> molecules but is mostly Sb<sub>2</sub>. We have estimated, for Sb<sub>2</sub> (g),  $Q_f = -52$ .

**Sb (g).** For the reaction  $\text{Sb}_2 (\text{g}) = 2 \text{Sb} (\text{g})$ , we have estimated  $Q = -27$ . The values for the ionization potentials are from the following: first step, Green and Loring,<sup>2</sup> see also Ruark, Mohler, Foote, and Chenaault<sup>1</sup>; second and third steps, Dhavale,<sup>2</sup> Lang,<sup>2, 4, 5</sup> Rao,<sup>1</sup> Nayaran and Rao,<sup>1</sup> and Gibbs and Vieweg<sup>1</sup>; fourth step, Gibbs and Vieweg,<sup>1</sup> Badami,<sup>1</sup> and Lang<sup>1, 3</sup>; fifth step, Badami,<sup>1</sup> and Lang.<sup>6</sup> See also Bacher and Goudsmit.<sup>1</sup>

**SbCl<sub>3</sub> (c).** Andrews<sup>16</sup> and Thomsen<sup>15</sup> measured the heat of reaction of solid antimony with gaseous chlorine. The data of the latter yield, for SbCl<sub>3</sub> (c),  $Q_f = 91.39$ .

**SbCl<sub>3</sub> (liq.).** Tolloczko,<sup>1, 2</sup> from cryoscopic and calorimetric measurements, deduced the heat of fusion of the solid to be -3.01<sup>73</sup>. Rideal<sup>1</sup> calculated -3.40.

**SbCl<sub>3</sub> (g).** The vapor pressure data of Braune and Tiedje,<sup>1</sup> Maier,<sup>1</sup> and Rotinyanz and Suchodskii<sup>1</sup> yield  $V = -10.95^{125}$ .

**SbCl<sub>5</sub> (liq.).** Thomsen<sup>15</sup> found  $Q = 13.48$  for the reaction  $\text{SbCl}_3 (\text{c}) + \text{Cl}_2 (\text{g}) = \text{SbCl}_5 (\text{liq.})$ .

**SbCl<sub>5</sub> (c).** The cryoscopic data of Moles<sup>1</sup> and Beckmann<sup>2</sup> yield  $F = -2.45^{-6.0}$ .

**SbCl<sub>5</sub> (g).** The vapor pressure data of Braune and Tiedje<sup>1</sup> yield  $V = -11.05^{97}$ , giving, for SbCl<sub>5</sub> (g),  $Q_f = 93.82$ . The equilibrium data of Braune and Tiedje<sup>1</sup> yield  $Q = -16.30$  for the reaction,  $\text{SbCl}_5 (\text{g}) = \text{SbCl}_3 (\text{g}) + \text{Cl}_2 (\text{g})$ ; whence, for SbCl<sub>5</sub> (g),  $Q_f = 93.7$ .

**Sb<sub>2</sub>O<sub>3</sub> (aq.).** Thomsen<sup>15</sup> measured the heats of the reactions,  $4 \text{SbCl}_3 (\text{c}) + 5 \text{H}_2\text{O} (\text{liq.}) = \text{Sb}_4\text{O}_5\text{Cl}_2 (\text{c}) + 10 \text{HCl} (\text{aq.})$  and  $\text{Sb}_4\text{O}_5\text{Cl}_2 (\text{c}) + 2 \text{NaOH} (\text{aq.}) = \text{H}_2\text{O} (\text{liq.}) + (2 \text{NaCl} + 2 \text{Sb}_2\text{O}_3) (\text{aq.})$ , to be 8.91 and 22.75, respectively; whence, for  $4 \text{SbCl}_3 (\text{c}) + 4 \text{H}_2\text{O} (\text{liq.}) + 2 \text{NaOH} (\text{aq.}) = 10 \text{HCl} (\text{aq.}) + (2 \text{NaCl} + 2 \text{Sb}_2\text{O}_3) (\text{aq.})$ ,  $Q = 31.66$ , and for Sb<sub>2</sub>O<sub>3</sub> (aq.),  $Q_f = 166.3$ .

**Sb<sub>2</sub>O<sub>3</sub> (c, orthorhombic).** Guntz<sup>1, 7</sup> measured the heats of solution of SbCl<sub>3</sub> (c) and of Sb<sub>2</sub>O<sub>3</sub> (c, orthorhombic) in concentrated aqueous HCl, and his data yield, for Sb<sub>2</sub>O<sub>3</sub> (c, orthorhombic),  $Q_f = 165.3$ . Guntz<sup>1, 6, 7</sup>

also measured the heats of solution of the same substances in aqueous HF and aqueous HCl+HF, respectively, and his data yield, for  $\text{Sb}_2\text{O}_3$  (c, orthorhombic),  $Q_f=164.5$ . Mixer<sup>9</sup> measured, in a bomb calorimeter, the heat of the reactions of antimony and antimony trioxide with sodium peroxide, and his data yield, for  $\text{Sb}_2\text{O}_3$  (c, orthorhombic),  $Q_f=167.0$ . The dissociation pressure data of Baubigny<sup>1</sup> and Biltz<sup>1</sup> yield, for  $\text{Sb}_2\text{O}_3$  (c, rhombic)  $= 2\text{Sb (liq.)} + \frac{3}{2}\text{O}_2\text{ (g)}$ ,  $Q = -167.4$ , whence, for  $\text{Sb}_2\text{O}_3$  (c, orthorhombic),  $Q_f=153$ , a value which is much too low.

**$\text{Sb}_2\text{O}_3$  (c, octahedral).** From the difference in the heats of solution of  $\text{Sb}_2\text{O}_3$  (c, orthorhombic) and  $\text{Sb}_2\text{O}_3$  (c, octahedral) in aqueous HF, Guntz<sup>7</sup> found the heat of transformation of the former into the latter to be 1.2.

**$\text{Sb}_2\text{O}_5$  (aq.).** Thomsen<sup>15</sup> found the heat of solution of  $\text{SbCl}_5$  (liq.) in water to be 35.27, whence, for  $\text{Sb}_2\text{O}_5$  (aq.),  $Q_f=228.0$ .

**$\text{Sb}_2\text{O}_5$  (c).** Mixer<sup>9</sup> measured the heat of the reactions of antimony and antimony pentoxide with sodium peroxide, and his data yield, for  $\text{Sb}_2\text{O}_5$  (c),  $Q_f=235.7$ .

**$\text{Sb}_4\text{O}_6$  (g).** Hincke,<sup>1</sup> from data on the vapor pressure of solid  $\text{Sb}_2\text{O}_3$ , computed the following:  $2\text{Sb}_2\text{O}_3$  (c, orthorhombic)  $= \text{Sb}_4\text{O}_6$  (g),  $Q = -44.08$ ;  $2\text{Sb}_2\text{O}_3$  (c, cubic)  $= \text{Sb}_4\text{O}_6$  (g),  $Q = -47.32$ ; and  $2\text{Sb}_2\text{O}_3$  (liq.)  $= \text{Sb}_4\text{O}_6$  (g),  $Q = -17.83$ .

**$\text{Sb}_4\text{O}_6$  (liq.).** The vapor pressure data of Hincke<sup>1</sup> yield  $-13.6$  for the heat of fusion of  $\text{Sb}_2\text{O}_3$  (c, orthorhombic).

**$\text{SbO}$  (g).** Mukherji<sup>1</sup> reported  $D^\circ = -81$ .

**$\text{Sb}_2\text{O}_4$  (c).** The data of Simon and Thaler<sup>1</sup> give  $2\text{Sb}_2\text{O}_4$  (c)  $= 2\text{Sb}_2\text{O}_3$  (c)  $+ \text{O}_2$  (g),  $Q^{1080} = -55.8$ ; whence, for  $\text{Sb}_2\text{O}_4$  (c),  $Q_f=193.3$ . Mixer<sup>9</sup> measured the heat of the reaction of antimony and antimony tetroxide with sodium peroxide, and his data yield, for  $\text{Sb}_2\text{O}_4$  (c),  $Q_f=213.0$ .

**$\text{Sb}_6\text{O}_{13}$  (c).** The data of Simon and Thaler<sup>1</sup> give  $3\text{Sb}_2\text{O}_5$  (c)  $= \text{Sb}_6\text{O}_{13}$  (c)  $+ \text{O}_2$  (g),  $Q^{400} = -25.5$ , and  $2\text{Sb}_6\text{O}_{13}$  (c)  $= 6\text{Sb}_2\text{O}_4$  (c)  $+ \text{O}_2$  (g),  $Q^{730} = -39.3$ . These values yield, for  $\text{Sb}_6\text{O}_{13}$  (c),  $Q_f=664.5$  and  $658.7$ , respectively.

**$\text{H}_3\text{SbF}_6$  (aq.).** Guntz<sup>7, 1, 6, 7</sup> data on the heat of solution of  $\text{Sb}_2\text{O}_3$  (c, orthorhombic) in aqueous HF yield, for  $\text{H}_3\text{SbF}_6$  (aq.),  $Q_f=443.5$ .

**$\text{SbF}_3$  (c).** Guntz<sup>7, 1, 6, 7</sup> measured the heat of solution of  $\text{SbF}_3$  (c) in 3 HF (aq.) to be 0.3.

**$\text{SbF}_3$  (aq.).** Guntz<sup>7, 1, 6, 7</sup> measured the heat of solution of  $\text{SbF}_3$  (c) in water to be  $-1.6_{200}^9$ .

**$\text{Sb}_4\text{O}_5\text{Cl}_2$  (c).** Thomsen's<sup>15</sup> data on the heat of solution of  $\text{SbCl}_3$  (c) in water to form  $\text{Sb}_4\text{O}_5\text{Cl}_2$  (c) and 10 HCl (aq.) yield, for  $\text{Sb}_4\text{O}_5\text{Cl}_2$  (c),  $Q_f=348.40$ . Guntz<sup>7, 1</sup> measured the heat of solution of  $\text{Sb}_4\text{O}_5\text{Cl}_2$  (c) in aqueous HF but reported no experimental data. He computed for the reaction,  $2\text{Sb}_2\text{O}_3$  (c, orthorhombic)  $+ 2\text{HCl}$  (g)  $= \text{Sb}_4\text{O}_5\text{Cl}_2$  (c)  $+ \text{H}_2\text{O}$  (c),  $Q=41.2$ ; whence, for  $\text{Sb}_4\text{O}_5\text{Cl}_2$  (c),  $Q_f=346.1$ .

**$\text{SbOCl}$  (c).** Guntz<sup>7, 1</sup> measured the heat of solution of  $\text{SbOCl}$  (c) in aqueous HF, but reported no experimental data. He computed for the

reaction,  $\text{Sb}_2\text{O}_3$  (c, orthorhombic) +  $2 \text{HCl}$  (g) =  $2 \text{SbOCl}$  (c) +  $\text{H}_2\text{O}$  (c),  $Q = 38.8$ ; whence, for  $\text{SbOCl}$  (c),  $Q_f = 89.2$ .

$\text{SbF}_3 \cdot n \text{NH}_3$  (c). Biltz and Rahlfs<sup>2</sup> measured the dissociation pressures at various temperatures of the ammines with 1, 2, 3, 4, and 6 moles of  $\text{NH}_3$ .

$\text{SbBr}_3$  (c). Guntz<sup>1, 7</sup> measured the heat of solution of  $\text{SbBr}_3$  in  $\text{HF}$ , but did not report the result of this experiment. Instead he gave  $Q = 76.9$  for the reaction,  $\text{Sb}$  (c) +  $\frac{3}{2} \text{Br}_2$  (g) =  $\text{SbBr}_3$  (c). Making some assumptions as to the auxiliary data Guntz used in arriving at this value, we have computed, for  $\text{SbBr}_3$  (c),  $Q_f = 64.1$ . Berthelot and Petit<sup>1</sup> dissolved  $\text{SbBr}_3$  (c) in concentrated aqueous  $\text{HCl} + \text{Br}_2$ , finding  $Q = 27.5$ . Assuming that  $\text{H}_3\text{SbO}_4$  (aq.) was formed, we have deduced, for  $\text{SbBr}_3$  (c),  $Q_f = 55.5$ , which value is evidently too small. Combining the data of Cohen and Strengers<sup>1</sup> on the reactions,  $\text{SbBr}_3$  (c) =  $\text{SbBr}_3$  ( $\text{CS}_2$ ),  $Q = -3.6$ , and  $\text{Sb}$  (c, trigonal) +  $\frac{3}{2} \text{Br}_2$  ( $\text{CS}_2$ ) =  $\text{SbBr}_3$  ( $\text{CS}_2$ ),  $Q = 58.5$ , we have obtained, for  $\text{SbBr}_3$  (c),  $Q_f = 60.0$ .

$\text{SbBr}_3$  (liq.). Tolloczko and Meyer<sup>1</sup> and Tolloczko<sup>1</sup> gave  $-3.52^{100}$  for the heat of fusion of the solid. Rideal<sup>1</sup> calculated  $-3.60$ .

$\text{SbBr}_3$  ( $\text{CS}_2$ ). Cohen and Strengers<sup>1</sup> measured the heat of formation of  $\text{SbBr}_3$  in carbon disulfide from antimony and bromine,  $\text{Sb}$  (c, trigonal) +  $\frac{3}{2} \text{Br}_2$  ( $\text{CS}_2$ ) =  $\text{SbBr}_3$  ( $\text{CS}_2$ ), to be 58.5; whence, for  $\text{SbBr}_3$  ( $\text{CS}_2$ ),  $Q_f = 56.4$ .

$\text{SbI}_3$  (c). Guntz<sup>8</sup> gave 45.4 for the heat of the reaction,  $\text{Sb}$  (c, trigonal) +  $\frac{3}{2} \text{I}_2$  (g) =  $\text{SbI}_3$  (c), which he deduced from measurement of the heat of solution of  $\text{SbI}_3$  (c) in aqueous  $\text{HF}$ . Making assumptions as to the subsidiary values used by Guntz,<sup>8</sup> we have obtained, for  $\text{SbI}_3$  (c),  $Q_f = 22.8$ .

$\text{SbI}_3$  (aq.). Mosnier<sup>1</sup> measured the heat of solution of  $\text{SbI}_3$  (c) in water to be  $-0.88$ .

$\text{SbH}_3$  (g). The data of Berthelot and Petit,<sup>1</sup> who measured the heat of solution of  $\text{SbH}_3$  (g) in bromine water, yield for  $\text{SbH}_3$  (g),  $Q_f = -79.5$ . Stock and Wrede<sup>1</sup> measured directly the heat of the explosive decomposition of gaseous  $\text{SbH}_3$  into solid  $\text{Sb}$  and gaseous  $\text{H}_2$ , and their data yield  $Q_f = -34.0$ .

$\text{Sb}_2\text{S}_3$  (c, yellow). Berthelot<sup>99</sup> found the heat of reaction of dilute aqueous  $\text{SbCl}_3$  with  $\text{H}_2\text{S}$  to be variable, and he ascribed this behavior to the formation of compounds similar to  $\text{SbSCl}$ . Berthelot<sup>99</sup> measured the heat of the reaction of  $\text{SbCl}_3$  (c) with  $6 \text{C}_4\text{H}_6\text{O}_6$  (aq.) and of the resulting solution with aqueous  $\text{H}_2\text{S}$ , finding  $Q = 13.74$  and  $32.26$ , respectively; whence, for  $\text{Sb}_2\text{S}_3$  (c, yellow),  $Q_f = 35.8$ . Berthelot<sup>99</sup> also found the heat of reaction of  $\text{SbCl}_3$  (c) with  $12 \text{HCl}$  (20) to be 4.17, and that of the resulting mixture with aqueous  $\text{H}_2\text{S}$  to be 9.39; whence, for  $\text{Sb}_2\text{S}_3$  (c, yellow),  $Q_f = 35.2$ .

$\text{Sb}_2(\text{SO}_4)_3$  (c). Beck<sup>1</sup> measured the heat of solution of this substance in aqueous  $\text{NaOH}$  to be 118.7.

## BISMUTH

**Bi (c).** Standard state.

**Bi (liq.).** The data on the heat of fusion of solid bismuth at the melting point,  $271^\circ$ , are: Person,<sup>9</sup>  $-2.59$ ; Person,<sup>2, 8</sup>  $-2.64$ ; Wust, Meuthen, and Durrer,<sup>1</sup>  $-2.14$ ; Iitaka,<sup>1</sup>  $-2.55$ ; Awbery and Griffiths,<sup>1</sup>  $-2.72$ . From the cooling curve, Mazzotto<sup>3</sup> deduced  $-2.59$ ; and, from data on the change in melting point with pressure, Bridgman<sup>4</sup> calculated  $-2.68$ . See also Tammann<sup>4</sup> and Johnston and Adams.<sup>1</sup>

**Bi<sub>2</sub> (g).** The vapor density data of Biltz and Meyer<sup>1, 3</sup> indicated that bismuth vapor at the boiling point is about  $\frac{1}{2}$  Bi<sub>2</sub> +  $\frac{1}{2}$  Bi. The vapor pressure data, for liquid bismuth, of Greenwood,<sup>3</sup> Ruff and Bergdahl,<sup>1</sup> Ruff and Mugdan,<sup>1</sup> and Barus<sup>1, 2</sup> yield  $-4.48$  for the heat of vaporization at the boiling point. We have corrected this value for the amount of dissociation.

**Bi (g).** From spectroscopic data, Barratt and Bonar<sup>1</sup> obtained, for Bi<sub>2</sub> (g) = 2 Bi (g),  $D^\circ = -18.5$ . The values for the energy states of gaseous monatomic bismuth are taken from the following: first spectra, Thomsen<sup>3</sup> and Toshniwal<sup>1</sup>; second and third spectra, McLennan, McLay, and Crawford.<sup>2</sup> See also Bacher and Goudsmit.<sup>1</sup>

**BiCl<sub>3</sub> (c).** Thomsen<sup>15</sup> measured the heat of reaction of solid bismuth and gaseous chlorine, and his data give, for BiCl<sub>3</sub> (c),  $Q_f = 90.61$ .

**BiCl<sub>3</sub> (aq. HCl).** Tanatar<sup>8</sup> measured the heat of solution of Bi<sub>2</sub>O<sub>3</sub> (c) in excess HCl (25) to be 35.6. Assuming the reaction to be Bi<sub>2</sub>O<sub>3</sub> (c) + 6 HCl (25) = 2 BiCl<sub>3</sub> (aq. HCl) + 3 H<sub>2</sub>O (liq.), we have computed, for BiCl<sub>3</sub> (aq. HCl),  $Q_f = 84.5$ .

**BiOCl (c).** Thomsen's<sup>15</sup> value for the heat of the reaction, BiCl<sub>3</sub> (c) + H<sub>2</sub>O (liq.) = BiOCl (c) + 2 HCl (aq.),  $Q = 7.83$ , yields, for BiOCl (c),  $Q_f = 87.8$ . Noyes and Chow<sup>1</sup> measured the electromotive force at various temperatures of the cell in which the reaction was Bi (c) + HCl (aq.) + H<sub>2</sub>O (liq.) = BiOCl (c) +  $\frac{3}{2}$  H<sub>2</sub> (g), and calculated  $Q = 18.50$ ; whence, for BiOCl (c),  $Q_f = 89.4$ .

**Bi<sub>2</sub>O<sub>3</sub> (c, hydrated).** Thomsen<sup>15</sup> measured the heat of reaction of Bi<sub>2</sub>O<sub>3</sub> · *n* H<sub>2</sub>O (c) with just enough aqueous HCl to form solid BiOCl to be 14.2, whence we have computed, for the hydrated oxide,  $Q_f = 136.8$ .

**H<sub>3</sub> BiO<sub>3</sub> (c).** Assuming the above hydrated oxide to be Bi<sub>2</sub>O<sub>3</sub> · 3 H<sub>2</sub>O (c), we have computed, for H<sub>3</sub>BiO<sub>3</sub> (c),  $Q_f = 171.1$ .

**Bi<sub>2</sub>O<sub>3</sub> (c).** Mixer<sup>9</sup> measured, in a bomb calorimeter, the following: 2 Bi (c) + 5 Na<sub>2</sub>O<sub>2</sub> (c) = 2 Na<sub>3</sub>BiO<sub>4</sub> (c) + 2 Na<sub>2</sub>O (c),  $Q = 170.6$ ; Bi<sub>2</sub>O<sub>3</sub> (c) + 2 Na<sub>2</sub>O<sub>2</sub> (c) + Na<sub>2</sub>O (c) = 2 Na<sub>3</sub>BiO<sub>4</sub> (c),  $Q = 92.8$ . The difference gives 2 Bi (c) + 3 Na<sub>2</sub>O<sub>2</sub> (c) = Bi<sub>2</sub>O<sub>3</sub> (c) + 3 Na<sub>2</sub>O (c),  $Q = 77.8$ ; from which, for Bi<sub>2</sub>O<sub>3</sub> (c),  $Q_f = 137.1$ .

**BiO (c).** Tanatar<sup>8</sup> measured the heat of solution of BiO (c) in excess aqueous HCl to be 24.6.

**Bi<sub>2</sub>S<sub>3</sub> (c).** From equilibrium data on the reaction, Bi<sub>2</sub>S<sub>3</sub> (c) + 3 H<sub>2</sub> (g) = 2 Bi (liq.) + 3 H<sub>2</sub>S (g), Jellinek and Zakowski<sup>1</sup> computed  $Q = -18.1$ ; whence, for Bi<sub>2</sub>S<sub>3</sub> (c),  $Q_f = 29$ .

$\text{Bi}_2(\text{SO}_4)_3$  (c). Beck<sup>1</sup> measured the heat of solution of this substance in aqueous NaOH to be 54.6.

$\text{BiI}_3$  (c). Mosnier<sup>1</sup> measured the heat of solution.

$\text{BiI}_3$  (aq.). We have estimated this value.

### CARBON

**C (c, diamond).** We have selected diamond as the standard state for carbon because, with respect to heat content, it is the only truly reproducible form of solid carbon.

**C (c, graphite).** Roth<sup>10</sup> found that the heat of combustion of graphite varies considerably with its source or manner of preparation. The results obtained by Roth,<sup>9, 10</sup> Roth and Wallasch,<sup>1</sup> and Roth and Naeser<sup>1</sup> for the heats of combustion of graphite grouped themselves about two values; and Roth labeled those samples having the lower heat of combustion  $\alpha$  graphite, and those having the higher heat of combustion  $\beta$  graphite. The differences in the values found by Roth and his coworkers for the heats of combustion of diamond,  $\alpha$  graphite, and  $\beta$  graphite, when properly converted to true moles (see Rossini<sup>15</sup>) and to a pressure of 1 atmosphere (see Washburn<sup>2</sup>) yield 0.22 and 0.49 for the heats of transition at 18° of diamond to  $\beta$  graphite and to  $\alpha$  graphite, respectively. The data of Roth,<sup>9, 10</sup> Roth and Wallasch,<sup>1</sup> and Roth and Naeser<sup>1</sup> yield 94.45, 94.23, and 93.96 for the heats of the reaction,  $\text{C (c)} + \text{O}_2 (\text{g}) = \text{CO}_2 (\text{g})$ , for diamond,  $\beta$  graphite, and  $\alpha$  graphite, respectively, at 18° and a constant pressure of 1 atmosphere. The uncertainty in these values is apparently about  $\pm 0.10$ . Though some investigators used graphite degassed in air, Plummer<sup>1</sup> reported that such samples of graphite were partially oxidized. The older data on the heat of combustion of graphite are those of Favre and Silbermann,<sup>1</sup> Andrews,<sup>16</sup> Grassi,<sup>1</sup> Berthelot and Petit,<sup>2</sup> and Mixter.<sup>3</sup>

**C (c, carbonado).** Roth and Naeser<sup>1</sup> measured the heat of combustion of carbonado (bort or black diamond), and their data yield for the reaction,  $\text{C (c, carbonado)} + \text{O}_2 (\text{g}) = \text{CO}_2 (\text{g})$ ,  $Q = 94.55$ .

**C ("amorphous," charcoal).** Thiele<sup>1</sup> studied the heat of combustion of charcoal prepared from sugar as a function of the temperature of preparation, and found that the heat of combustion was constant only for samples prepared above 1400°. The data of Thiele,<sup>1</sup> Mixter,<sup>3</sup> and Favre and Silbermann,<sup>1, 5, 11</sup> yield, respectively, 96.4, 96.6, and 96.4 for the heat of the reaction,  $\text{C ("amorphous," charcoal)} + \text{O}_2 (\text{g}) = \text{CO}_2 (\text{g})$ . Data on the heat of combustion of this form of carbon were also reported by Peterson,<sup>1a</sup> Despretz,<sup>1</sup> Berthelot and Petit,<sup>2</sup> Dulong,<sup>2</sup> Andrews,<sup>14, 16</sup> Berthelot and Vielle,<sup>7, 12</sup> Ruff and Gersten,<sup>2</sup> Thomsen,<sup>7, 16</sup> Pfaundler,<sup>3</sup> Nikiten,<sup>1</sup> and Lavoisier and Laplace<sup>1</sup> (see Mellor<sup>1</sup>).

**C ("amorphous," "acetylene" carbon).** Mixter's data yield 94.7 for the heat of the reaction,  $\text{C ("amorphous," "acetylene" carbon)} + \text{O}_2 (\text{g}) = \text{CO}_2 (\text{g})$ .

**C ("amorphous," "Glanzkohlenstoff").** Roth and Doepke<sup>1</sup> measured the heats of combustion of samples of "Glanzkohlenstoff" of different

densities, and their data yield the following values for the heats of formation, from diamond as the standard state, of samples having the densities 2.07, 2.0, and 1.86 grams per cm<sup>3</sup>, respectively: -2.1, -2.3, and -3.2. See also Roth, Naeser, and Doepke.<sup>1</sup>

**C ("amorphous," "gas" carbon).** Roth<sup>9</sup> and Favre and Silbermann<sup>1</sup> measured the heat of combustion of this form of carbon, and their data yield for the reaction, C ("amorphous," "gas" carbon) + O<sub>2</sub> (g) = CO<sub>2</sub> (g),  $Q = 95.93$  and  $96.5$ , respectively.

**C<sub>2</sub> (g).** The values for the energy of dissociation of C<sub>2</sub> (g) into 2C (g), with each substance in the normal or ground state, are, in volt-electrons, the following: Mulliken,<sup>3</sup> 5.5; Birge,<sup>1</sup> 7.0; Johnson and Asundi,<sup>2</sup> 7.02; Vaughan and Kistiakowsky,<sup>1</sup> 7.43, 8.28, 6.78, and 6.97. The value for the energy of excitation of C<sub>2</sub> (g) is from Mulliken.<sup>3</sup> See also Hori<sup>2</sup> and Lennard-Jones.<sup>1</sup>

**C (liq.).** Ryschkewitsch<sup>1, 2</sup> and Ryschkewitsch and Merck<sup>1</sup> obtained values for the vapor pressures of solid and liquid carbon at various temperatures by assuming that the partial pressure of gaseous carbon in the crater is equal to the external pressure. Their data on the difference in the slopes of the curves giving the logarithm of the pressure against the reciprocal of the absolute temperature for both solid and liquid carbon yield -11 for the heat of fusion of carbon at the melting point. Fajans<sup>6</sup> estimated the value to be -10. There is now general agreement (see Ryschkewitsch,<sup>1, 2</sup> Hagenback and Luthy,<sup>1</sup> Sauerwold,<sup>1</sup> Despretz,<sup>3, 4</sup> Braun,<sup>1</sup> La Rosa,<sup>1</sup> Lummer,<sup>1</sup> Ruff,<sup>1</sup> and Munch<sup>1</sup>) that the melting point of carbon is about 3580°.

**C (g).** The heat of formation of gaseous monatomic carbon can be computed from values of the heat of sublimation of carbon or of the energy of dissociation of gaseous CO into gaseous carbon and oxygen atoms.

Values for the heat of sublimation of carbon have been determined in three ways: (1), by estimation of the heat of vaporization from the boiling point and Trouton's constant, and combination with the heat of fusion; (2), by experimental determination of the vapor pressure at various temperatures, assuming that the partial pressure of gaseous carbon in the carbon arc is equal to the external pressure of the inert gas; (3), by experimental determination of the vapor pressure at various temperatures by measuring the rate of loss of carbon from a carbon filament heated to known temperatures, assuming an accommodation coefficient of 1. In each of these three methods there is required a knowledge of the relative concentrations of C<sub>2</sub> (g) and C (g) in the gaseous carbon, and of the energy of dissociation of C<sub>2</sub> (g) into 2C (g), in order that the heat of the reaction C (c) = C (g) may be calculated. Vaughan and Kistiakowsky<sup>1</sup> calculated that, if the energy of dissociation of C<sub>2</sub> (g) into 2C (g) is -160, the concentration of C (g) in gaseous carbon is 9.7 mole per cent at 3880° and 12.7 mole per cent at 4430°.

Calculation of the heat of sublimation of carbon at 18° from values

for the boiling point and Trouton's constant yields values ranging from  $-150$  to  $-200$ . The various published values for the boiling point of carbon range from  $3900$  to  $5680^\circ$ . Johnston, Fenwick, and Leopold<sup>1</sup> estimated the value  $3930 \pm 100^\circ$ , from a review of the then-published vapor pressure data. Other estimates are the following: Ryschkewitsch,<sup>2</sup>  $3900^\circ$ ; Kohn and Guckel,<sup>1, 2</sup>  $3930^\circ$ ; Fajans,<sup>1, 2, 7</sup>  $4050^\circ$ ; Herbst,<sup>1</sup> not less than  $5700^\circ$ ; van Laar,<sup>8</sup>  $5030^\circ$ . See also Crookes,<sup>1</sup> Violle,<sup>5</sup> Moissan,<sup>3</sup> Mott,<sup>1</sup> and van Laar.<sup>1, 3, 6, 7</sup>

Data on the change in vapor pressure of carbon with temperature, obtained by assuming the partial pressure of gaseous carbon in the carbon arc equal to the external pressure of the inert gas, were reported by Fajans,<sup>1, 7</sup> Kohn,<sup>1</sup> Kohn and Guckel,<sup>1, 2</sup> Thiele and Ritter,<sup>1</sup> Ryschkewitsch,<sup>2</sup> and Podszus.<sup>1</sup> These data yield values ranging from  $-140$  to  $-190$  for the heat of sublimation of carbon at  $18^\circ$ .

Data on the change in vapor pressure of carbon with temperature, obtained by measuring the rate of loss of carbon from a carbon filament heated to known temperatures, were reported by Wertenstein and Jedrzejewski,<sup>1</sup> Brody and Millner,<sup>1, 2</sup> and Marshall and Norton.<sup>1</sup> These data yield values ranging from  $-160$  to  $-210$  for the heat of sublimation of carbon at  $18^\circ$ . Marshall and Norton<sup>1</sup> computed from their data the value  $-178 \pm 1$  for the heat of the reaction,  $C(c, \text{graphite}) = C(g)$ , at  $-273^\circ$ .

Estimates of the heat of sublimation of carbon were made by Violle,<sup>2, 3, 4</sup> Wilson,<sup>4</sup> Wilson and Fitzgerald,<sup>1</sup> Wanner,<sup>1</sup> Watts and Mendenhall,<sup>1</sup> Lummer,<sup>1</sup> Fajans,<sup>7</sup> Smithells,<sup>1</sup> Weimberg,<sup>1</sup> Gruneisen,<sup>1</sup> Padoa,<sup>1</sup> and Lande.<sup>2</sup> Most of the foregoing data were reviewed by Johnston, Fenwick, and Leopold,<sup>1</sup> who gave  $-129$  for the heat of vaporization of liquid carbon in the range  $3900$  to  $4400^\circ$ .

Vaughan and Kistiakowsky<sup>1</sup> calculated by the statistical method, on the assumption that the published experimentally determined vapor pressures (but not the corresponding temperatures) of carbon were correct, that the heat of sublimation of carbon into gaseous atoms at  $-273^\circ$  is  $-161$  or  $-195$ , depending upon whether the value  $5.5$  or  $7.0$  volt-electrons is taken as the energy of dissociation of  $C_2(g)$  into  $2C(g)$ .

Birge and Sponer<sup>1</sup> extrapolated the vibrational levels of CO (from band spectra) and their data yield  $10.2$  volt-electrons for the energy of dissociation of CO. For this same quantity, Mulliken<sup>6</sup> estimated  $10.0$  and Wiezel<sup>1</sup>  $10.3$  volt-electrons. Coster and Brons<sup>1</sup> obtained predissociation data in the  $0-1$  Angstrom band of CO, and, assuming the products of dissociation of CO in the B state to be carbon and oxygen atoms each in the  $^1D$  state, deduced the energy of dissociation of CO to be  $9.82$  volt-electrons. The assumption that the products of dissociation are  $C(^1D)$  and  $O(^3P)$  yields the value of  $11.06$  volt-electrons. These predissociation data were confirmed by Read,<sup>1</sup> who set an upper limit of  $11.05$  volts for the energy of dissociation of CO. From electron bombardment experiments, Tate and Lozier<sup>1</sup> deduced  $9.3 \pm 0.5$  volt-electrons for the

energy of dissociation of CO. The similar, but later and more accurate, data of Lozier<sup>2</sup> were subjected to two interpretations, one yielding the value  $9.6 \pm 0.1$  and the other  $11.6 \pm 0.1$  volt-electrons.

Because of the existing uncertainties in the data leading to the heat of formation of gaseous monatomic carbon, we have arbitrarily selected for the energy of dissociation of normal CO (g) into normal C (g) and O (g), the value  $D^{\circ} = 11.06 - a'$  volt-electrons, or  $-255.0 + a$  kilocalories per mole, where  $a$  is an unknown whose value at this writing may be as much as +60 kilocalories, so that, for C (g),  $-110 > Q_f > -170$ .

The energy states of gaseous monatomic carbon are evaluated from the data of Fowler and Selwyn,<sup>1, 2</sup> Bowen,<sup>2</sup> Edlen,<sup>2</sup> Edlen and Stemnan,<sup>1</sup> Edlen and Ericson,<sup>5</sup> Eckart,<sup>1</sup> and Paschen and Kruger.<sup>1</sup>

**CO (g).** The heat of combustion of carbon monoxide was measured by Andrews,<sup>14</sup> Grassi,<sup>2</sup> Lagerlof,<sup>1</sup> Dulong,<sup>2</sup> Favre and Silbermann,<sup>1</sup> Berthelot,<sup>45, 58</sup> Berthelot and Matignon,<sup>11</sup> Thomsen,<sup>7, 10, 15, 16</sup> Rossini,<sup>2, 5</sup> Roth and Banse,<sup>2</sup> Fenning and Cotton,<sup>1</sup> and Awbery and Griffiths.<sup>2</sup> The last four named investigations were completed in the years 1930 to 1933, and all the others prior to 1904. The data of the modern determinations yield the following values for the heat of the reaction,  $\text{CO (g)} + \frac{1}{2} \text{O}_2 \text{ (g)} = \text{CO}_2 \text{ (g)}$ , at  $18^{\circ}$  and a constant pressure of 1 atmosphere: Rossini,<sup>2, 5</sup>  $67.61 \pm 0.03$ ; Roth and Banse,<sup>2</sup>  $67.86 \pm 0.20$ ; Fenning and Cotton,<sup>1</sup>  $67.65 \pm 0.05$ ; Awbery and Griffiths,<sup>1</sup>  $67.58 \pm 0.10$ .

The energy states of CO (g) are evaluated from the data of Hund,<sup>1</sup> Mulliken,<sup>3</sup> Johnson,<sup>4</sup> Dunkel,<sup>1</sup> Birge,<sup>6, 7</sup> Hopfield and Birge,<sup>1</sup> Duffendack and Fox,<sup>2</sup> Knauss,<sup>1</sup> Herzberg,<sup>2</sup> Johnson and Asundi,<sup>1</sup> Asundi,<sup>1, 2</sup> Eastey,<sup>1</sup> Hepburn,<sup>1</sup> Kallman and Rosen,<sup>1</sup> Hogness and Harkness,<sup>1</sup> Dunkel,<sup>1</sup> and Birge and Spomer.<sup>1</sup>

**CO (liq.).** Vapor pressure data on liquid carbon monoxide were reported by Olszewsky,<sup>7, 8</sup> Wroblewsky,<sup>1, 5, 2</sup> Baly and Donnan,<sup>1</sup> Clusius and Teske,<sup>1</sup> Hoppel,<sup>1</sup> Verschoyle,<sup>1</sup> Crommelin, Bijleveld, and Brown,<sup>1</sup> and Clayton and Giauque.<sup>1</sup> The calorimetric data on the heat of vaporization of liquid carbon monoxide are: Eucken,<sup>2, 3</sup>  $-1.414$  at  $-190^{\circ}$ ; Clayton and Giauque,<sup>1</sup>  $-1.444$  at  $-191.5^{\circ}$ .

**CO (c).** Vapor pressure data on solid carbon dioxide were reported by Olszewsky,<sup>7, 8</sup> Wroblewsky,<sup>1, 5, 2</sup> Baly and Donnan,<sup>1</sup> Clusius and Teske,<sup>1</sup> Hoppel,<sup>1</sup> Verschoyle,<sup>1</sup> Crommelin, Bijleveld, and Brown,<sup>1</sup> and Clayton and Giauque.<sup>1</sup> The calorimetric data on the heat of fusion of CO (c, I) are: Eucken,<sup>2, 3</sup>  $-0.224$  at  $-205.8^{\circ}$ ; Clusius,<sup>2</sup>  $-0.2015$  at  $-204.9^{\circ}$ ; Clayton and Giauque,<sup>1</sup>  $-0.1997$  at  $-205.0^{\circ}$ . The calorimetric data on the heat of transition of CO (c, II) to CO (c, I) are Eucken,<sup>2, 3</sup>  $-0.144$  at  $-212.9^{\circ}$ ; Clusius,<sup>2</sup>  $-0.1512$  at  $-211.6^{\circ}$ ; Clayton and Giauque,<sup>1</sup>  $-0.1515$  at  $-211.6^{\circ}$ .

**CO (aq.).** Adolph and Henderson<sup>1</sup> calculated the heat of solution of gaseous carbon monoxide in water from the solubility-temperature data of Winkler<sup>8</sup> and Bunsen.<sup>1</sup>

**CO<sub>2</sub> (g).** The heat of combustion of diamond was measured by Ber-

thelot and Petit,<sup>2, 6</sup> Favre and Silbermann,<sup>1, 4, 5, 11</sup> Andrews,<sup>2, 7, 16</sup> Roth and Wallasch,<sup>1</sup> and Roth and Naeser.<sup>1</sup> The modern data, those of Roth and his coworkers, yield 94.45 for the heat of the reaction, C (c, diamond) + O<sub>2</sub> (g) = CO<sub>2</sub> (g).

CO<sub>2</sub><sup>+</sup> (g). Smyth and Steuckelberg<sup>1</sup> reported a value for the energy of the reaction, CO<sub>2</sub> (g) = CO<sub>2</sub><sup>+</sup> (g) +  $\theta$ .

CO<sub>2</sub> (liq.). Liquid carbon dioxide does not exist at a pressure of 1 atmosphere. The heat of vaporization of liquid carbon dioxide was measured by Chappuis<sup>1, 2</sup> and Mathias.<sup>1</sup> Vapor pressure data on liquid carbon dioxide were reported by Faraday,<sup>3</sup> Regnault,<sup>6</sup> Mollier,<sup>1</sup> Amagat,<sup>1, 2, 3</sup> Tate,<sup>2</sup> Balserna,<sup>1</sup> Cailletet,<sup>3</sup> DuBois and Wills,<sup>1</sup> Verschaffelt,<sup>1</sup> Villard and Jarry,<sup>1</sup> Zeleny and Smith,<sup>1</sup> Antoine,<sup>2</sup> Jarolimek,<sup>1, 2, 3, 4</sup> Andrews,<sup>17</sup> Keyes and Kenney,<sup>1</sup> Kuenen and Robson,<sup>1</sup> Meyers and Van Dusen,<sup>1</sup> Scheffer,<sup>2</sup> von Siemens,<sup>1</sup> Stock, Henning, and Kuss,<sup>1</sup> Villard,<sup>1</sup> and Jenkins and Pye.<sup>1, 2</sup>

CO<sub>2</sub> (c). Calorimetric data on the heat of sublimation of solid carbon dioxide were reported by Andrews,<sup>3</sup> Favre and Silbermann,<sup>3</sup> Behn,<sup>1</sup> and Eucken and Donath.<sup>1</sup> Vapor pressure data on solid carbon dioxide were reported by Faraday,<sup>3</sup> Dubois and Wills,<sup>1</sup> Henning,<sup>3</sup> Henning and Stock,<sup>1</sup> Kuenen and Robson,<sup>1</sup> Onnes and Weber,<sup>2</sup> von Siemens,<sup>1</sup> Stock, Henning, and Kuss,<sup>1</sup> Homfray,<sup>1</sup> Villard and Jarry,<sup>1</sup> and Zeleny and Smith.<sup>1, 2</sup>

CO<sub>2</sub> (aq.). The calorimetric data on the heat of solution of CO<sub>2</sub> (g) in water are: Thomsen,<sup>15</sup> 5.88<sub>1500</sub>; Berthelot,<sup>7</sup> 5.6; Adolph and Henderson,<sup>1</sup> 4.69. The data on the solubility of carbon dioxide in water at various temperatures yield 4.76.

CO<sub>2</sub> · 6H<sub>2</sub>O (c). The data of Villard<sup>2, 10</sup> and Wroblewsky<sup>3</sup> yield -8.3 for the heat of the reaction, CO<sub>2</sub> · 6H<sub>2</sub>O (c) = CO<sub>2</sub> (aq.) + 6H<sub>2</sub>O (liq.), at 0°.

CO<sub>3</sub><sup>-</sup> (∞). The value for aqueous carbonate ion at infinite dilution is obtained from those for aqueous lithium, sodium, and potassium carbonates at infinite dilution.

CO<sub>3</sub><sup>-</sup> (g). The lattice energy calculations of Lennard-Jones and Dent<sup>1, 2</sup> on the carbonates of zinc, cadmium, calcium, and magnesium yield, for CO<sub>3</sub><sup>-</sup> (g),  $Q_f = -75 \pm 10$ .

C<sub>2</sub>O<sub>4</sub><sup>-</sup> (aq.). The value for aqueous oxalate ion is obtained from those for aqueous sodium and potassium oxalates.

C<sub>3</sub>O<sub>2</sub> (liq.). Vapor pressure data were reported by Stock and Stolzenberg.<sup>1</sup>

CH (g). The value for the energy of dissociation of CH (g) into gaseous carbon and hydrogen atoms is obtained from the data of Mulliken,<sup>5</sup> Kratzer,<sup>2</sup> Hori,<sup>4</sup> and Villars.<sup>1</sup> The values for the energy states of CH (g) are from Mulliken.<sup>5</sup>

CH<sub>3</sub><sup>+</sup> (g). The data of Hogness and Kvalnes<sup>1</sup> (see also Pietsch and Wilcke<sup>1</sup>) yield a value for the energy of the reaction, CH<sub>4</sub> (g) = CH<sub>3</sub><sup>+</sup> (g) + H (g) +  $\theta$ .

**CH<sub>4</sub> (g).** The heat of combustion of methane was measured by Andrews,<sup>14</sup> Favre and Silbermann,<sup>1</sup> Thomsen,<sup>15</sup> Berthelot and Matignon,<sup>7</sup> Roth and Banse,<sup>2</sup> and Rossini.<sup>2, 5</sup> Mixer<sup>1</sup> made two experiments on the heat of decomposition of methane into carbon and hydrogen by exploding a mixture of acetylene, methane, and hydrogen in a bomb. The modern data yield the following values for the heat of the reaction,  $\text{CH}_4(\text{g}) + 2\text{O}_2(\text{g}) = \text{CO}_2(\text{g}) + 2\text{H}_2\text{O}(\text{liq.})$ , at 18° and a constant pressure of 1 atmosphere: Roth and Banse,<sup>2</sup>  $213.27 \pm 0.64$ ; Rossini,<sup>2, 5</sup>  $212.95 \pm 0.07$ .

**CH<sub>4</sub><sup>+</sup> (g).** The value for the energy of ionization of CH<sub>4</sub> (g) is obtained from the data of Pietsch and Wilcke,<sup>1</sup> Glockler,<sup>1</sup> Morris,<sup>1</sup> Mayer,<sup>1</sup> Hughes and Klein,<sup>1</sup> and Pietsch.<sup>1</sup>

**CH<sub>4</sub> (liq.).** Vapor pressure data on liquid methane were reported by Keyes, Taylor, and Smith,<sup>1</sup> Crommelin,<sup>6</sup> Homfray,<sup>1</sup> and Stock, Henning, and Kuss.<sup>1</sup> See also Satterly and Patterson.<sup>1</sup>

**CH<sub>4</sub> (c).** Vapor pressure data on solid methane were reported by Karwat<sup>1</sup> and Freeth and Verschoyle.<sup>1</sup> The calorimetric data on the heat of fusion are: Eucken and Karwat,<sup>1</sup>  $-0.23$  at  $-182^\circ$ ; Clusius,<sup>2</sup>  $-0.224$  at  $-182.5^\circ$ . Clusius<sup>2</sup> measured the heat of transition at  $-252.7^\circ$ .

**CH<sub>4</sub> · 6H<sub>2</sub>O (c).** The dissociation pressure data of Villard<sup>2, 10</sup> yield  $-14.2$  for the heat of the reaction,  $\text{CH}_4 \cdot 6\text{H}_2\text{O}(\text{c}) = \text{CH}_4(\text{g}) + 6\text{H}_2\text{O}(\text{liq.})$ .

**C<sub>2</sub>H<sub>2</sub> (g).** The heat of combustion of acetylene was measured by Berthelot,<sup>71</sup> Berthelot and Matignon,<sup>8</sup> Thomsen,<sup>15</sup> and Mixer.<sup>4</sup> The data of the latter two investigations yield the following values for the heat of combustion of acetylene: Thomsen,<sup>15</sup>  $309.8 \pm 1.5$ ; Mixer,<sup>4</sup>  $312.5 \pm 2.5$ . Hence, for C<sub>2</sub>H<sub>2</sub> (g),  $Q_f = -52.5 \pm 1.5$  and  $-55.2 \pm 2.5$ , respectively. Mixer<sup>4</sup> also measured the heat of decomposition of acetylene into "acetylene" carbon and hydrogen. His data yield for the reaction,  $\text{C}_2\text{H}_2(\text{g}) = 2\text{C}$  ("amorphous," "acetylene" carbon) + H<sub>2</sub>(g),  $Q = 53.3 \pm 0.1$ ; whence, for C<sub>2</sub>H<sub>2</sub> (g),  $Q_f = -53.9 \pm 0.2$ . See also Berthelot<sup>32</sup> and Berner.<sup>3</sup>

**C<sub>2</sub>H<sub>2</sub> (liq.).** Acetylene does not exist as a liquid at a pressure of 1 atmosphere. Vapor pressure data on liquid acetylene were obtained by McIntosh,<sup>1</sup> Cardoso and Baum,<sup>1</sup> Kuenen,<sup>2</sup> Villard,<sup>1</sup> Ansdell,<sup>2</sup> Ladenburg and Krugel,<sup>2</sup> Hunter,<sup>1</sup> and Cailletet.<sup>1</sup> McIntosh<sup>1</sup> reported a value for the heat of vaporization at the triple point,  $-81.5^\circ$ .

**C<sub>2</sub>H<sub>2</sub> (c).** Solid acetylene has a vapor pressure of 1 atmosphere at  $-84.0^\circ$ . Vapor pressure data on solid acetylene were reported by McIntosh,<sup>1</sup> Cardoso and Baum,<sup>1</sup> Kuenen,<sup>2</sup> Villard,<sup>1</sup> Ansdell,<sup>2</sup> Ladenburg and Krugel,<sup>2</sup> Hunter,<sup>1</sup> and Cailletet.<sup>1</sup> McIntosh<sup>1</sup> reported a value for the heat of sublimation and the heat of fusion.

**C<sub>2</sub>H<sub>2</sub> (aq.).** Villard<sup>7</sup> reported the heat of solution of acetylene in water to be 5.3. The solubility-temperature data of Winkler<sup>5</sup> yield 4.0.

**C<sub>2</sub>H<sub>2</sub> · 6H<sub>2</sub>O (c).** Villard<sup>6</sup> determined the heats of the reactions  $\text{C}_2\text{H}_2 \cdot 6\text{H}_2\text{O}(\text{c}) = \text{C}_2\text{H}_2(\text{aq.}) + 6\text{H}_2\text{O}(\text{liq.})$ , and  $\text{C}_2\text{H}_2 \cdot 6\text{H}_2\text{O}(\text{c}) = \text{C}_2\text{H}_2(\text{g}) + 6\text{H}_2\text{O}(\text{liq.})$ , to be  $-10.1$  and  $-15.4$ , respectively, at  $0^\circ$ ; whence, for C<sub>2</sub>H<sub>2</sub> · 6H<sub>2</sub>O (c),  $Q_f = 370.6$  and  $371.9$ .

$(C_2H_2)_3$  (g). Sameshima and Fukaya<sup>1</sup> reported  $Q = -3.03$  for the heat of dissociation of the polymer of acetylene,  $(C_2H_2)_3$  (g) =  $3C_2H_2$  (g).

$C_2H_4$  (g). The heat of combustion of ethylene was measured by Dulong,<sup>2</sup> Grassi,<sup>1</sup> Favre and Silbermann,<sup>1</sup> Andrews,<sup>14</sup> Berthelot,<sup>71</sup> Berthelot and Matignon,<sup>8</sup> Thomsen,<sup>15</sup> and Mixer.<sup>1</sup> The data of the last four named investigations yield the following values for the heat of the reaction,  $C_2H_4$  (g) +  $3O_2$  (g) =  $2CO_2$  (g) +  $2H_2O$  (liq.): Berthelot,<sup>71</sup>  $341.3 \pm 2.2$ ; Berthelot and Matignon,<sup>8</sup>  $341.2 \pm 1.3$ ; Thomsen,<sup>15</sup>  $333.1 \pm 0.8$ ; Mixer,  $344.5 \pm 2.3$ . These values yield, for  $C_2H_4$  (g),  $Q_f = -15.7 \pm 2.2$ ,  $-15.6 \pm 1.3$ ,  $-7.5 \pm 0.8$ , and  $-18.9 \pm 2.3$ , respectively. Mixer<sup>1</sup> also performed three experiments involving the explosion of a mixture acetylene and ethylene. His data yield for the reaction,  $C_2H_4$  (g) =  $2C$  ("amorphous," "acetylene" carbon) +  $2H_2$  (g),  $Q = -15.1 \pm 4.0$ ; whence, for  $C_2H_4$  (g),  $Q_f = -15.7 \pm 4.0$ . von Wartenberg and Krause<sup>1</sup> measured the heat of hydrogenation of ethylene to form ethane. Their data yield  $Q = 30.6 \pm 0.4$  for the reaction,  $C_2H_4$  (g) +  $H_2$  (g) =  $C_2H_6$  (g); whence, for  $C_2H_4$  (g),  $Q_f = -9.6 \pm 0.4$ .

$C_2H_4$  (liq.),  $C_2H_4$  (c). Vapor pressure data were reported by Faraday,<sup>3</sup> Dewar,<sup>2</sup> Cailletet,<sup>2</sup> Olszewski,<sup>6, 11</sup> Witkowski,<sup>1</sup> Ladenburg and Krugel,<sup>1</sup> Hunter,<sup>1</sup> Villard,<sup>1</sup> Cardoso and Arni,<sup>1</sup> Burrell and Robertson,<sup>2</sup> Maass and Wright,<sup>1</sup> Henning and Stock,<sup>1</sup> and Britton.<sup>1</sup>

$C_2H_4 \cdot 6H_2O$  (c). Villard<sup>6</sup> reported  $Q = -15.4$  for the reaction,  $C_2H_4 \cdot 6H_2O$  (c) =  $C_2H_4$  (g) +  $6H_2O$  (liq.)

$C_2H_6$  (g). The heat of combustion of ethane was measured by Berthelot,<sup>71</sup> Berthelot and Matignon,<sup>8</sup> Thomsen,<sup>15</sup> and Rossini.<sup>13</sup> The last named investigator found for the reaction,  $C_2H_6$  (g) +  $3\frac{1}{2}O_2$  (g) =  $2CO_2$  (g) +  $3H_2O$  (liq.),  $Q = 372.81 \pm 0.11$ , at  $25^\circ$  and a constant pressure of 1 atmosphere. This value is equivalent to  $373.05 \pm 0.11$  at  $18^\circ$ , whence, for  $C_2H_6$  (g),  $Q_f = 20.96 \pm 0.15$ .

$C_2H_6$  (liq.). Wiebe, Hubbard, and Brevoort<sup>1</sup> measured the heat of vaporization of ethane. Vapor pressure data were reported by Porter,<sup>1</sup> Dana, Jenkins, Burdick, and Timms,<sup>1</sup> Loomis and Waters,<sup>1</sup> Prins,<sup>1</sup> Burrell and Robertson,<sup>2</sup> Maass and McIntosh,<sup>1</sup> Cardoso and Bell,<sup>11</sup> Cardoso,<sup>1</sup> Kuenen and Robson,<sup>1</sup> Kuenen,<sup>1</sup> Olszewski,<sup>2, 11</sup> Hara and Shinozaki,<sup>1</sup> Ladenburg and Krugel,<sup>2</sup> and Dewar.<sup>2</sup>

$C_2H_6$  (c). Wiebe, Hubbard, and Brevoort<sup>1</sup> measured the heat of fusion of ethane.

$CHO_2^-$  (aq.). The value for aqueous formate ion is obtained from those for aqueous sodium and potassium formates.

$HCO_3^-$  (aq.). The values for aqueous bicarbonate ion, obtained from aqueous  $LiHCO_3$ ,  $NaHCO_3$ ,  $KHCO_3$ , and  $RbHCO_3$ , are 164.8, 164.9, 164.7, and 164.9, respectively. The equilibrium data of Kendall<sup>1</sup> and of Klemenc and Herzog<sup>1</sup> yield  $Q = 2.89$  and  $2.78$ , respectively, for the reaction,  $H_2CO_3$  (aq.) =  $H^+$  (aq.) +  $HCO_3^-$  (aq.); whence, for  $HCO_3^-$  (aq.),  $Q_f = 164.7$  and  $164.8$ , respectively.

**HCHO (g).** The data of von Wartenberg, Muchlinski, and Riedler<sup>1</sup> (see Kharasch<sup>1</sup>) yield 134.1 for the heat of combustion of gaseous formaldehyde.

**CH<sub>3</sub>OH (g).** The heat of combustion of gaseous methyl alcohol was measured by Thomsen<sup>15</sup> and Rossini,<sup>9, 10</sup> and of liquid methyl alcohol by Favre and Silbermann,<sup>1</sup> Stohmann, Kleber, and Langbein,<sup>4</sup> Richards and Davis,<sup>1</sup> Roth and Müller,<sup>3</sup> Roth and Banse,<sup>1</sup> and I. G. Farbenfabrik.<sup>1</sup> These data were reviewed by Rossini.<sup>10</sup> For the heat for the reaction,  $\text{CH}_3\text{OH (g)} + \frac{3}{2} \text{O}_2 \text{(g)} = \text{CO}_2 \text{(g)} + 2\text{H}_2\text{O (liq.)}$ , at 25° and a constant total pressure of 1 atmosphere (the methyl alcohol being at a pressure slightly below saturation), Rossini<sup>16</sup> gave the value  $182.58 \pm 0.05$ . At 18°, this value becomes  $182.75 \pm 0.05$ .

**CH<sub>3</sub>OH (liq.).** Rossini<sup>16</sup> reviewed the published data on the heat of vaporization of methyl alcohol and concluded that the best data are those of Fiock, Ginnings, and Holton.<sup>1</sup> Earlier calorimetric determinations on the heat of vaporization of methyl alcohol were reported by Brown,<sup>1, 2</sup> Marshall,<sup>1</sup> Mathews,<sup>2</sup> Mills,<sup>1</sup> Tyrer,<sup>1, 2</sup> Wirtz,<sup>1</sup> Young,<sup>2</sup> Jahn,<sup>4</sup> and Schall.<sup>1</sup> Vapor pressure data on methyl alcohol were reported by Timmermans,<sup>1</sup> Young,<sup>2</sup> Richards and Shipley,<sup>1</sup> Mundel,<sup>1</sup> Richardson,<sup>1</sup> Tyrer,<sup>4</sup> Drucker, Jimmens, and Kangro,<sup>1</sup> Atkins and Wallace,<sup>1</sup> Young and Fortey,<sup>1</sup> and Regnault.<sup>6</sup>

**CH<sub>3</sub>OH (c).** Data on the heat of fusion of methyl alcohol were reported by the following: Kelley,<sup>1</sup>  $-0.76$  at  $-98^\circ$ ; Maass and Waldbauer,<sup>1</sup>  $-0.53$  at  $-97^\circ$ ; Parks,<sup>1</sup>  $-0.71$  at  $-98^\circ$ . See also Mitzukuri.<sup>1</sup> Parks<sup>1</sup> measured the heat of transition at  $-112^\circ$ .

**CH<sub>3</sub>OH (aq.).** Data on the heat of solution of methyl alcohol in water were reported by Berthelot,<sup>36</sup> deForcrand,<sup>6, 7</sup> and Bose.<sup>1a</sup> The latter's data also yield values for the heat of dilution of aqueous methyl alcohol.

**CH<sub>3</sub>O<sup>-</sup> (CH<sub>3</sub>OH).** Wolfenden, Jackson, and Hartley<sup>1</sup> reported the heat of ionization of liquid methyl alcohol, in liquid methyl alcohol, to be  $-11.2$ .

**HCOOH (liq.).** The heat of combustion of gaseous formic acid was measured by Favre and Silbermann<sup>1</sup> and Thomsen,<sup>15</sup> and of liquid formic acid by Berthelot and Matignon,<sup>5, 10</sup> and Jahn.<sup>2</sup> The data yield the following values for the heat of combustion of liquid formic acid: Thomsen,<sup>15</sup> 63.0; Berthelot and Matignon,<sup>5, 10</sup> 62.5; Jahn,<sup>2</sup> 63.0. Berthelot,<sup>25, 150</sup> measured the heat of decomposition of formic acid with aqueous sulfuric acid.

**HCOOH (g), (HCOOH)<sub>2</sub> (g).** Ramsperger and Porter<sup>2</sup> and Coodlidge<sup>1</sup> studied the equilibrium,  $(\text{HCOOH})_2 \text{(g)} = 2\text{HCOOH (g)}$ , and their data yield  $-14.13$  for the heat of this reaction. The equilibrium concentrations in mole fraction are, for  $(\text{HCOOH})_2 \text{(g)}$  and  $\text{HCOOH (g)}$ , respectively, about 0.80 and 0.20 at 18°, and about 0.52 and 0.48 at the boiling point, 100.8°. Data on the heat of vaporization of liquid formic acid to form the equilibrium mixture of  $(\text{HCOOH})_2 \text{(g)}$  and  $\text{HCOOH (g)}$

were reported by Ramsperger and Porter,<sup>1, 2</sup> Marshall,<sup>1</sup> Ogier,<sup>3</sup> and Favre and Silbermann.<sup>10</sup> We have calculated  $Q = -8.57$  for the reaction  $2\text{HCOOH (liq.)} = (\text{HCOOH})_2 \text{ (g), at } 18^\circ$ .

**HCOOH (c).** The data on the heat of fusion of formic acid at its melting point are: Coolidge,<sup>1</sup>  $-3.05$ ; Zanninovich-Tessarini,<sup>1</sup>  $-2.63$ ; Tammann,<sup>3</sup>  $-2.82$ ; Petersen,<sup>3, 4</sup>  $-2.68$ ; Berthelot,<sup>25</sup>  $-2.40$ ; Rideal,<sup>1</sup>  $-2.62$ .

**HCOOH (aq.).** Data on the heat of solution and of dilution of formic acid in water were reported by Berthelot,<sup>25</sup> Faucon,<sup>1</sup> and Thomsen.<sup>15</sup> Thomsen<sup>15</sup> measured the heat of oxidation of aqueous formic acid with aqueous potassium permanganate, and his data yield, for HCOOH (aq.),  $Q_f = 101.4$ . See also Wrewskii and Stagleova,<sup>1</sup> who reported values for the heat of polymerization of formic acid in water (and also in benzene).

**H<sub>2</sub>CO<sub>3</sub> (aq.).** This is taken as equivalent to  $\text{CO}_2 \text{ (aq.)} + \text{H}_2\text{O (liq.)}$ .

**HC<sub>2</sub>O<sub>4</sub><sup>-</sup> (aq.).** The value for aqueous bioxalate ion is obtained from  $\text{NaHC}_2\text{O}_4 \text{ (aq.)}$ .

**(COOH)<sub>2</sub> (c).** The heat of combustion of crystalline oxalic acid was measured by Stohmann, Kleber, and Langbein,<sup>1</sup> Jahn,<sup>2</sup> and Verkade, Hartman, and Coops.<sup>2</sup> The data of the last named investigation were reviewed by Washburn,<sup>2</sup> who showed that the correction to a pressure of 1 atmosphere (from the conditions of the bomb process) is  $-0.66$  per cent. With the Washburn correction to 1 atmosphere, the data of Verkade, Hartman, and Coops<sup>2</sup> yield  $59.7$  for the heat of the reaction,  $(\text{COOH})_2 \text{ (c)} + \frac{1}{2} \text{O}_2 \text{ (g)} = 2\text{CO}_2 \text{ (g)} + \text{H}_2\text{O (liq.)}$  at  $18^\circ$  and a constant pressure of 1 atmosphere.

**(COOH)<sub>2</sub> (g).** Vapor pressure data on crystalline oxalic acid were reported by Noyes and Webbe.<sup>1</sup>

**(COOH)<sub>2</sub> (aq.).** Thomsen<sup>15</sup> and Berthelot<sup>10, 25</sup> measured the heat of solution of oxalic acid. With Thomsen's value  $S = -2.26_{200}$ , we have computed, for  $(\text{COOH})_2 \text{ (aq.)}$ ,  $Q_f = 195.3$ . Thomsen's<sup>15</sup> data on the reaction of aqueous hypochlorous acid with aqueous oxalic acid yield, for  $(\text{COOH})_2 \text{ (aq.)}$ ,  $Q_f = 194.5$ . Berthelot's<sup>25</sup> data on the reaction of gaseous chlorine with aqueous oxalic acid yield, for  $(\text{COOH})_2 \text{ (aq.)}$ ,  $Q_f = 194.8$ . Berthelot's<sup>25</sup> data on the reaction of aqueous potassium permanganate with aqueous oxalic acid yield, for  $(\text{COOH})_2 \text{ (aq.)}$ ,  $Q_f = 195.5$ .

**(COOH)<sub>2</sub> · 2H<sub>2</sub>O (c).** The heat of solution of oxalic acid dihydrate was measured by Thomsen,<sup>15</sup> Favre and Silbermann,<sup>3</sup> Berthelot,<sup>10</sup> Graham,<sup>3</sup> Jorissen,<sup>2</sup> Jorissen and van der Stadt,<sup>1</sup> and Roth and Eymann.<sup>1</sup> Jorissen and van der Stadt<sup>1</sup> measured the heat of combustion. Timofejew<sup>1</sup> measured the heat of solution in methyl and ethyl alcohols.

**C<sub>2</sub>H<sub>3</sub>O<sub>2</sub><sup>-</sup> (∞).** The value for aqueous acetate ion at infinite dilution is obtained from that for aqueous sodium acetate at infinite dilution.

**C<sub>2</sub>H<sub>3</sub>O<sub>3</sub><sup>-</sup> (aq.).** The value for aqueous glycollate ion is obtained from those for the aqueous salts.

(CHO)<sub>2</sub> (c). Estimating the Washburn<sup>2</sup> correction to be  $-0.15$  per cent, we have computed from the data of deForcrand<sup>3</sup> (see Kharasch<sup>1</sup>) the heat of combustion of glyoxal to be 172.0.

(CHO)<sub>2</sub> (aq.). deForcrand<sup>3</sup> measured the heat of solution of glyoxal.

(CHO)<sub>2</sub> (g). We have estimated the heat of sublimation of glyoxal.

(HO)<sub>2</sub>CHCOOH (c). Berthelot and Matignon<sup>6</sup> (see Kharasch<sup>1</sup>) measured the heat of combustion of glyoxylic acid. Estimating the Washburn<sup>2</sup> correction to be  $-0.25$  per cent, we have calculated the heat of combustion to be 125.2.

(HO)<sub>2</sub>CHCOOH (aq.). deForcrand<sup>17</sup> measured the heat of solution of glyoxylic acid.

CH<sub>3</sub>CHO (g). The heat of combustion of gaseous acetaldehyde was measured by Thomsen<sup>15</sup> and Berthelot and Ogier,<sup>2</sup> and of liquid acetaldehyde by Berthelot and Delepine<sup>4</sup> and Louguinine.<sup>25</sup> Thomsen's<sup>15</sup> data yield 281.6 for the heat of combustion of the gas.

CH<sub>3</sub>CHO (liq.). Berthelot<sup>33</sup> measured the heat of vaporization of acetaldehyde to be  $-6.02$  at 22°. The vapor pressure data of Gilmour<sup>1</sup> yield  $-6.6$  at 22°.

CH<sub>3</sub>CHO (c). Cooper<sup>1</sup> measured the heat of fusion of acetaldehyde.

C<sub>2</sub>H<sub>4</sub>O (g). Thomsen's<sup>15</sup> data yield 312.3 for the heat of combustion of ethylene oxide in the gaseous state; those of Berthelot<sup>31</sup> yield the value 308.4.

C<sub>2</sub>H<sub>4</sub>O (liq.). Berthelot<sup>31</sup> reported a value for the heat of vaporization of ethylene oxide. Vapor pressure data were reported by Everheim.<sup>1</sup>

CH<sub>3</sub>COOH (liq.). The heat of combustion of liquid acetic acid was measured by Berthelot and Matignon<sup>3</sup> and Roth,<sup>2</sup> and of gaseous acetic acid by Thomsen.<sup>15</sup> Applying a Washburn correction of  $-0.10$  per cent, we have computed Roth's<sup>2</sup> value to be 206.7 for the heat of combustion of the liquid, and that of Berthelot and Matignon<sup>3</sup> to be 209.2. Thomsen's<sup>15</sup> data yield 227.4 for the heat of reaction of gaseous acetic acid at 111° with oxygen at 18° to form gaseous carbon dioxide and liquid water at 18°.

CH<sub>3</sub>COOH (c). Louguinine and Dupont,<sup>1</sup> Parks and Kelley,<sup>1</sup> Berthelot,<sup>3</sup> Petterson,<sup>1, 4</sup> Bridgman,<sup>7</sup> Raoult,<sup>1</sup> Garner, Madden, and Rushbroke,<sup>1</sup> and Pickering<sup>10</sup> determined the heat of fusion of acetic acid.

CH<sub>3</sub>COOH (aq.). The heat of solution of solid acetic acid in water was measured by Berthelot,<sup>3, 9</sup> and Petterson,<sup>1</sup> and of liquid acetic acid in water by Berthelot,<sup>3, 9</sup> and Berthelot and Louguinine.<sup>1</sup> Data on the heat of dilution of aqueous acetic acid were reported by Thomsen,<sup>15</sup> Berthelot and Louguinine,<sup>1</sup> Berthelot,<sup>3, 9</sup> Faucon,<sup>1</sup> Payn and Perman,<sup>1</sup> Bose,<sup>1</sup> and Richards and Gucker.<sup>1</sup> We have extrapolated the data of Richards and Gucker<sup>1</sup> to infinite dilution to obtain a value for aqueous undissociated CH<sub>3</sub>COOH at infinite dilution in water.

HCOOCH<sub>3</sub> (g). Thomsen<sup>15</sup> and Berthelot and Ogier<sup>3</sup> measured the heat of combustion of gaseous methyl formate, and Berthelot and Dele-

pine<sup>4</sup> that of liquid methyl formate. Their data yield for the heat of combustion of the gas, 241.0, 240.2, and 240.9, respectively.

**HCOOCH<sub>3</sub> (liq.).** The heat of vaporization of methyl formate was measured by Mathews<sup>2</sup> and Berthelot and Ogier,<sup>3</sup> who reported the values 6.75 and 6.9, respectively, at 31°. Vapor pressure data were reported by Olszewski<sup>2</sup> and Pierre.<sup>1</sup>

**HCOOCH<sub>3</sub> (c).** Rideal<sup>1</sup> computed the heat of fusion of methyl formate.

**C<sub>2</sub>H<sub>5</sub>OH (g).** The heat of combustion of ethyl alcohol was measured by Andrews,<sup>5, 14</sup> Favre and Silbermann,<sup>1</sup> Berthelot and Matignon,<sup>5</sup> Atwater and Rosa,<sup>1</sup> Atwater and Snell,<sup>1</sup> Emory and Benedict,<sup>1</sup> Roth and Müller,<sup>3</sup> Richards and Davis,<sup>1</sup> and Rossini.<sup>10</sup> These data were reviewed by Rossini<sup>10</sup> whose own experiments on the heat of combustion of gaseous ethyl alcohol at 32.50° yield (see Rossini<sup>16</sup>) for the heat of the reaction, C<sub>2</sub>H<sub>5</sub>OH (g) + 3 O<sub>2</sub> (g) = 2CO<sub>2</sub> (g) + 3H<sub>2</sub>O (liq.),  $Q = 336.78 \pm 0.10$  at 25° and a constant total pressure of 1 atmosphere. This value becomes  $337.06 \pm 0.10$  at 18°.

**C<sub>2</sub>H<sub>5</sub>OH (liq.).** The heat of vaporization of ethyl alcohol was measured by Brown,<sup>1, 2</sup> Marshall and Ramsay,<sup>1</sup> Louguinine,<sup>11</sup> Mathews,<sup>2</sup> Mills,<sup>1</sup> Tyrer,<sup>1</sup> Wirtz,<sup>1</sup> Young,<sup>2</sup> Jahn,<sup>4</sup> Regnault,<sup>6, 9</sup> Schall,<sup>1</sup> Andrews,<sup>6</sup> Parks and Nelson,<sup>1</sup> Svensson,<sup>1</sup> and Fiock, Ginnings and Holton.<sup>1</sup> See Rossini.<sup>16</sup>

**C<sub>2</sub>H<sub>5</sub>OH (c).** The heat of fusion of ethyl alcohol was measured by Gibson, Parks, and Latimer<sup>1</sup> and Parks.<sup>1</sup> See also Mitsukuri<sup>1</sup> and Mitsukuri and Hara.<sup>2</sup>

**C<sub>2</sub>H<sub>5</sub>OH (aq.).** The heat of mixing alcohol with water was measured by Berthelot,<sup>36</sup> Bose,<sup>1</sup> Dupre and Page,<sup>1</sup> MacInnis and Braham,<sup>1</sup> Pratt,<sup>1</sup> de Forcrand,<sup>22</sup> Winkelmann,<sup>4</sup> and Kolosovskii.<sup>1</sup>

**C<sub>2</sub>H<sub>5</sub>O<sup>-</sup> (aq.).** van Deventer and Cohen<sup>1</sup> measured the heat of neutralization of NaOC<sub>2</sub>H<sub>5</sub> in ethyl alcohol with HCl in ethyl alcohol.

**CH<sub>2</sub>OHCOOH (c).** Stohmann, Kleber, Langbein, and Offenhauer,<sup>1, 2</sup> (see Kharasch<sup>1</sup>) measured the heat of combustion of solid glycollic acid.

**CH<sub>2</sub>OHCOOH (aq.).** de Forcrand<sup>3</sup> measured the heat of solution of solid glycollic acid in water.

**(CH<sub>3</sub>)<sub>2</sub>O (g).** The heat of combustion of gaseous dimethyl ether was measured by Thomsen<sup>15</sup> and Berthelot.<sup>71</sup> See also Berner.<sup>4</sup> Thomsen's<sup>15</sup> data yield 349.0 for the heat of combustion of the gas.

**(CH<sub>3</sub>)<sub>2</sub>O (liq.).** Vapor pressure data were reported by Cardoso and Bruni<sup>1</sup> and Regnault.<sup>7</sup>

**(CH<sub>2</sub>OH)<sub>2</sub> (liq.).** Stohman and Langbein<sup>3</sup> and Louguinine<sup>2</sup> measured the heat of combustion of ethylene glycol (see Kharasch<sup>1</sup>).

**(CH<sub>2</sub>OH)<sub>2</sub> (g).** Vapor pressure data on ethylene glycol were reported by de Forcrand.<sup>33</sup> Louguinine<sup>2</sup> measured the heat of condensation. These data yield  $V = -14.3$  and  $-11.8$ , respectively.

**CF<sub>4</sub> (g).** von Wartenberg and Schütte<sup>1</sup> measured the heat of the reaction, C (charcoal) + 2 F<sub>2</sub> (g) = CF<sub>4</sub> (g), to be  $165.0 \pm 2.0$ .

**CH<sub>2</sub>FCH<sub>2</sub>OH (liq.).** Swarts<sup>4, 5</sup> (see Kharasch<sup>1</sup>) measured the heat of combustion of monofluoroethanol.

**CHF<sub>2</sub>CH<sub>2</sub>OH (liq.).** Swarts<sup>4, 5</sup> (see Kharasch<sup>1</sup>) measured the heat of combustion of difluoroethanol.

**CH<sub>2</sub>FCOOH (c).** Swarts<sup>4</sup> (see Kharasch<sup>1</sup>) measured the heat of combustion of monofluoroacetic acid.

**CHF<sub>2</sub>COOH (liq.).** Swarts<sup>4</sup> (see Kharasch<sup>1</sup>) measured the heat of combustion of difluoroacetic acid.

**CCl<sub>4</sub> (g).** Bodenstein, Gunther, and Hoffmeister<sup>1</sup> measured the heat of the reaction, CCl<sub>4</sub> (g) + 2 H<sub>2</sub> (g) = C ("acetylene" carbon) + 4 HCl (g), to be 62.0; whence, for CCl<sub>4</sub> (g),  $Q_f = 25.9$ . Berthelot<sup>108</sup> and Thomsen<sup>15</sup> measured the heat of combustion of carbon tetrachloride.

**CCl<sub>4</sub> (liq.).** Data on the heat of vaporization of carbon tetrachloride were reported by Marshall,<sup>1</sup> Mathews,<sup>2</sup> Mills,<sup>1</sup> Tyrer,<sup>3</sup> and Regnault.<sup>8, 9</sup> Vapor pressure data were reported by Young,<sup>2</sup> Burrell and Robertson,<sup>2</sup> Cardoso and Braume,<sup>2</sup> Guye and Drouguinine,<sup>1</sup> Keyes, Taylor, and Smith,<sup>1</sup> Olszewski,<sup>2, 4</sup> and Pierre.<sup>1</sup>

**CCl<sub>4</sub> (c).** The data on the heat of fusion of CCl<sub>4</sub> (c, I) are: Latimer,<sup>1</sup> -0.69 at -24°; Bridgman,<sup>2</sup> -0.55 at -23°. Latimer<sup>1</sup> measured the heat of transition.

**C<sub>2</sub>Cl<sub>6</sub> (c).** Berthelot<sup>108</sup> measured the heat of combustion of solid hexachloroethane, but his value of 110.0 (see Kharasch<sup>1</sup>) is much too low. The vapor pressure data of Nelson<sup>1</sup> yield -17.0 for the heat of sublimation.

**C<sub>2</sub>Cl<sub>6</sub> (g).** We have estimated this value.

**C<sub>2</sub>Cl<sub>4</sub> (g).** Thomsen<sup>15</sup> measured the heat of combustion of gaseous tetrachloroethylene, and his data yield  $Q_f = -6.0$ .

**C<sub>2</sub>Cl<sub>4</sub> (liq.).** Berthelot<sup>108</sup> reported a value for the heat of combustion of liquid tetrachloroethylene, but his value must be too low. Mathews<sup>2</sup> reported the heat of vaporization to be -8.27 at 120°; the vapor pressure data of Herz and Rathmann<sup>1</sup> yield -8.4.

**COCl<sub>2</sub> (g).** Thomsen's<sup>15</sup> data on the heat of combustion of gaseous phosgene yield  $Q_f = 52.7$ . Thomsen<sup>15</sup> and Berthelot<sup>51</sup> measured the heat of reaction of gaseous phosgene with aqueous potassium hydroxide, and their data yield, for COCl<sub>2</sub> (g),  $Q_f = 54.4$  and 60.6, respectively. The equilibrium data of Bodenstein and Plant,<sup>1</sup> Bodenstein and Danant,<sup>1</sup> Atkinson, Heycock, and Pope,<sup>1</sup> Christiansen,<sup>1</sup> and Weigert<sup>1</sup> on the reaction, CO (g) + Cl<sub>2</sub> (g) = COCl<sub>2</sub> (g), yield, for COCl<sub>2</sub> (g),  $Q_f = 53.5$ .

**COCl<sub>2</sub> (liq.).** Vapor pressure data were reported by Atkinson, Heycock, and Pope,<sup>1</sup> Nikiten,<sup>2</sup> Paterno and Mazzuchelli,<sup>1</sup> Perry and Porter,<sup>1</sup> and Germann and Taylor.<sup>1</sup>

**CH<sub>3</sub>Cl (g).** Thomsen<sup>15</sup> and Berthelot<sup>70</sup> measured the heat of combustion of methyl chloride. Thomsen's<sup>15</sup> data yield  $Q_f = 20.1$ .

**CH<sub>3</sub>Cl (liq.).** The heat of vaporization was measured by Chappuis,<sup>3</sup> Shorthose,<sup>1</sup> Yates,<sup>1</sup> and Regnault.<sup>9</sup> Vapor pressure data were reported by Holts,<sup>2</sup> Shorthose,<sup>1</sup> and Regnault.<sup>6, 7</sup>

$\text{C}_2\text{H}_2\text{Cl}_2$  (liq.). Berthelot and Ogier<sup>1</sup> measured the heat of combustion.

$\text{C}_2\text{H}_2\text{Cl}_2$  (g). Mathews<sup>2</sup> found the heat of vaporization to be  $-6.69$  at  $40^\circ$ . Vapor pressure data were reported by Korber,<sup>1</sup> Nilson and Peterson,<sup>1</sup> and Perry.<sup>1</sup>

$\text{CHCl}_3$  (g). The heat of combustion of chloroform was measured by Thomsen,<sup>15</sup> Berthelot,<sup>108</sup> and Berthelot and Matignon.<sup>5a</sup> Thomsen's<sup>15</sup> data yield, for  $\text{CHCl}_3$  (g),  $Q_f = 21.7$ . We have estimated 23.6.

$\text{CHCl}_3$  (liq.). Data on the heat of vaporization of chloroform were reported by Regnault,<sup>8,9</sup> Marshall,<sup>1</sup> Mathews,<sup>2</sup> Mills,<sup>1</sup> Tyrer,<sup>3</sup> and Wirtz.<sup>1</sup>

$\text{CHCl}_3$  (c). Mitsukuri and Aoki<sup>1</sup> reported a value for the heat of fusion.

$\text{CHCl}_3$  (aq.). Berthelot<sup>43</sup> measured the heat of solution of chloroform in water.

$\text{C}_2\text{H}_3\text{Cl}$  (g). Thomsen's<sup>15</sup> data on the heat of combustion yield, for monochlorethylene, or vinyl chloride,  $Q_f = -6.5$ . We have estimated  $Q_f = -9$ .

$\text{C}_2\text{H}_3\text{Cl}$  (liq.). Vapor pressure data were reported by Dana, Burdick, and Jenkins.<sup>1</sup>

$\text{C}_2\text{H}_5\text{Cl}$  (g). Thomsen<sup>15</sup> and Berthelot<sup>108</sup> measured the heat of combustion of ethyl chloride. The data of the former yield  $Q_f = 25.7$ .

$\text{C}_2\text{H}_5\text{Cl}$  (liq.). Yates<sup>1</sup> and Regnault<sup>6</sup> measured the heat of vaporization. Vapor pressure data were reported by Berthoud,<sup>1</sup> Jenkins and Shorthose,<sup>1</sup> Regnault,<sup>6</sup> and Antoine.<sup>3</sup>

$\text{CH}_2\text{ClCH}_2\text{Cl}$  (g). Thomsen<sup>15</sup> measured the heat of combustion of ethylene chloride.

$\text{CH}_2\text{ClCH}_2\text{Cl}$  (liq.). The heat of vaporization of ethylene chloride was measured by Jahn<sup>4</sup> and Mathews.<sup>2</sup> Vapor pressure data were reported by Pearce and Peters,<sup>1</sup> Rex,<sup>1</sup> Stadel,<sup>1</sup> and Timmermans.<sup>1</sup>

$\text{CH}_3\text{CHCl}_2$  (g). Data on the heat of combustion of ethylidene chloride were reported by Thomsen<sup>15</sup> and Berthelot and Ogier.<sup>3</sup>

$\text{CH}_3\text{CHCl}_2$  (liq.). Vapor pressure data were reported by Reilly and Hickinbottom<sup>1</sup> and Stadel.<sup>1</sup>

$\text{CHCl}_2\text{CHCl}_2$  (g). We have estimated the heat of formation of symmetrical tetrachloroethane.

$\text{CHCl}_2\text{CHCl}_2$  (liq.). Vapor pressure data were obtained by Nelson.<sup>1</sup>

$\text{CHCl}_2\text{CCl}_3$  (g). We have estimated the value for pentachloroethane.

$\text{CHCl}_2\text{CCl}_3$  (liq.). Vapor pressure data were obtained by Nelson.<sup>1</sup>

$\text{CH}_2\text{ClCHO}$  (liq.). Rivals<sup>1,2</sup> measured the heat of combustion of monochloroacetaldehyde.

$\text{CH}_3\text{COCl}$  (liq.). Berthelot and Louguinine<sup>1</sup> measured the heat of reaction of liquid acetyl chloride with water to be 23.3. See also Rivals.<sup>1,5</sup>

$\text{CH}_3\text{COCl}$  (g). Berthelot and Ogier<sup>8</sup> measured the heat of vaporization of acetyl chloride.

$\text{CH}_2\text{ClCOCl}$  (liq.). Rivals<sup>1, 2</sup> measured the heat of reaction of liquid monochloroacetyl chloride with aqueous potassium hydroxide.

$\text{Cl}_3\text{CCHO}$  (aq.). Berthelot<sup>43, 60</sup> measured the heat of the reaction,  $\text{Cl}_3\text{CCHO}$  (aq.) +  $\text{KOH}$  (aq.) = ( $\text{KCHO}_2 + \text{CHCl}_3$ ) (aq.), to be 13.15; whence, for aqueous chloral,  $Q_f = 65.4$ .

$\text{Cl}_3\text{CCHO}$  (liq.). Berthelot<sup>43, 60</sup> measured the heat of solution of liquid chloral in water.

$\text{Cl}_3\text{CCHO}$  (g.). Berthelot<sup>43, 60</sup> determined the heat of vaporization of liquid chloral.

$\text{Cl}_3\text{CCH}(\text{OH})_2$  (g.). Berthelot<sup>43, 60</sup> measured the heat of solution of gaseous chloral hydrate.

$\text{Cl}_3\text{CCH}(\text{OH})_2$  (c, II). Berthelot<sup>43, 60</sup> measured the heat of solution of this solid form of chloral hydrate.

$\text{Cl}_3\text{CCH}(\text{OH})_2$  (liq.). Berthelot reported the heat of fusion of chloral hydrate (c, II).

$\text{Cl}_3\text{CCH}(\text{OH})_2$  (c, I). Berthelot<sup>43, 60</sup> measured the heat of fusion.

$\text{CH}_2\text{ClCOOH}$  (c,  $\alpha$ ). Berthelot and Matignon<sup>7</sup> measured the heat of combustion of monochloroacetic acid (c,  $\alpha$ ).

$\text{CH}_2\text{ClCOOH}$  (liq.). The data on the heat of fusion of monochloroacetic acid (c,  $\alpha$ ) at 61° are: Pickering,<sup>10</sup> -3.90; Steiner and Johnston,<sup>1</sup> -4.63. See also Tanatar<sup>4</sup> and Louguinine.<sup>1</sup>

$\text{CH}_2\text{ClCOOH}$  (c,  $\beta$ ). The data on the heat of fusion of monochloroacetic acid (c,  $\beta$ ) at 56° are: Pickering,<sup>10</sup> -3.33; Steiner and Johnston,<sup>1</sup> -4.45. See also Tanatar<sup>4</sup> and Louguinine.<sup>1</sup>

$\text{CH}_2\text{ClCOOH}$  (c,  $\gamma$ ). Steiner and Johnston<sup>1</sup> measured the heat of fusion of monochloroacetic acid (c,  $\gamma$ ). See also Tanatar<sup>4</sup> and Louguinine.<sup>1</sup>

$\text{CH}_2\text{ClCOOH}$  (aq.). For the heat of solution of monochloroacetic acid (c,  $\alpha$ ) in water, Pickering<sup>10</sup> found -3.35 and Louguinine -2.33.

$\text{CH}_2\text{ClCOOH}$  (g.). Vapor pressure data were reported by Patterson.<sup>1</sup>

$\text{CH}_2\text{ClCOO}^-$  (aq.). The value for aqueous monochloroacetate ion is obtained from that for the aqueous sodium salt.

$\text{CCl}_3\text{COOH}$  (c). Berthelot and Matignon<sup>7</sup> measured the heat of combustion of trichloroacetic acid.

$\text{CCl}_3\text{COOH}$  (liq.). Pickering<sup>10</sup> measured the heat of fusion.

$\text{CCl}_3\text{COOH}$  (aq.). Pickering<sup>10</sup> and Louguinine<sup>1</sup> found the heat of solution of solid trichloroacetic acid in water to be 2.70<sub>400</sub><sup>15</sup> and 2.89<sub>100</sub>, respectively.

$\text{CHCl}_2\text{COOH}$  (aq.). We have estimated the value for the heat of formation of aqueous dichloroacetic acid.

$\text{CHCl}_2\text{COOH}$  (liq.). Louguinine<sup>1</sup> and Pickering<sup>10</sup> measured the heat of solution of liquid dichloroacetic acid.

$\text{CHCl}_2\text{COOH}$  (c). Pickering<sup>10</sup> measured the heat of fusion of dichloroacetic acid.

$\text{CHCl}_2\text{COOH}$  (g.). Louguinine<sup>1</sup> measured the heat of vaporization.

$\text{CH}_2\text{ClCH}_2\text{OH}$  (liq.). Berthelot<sup>62</sup> reported  $Q = 36.0$  for the reaction

of gaseous ethylene oxide with gaseous hydrogen chloride to form liquid monochloroethanol.

**COBr<sub>2</sub> (g).** Trautz<sup>8</sup> studied the equilibrium,  $\text{CO (g)} + \text{Br}_2 \text{ (g)} = \text{COBr}_2 \text{ (g)}$ , and computed  $Q = 3.14$ ; whence, for  $\text{COBr}_2 \text{ (g)}$ ,  $Q_f = 22.3$ .

**CH<sub>3</sub>Br (g).** Thomsen<sup>15</sup> and Berthelot<sup>70, 116</sup> measured the heat of combustion. Thomsen's<sup>15</sup> data yield  $Q_f = 8.5$ .

**C<sub>2</sub>H<sub>5</sub>Br (g).** Thomsen<sup>15</sup> measured the heat of combustion of gaseous ethyl bromide.

**C<sub>2</sub>H<sub>5</sub>Br (liq.).** The heat of vaporization was measured by Tyrer,<sup>2</sup> Marshall,<sup>1</sup> and Berthelot.<sup>53, 87</sup> Vapor pressure data were reported by Regnault,<sup>6, 7</sup> Rex,<sup>1</sup> Richards and Mathews,<sup>1</sup> Timmermans,<sup>1</sup> and Tyrer.<sup>1</sup>

**CH<sub>2</sub>BrCH<sub>2</sub>Br (liq.).** Berthelot<sup>34</sup> found  $Q = 29.3$  for the reaction,  $\text{C}_2\text{H}_4 \text{ (g)} + \text{Br}_2 \text{ (liq.)} = \text{CH}_2\text{BrCH}_2\text{Br (liq.)}$ ; whence, for liquid symmetrical dibromoethane,  $Q_f = 19.7$ .

**CH<sub>2</sub>BrCH<sub>2</sub>Br (g).** Vapor pressure data were reported by Regnault<sup>6</sup> and Timmermans.<sup>2</sup> Berthelot<sup>53</sup> reported  $V = -8.2$ . Antoine<sup>3</sup> calculated  $V = -9.1$ .

**CH<sub>3</sub>OH · HBr (c).** McIntosh<sup>2</sup> reported values for the heat of fusion and the heat of dissociation, at  $-83^\circ$ .

**CHBr<sub>3</sub> (g).** We have estimated the value for gaseous bromoform.

**CH<sub>2</sub>Br<sub>2</sub> (g).** We have estimated the value for gaseous dibromomethane.

**CBr<sub>4</sub> (g).** We have estimated the value for gaseous carbon tetrabromide.

**CH<sub>3</sub>COBr (liq.).** Berthelot and Louguinine<sup>1</sup> measured the heat of reaction of liquid acetyl bromide with water.

**Br<sub>3</sub>CCH(OH)<sub>2</sub> (c, I).** Bruner<sup>2</sup> measured the heat of solution of bromal hydrate (c, I) (old crystallized material) in aqueous KOH.

**Br<sub>3</sub>CCH(OH)<sub>2</sub> (c, II).** Bruner<sup>2</sup> measured the heat of solution of bromal hydrate (c, II) (freshly crystallized material) in aqueous KOH.

**Br<sub>3</sub>CCH(OH)<sub>2</sub> (aq.).** Bruner<sup>2</sup> measured the heat of solution of bromal hydrate in water.

**CH<sub>2</sub>BrCOOH (c).** Pickering<sup>10</sup> measured the heat of solution of monobromoacetic acid.

**CHBr<sub>2</sub>COOH (c).** Pickering<sup>10</sup> measured the heat of solution of dibromoacetic acid.

**CBr<sub>3</sub>COOH (c).** Pickering<sup>10</sup> measured the heat of solution of tribromoacetic acid.

**C<sub>2</sub>I<sub>4</sub> (c).** Berthelot<sup>121</sup> measured the heat of combustion of tetraiodoethylene.

**CH<sub>3</sub>I (g).** Thomsen<sup>15</sup> and Berthelot<sup>121</sup> measured the heat of combustion of gaseous methyl iodide.

**CH<sub>3</sub>I (liq.).** Marshall<sup>1</sup> measured the heat of vaporization. Vapor pressure data were reported by Brown and Acree,<sup>1</sup> Rex,<sup>1</sup> and Robertson and Acree.<sup>1</sup>

**CH<sub>2</sub>I<sub>2</sub> (liq.).** Berthelot<sup>121</sup> measured the heat of combustion.

$\text{CH}_2\text{I}_2$  (g). We have estimated the value for diiodomethane.

$\text{CHI}_3$  (c). Berthelot<sup>121</sup> measured the heat of combustion.

$\text{CHI}_3$  (g). We have estimated the value for gaseous iodoform.

$\text{C}_2\text{H}_5\text{I}$  (g). Thomsen<sup>15</sup> measured the heat of combustion of ethyl iodide.

$\text{C}_2\text{H}_5\text{I}$  (liq.). Data on the heat of vaporization were reported by Mathews,<sup>2</sup> Marshall,<sup>1</sup> Regnault<sup>6</sup> and Andrews.<sup>10</sup> Vapor pressure data were reported by Regnault,<sup>7</sup> Rex,<sup>1</sup> Robertson and Acree,<sup>1</sup> Thorpe and Rodger,<sup>1</sup> and Tyrer.<sup>4</sup>

$\text{CH}_2\text{ICH}_2\text{I}$  (c). Berthelot<sup>121</sup> measured the heat of combustion of ethylene iodide.

$\text{CH}_2\text{ICH}_2\text{I}$  (g). We have estimated this value.

$\text{CH}_3\text{COI}$  (liq.). Berthelot and Louguinine<sup>1</sup> measured the heat of reaction of acetyl iodide with water.

$\text{CH}_2\text{ICH}_2\text{Br}$  (c). Berthelot<sup>74</sup> measured the heat of the reaction,  $\text{CH}_2\text{ICH}_2\text{I}$  (c) +  $\text{Br}_2$  (liq.) =  $\text{CH}_2\text{ICH}_2\text{Br}$  (c) +  $\text{IBr}$  (liq.), to be 13.9.

(CS)<sub>x</sub> (c). Dewar<sup>2</sup> measured the heat of combustion of solid polymerized carbon monosulfide.

CS (g). We have estimated this value

CS<sub>2</sub> (g). Thomsen<sup>15</sup> measured the heat of combustion of gaseous carbon disulfide, and Berthelot<sup>73, 108</sup> that of the liquid. For CS<sub>2</sub> (g), Thomsen's<sup>15</sup> data yield  $Q_f = -28.6$ , and those of Berthelot  $-17.0$  and  $-24.4$ , respectively. The equilibrium data of Koref<sup>2</sup> yield  $-16.7$ .

CS<sub>2</sub> (liq.). Data on the heat of vaporization were reported by Mathews,<sup>2</sup> Mills,<sup>1</sup> Wirtz,<sup>1</sup> Winkelmann,<sup>2, 3</sup> Koref,<sup>1</sup> Andrews,<sup>5</sup> and Person.<sup>7</sup> Vapor pressure data were reported by Battelli,<sup>1</sup> Henning and Stock,<sup>1</sup> Mund,<sup>1</sup> Regnault,<sup>6, 7</sup> von Siemens,<sup>1</sup> Rex,<sup>1</sup> Stock and Seelig,<sup>1</sup> Galitzine,<sup>1</sup> Hannay,<sup>1</sup> and Muller and Grotrian.<sup>1</sup>

CS<sub>2</sub> (c). Mitsukuri and Aoki<sup>1</sup> reported a value for the heat of fusion.

COS (g). Thomsen's<sup>15</sup> data on the heat of combustion of gaseous carbonylsulfide yield, for COS (g),  $Q_f = 34.5$ . This value is in accord with the estimate of Lewis and Lacey<sup>1</sup> and with the equilibrium data of Stock, Sieke, and Pohland.<sup>1</sup> Berthelot's<sup>51</sup> data on the heat of combustion are in disagreement with the foregoing data. From spectroscopic data, Lockte, Holtgreven, and Bawn<sup>1</sup> computed the energy of dissociation of COS (g) into CO (g) and S (g), and their data yield, for COS (g),  $Q_f = 35$ .

COS (liq.). Vapor pressure data were reported by Stock and Kuss.<sup>1</sup>

CH<sub>3</sub>SH (g). Thomsen<sup>15</sup> reported the heat of combustion of gaseous methyl mercaptan.

CH<sub>3</sub>SH (liq.). Vapor pressure data were reported by Berthoud and Brun.<sup>1</sup>

(CH<sub>3</sub>)<sub>2</sub>S (g). Thomsen<sup>15</sup> measured the heat of combustion of gaseous dimethyl sulfide.

(CH<sub>3</sub>)<sub>2</sub>S (liq.). Vapor pressure data were reported by Berthoud and Brun.<sup>1</sup>

**C<sub>2</sub>H<sub>5</sub>SH (g).** The heat of combustion data of Thomsen<sup>15</sup> and Berthelot<sup>124, 125</sup> yield, for gaseous ethyl mercaptan,  $Q_f = 9.7$  and  $19$ , respectively.

**C<sub>2</sub>H<sub>5</sub>SH (liq.).** Vapor pressure data were reported by Berthoud and Brun.<sup>1</sup>

**C<sub>2</sub>H<sub>5</sub>HSO<sub>4</sub> (aq.).** Berthelot<sup>36</sup> reported the heat of reaction of aqueous ethanol with aqueous sulfuric acid. His data yield, for aqueous ethyl-sulfuric acid,  $Q_f = 208.2$ , which value seems too low.

**C<sub>2</sub>N<sub>2</sub> (g).** For the heat of the reaction,  $C_2N_2(g) + 2 O_2(g) = 2 CO_2(g) + N_2(g)$ , the various data are: Thomsen,<sup>15</sup>  $259.4$ ; Berner,<sup>4</sup>  $262.1$ ; Berthelot,<sup>54</sup>  $264$ ; Dulong,<sup>2</sup>  $275$ ; von Wartenberg and Schutza,<sup>1</sup>  $261.3$ ; McMorris and Badger,<sup>1</sup>  $251.4$ .

**C<sub>2</sub>N<sub>2</sub> (liq.).** Vapor pressure data were reported by Faraday,<sup>3</sup> Terwen,<sup>1</sup> Perry and Bardwell,<sup>1</sup> Chappuis and Riviere,<sup>1</sup> Cardoso and Braume,<sup>1</sup> Dewar,<sup>2</sup> and Bunsen.<sup>2</sup>

**C<sub>2</sub>N<sub>2</sub> (aq.).** Cyanogen is slowly hydrolyzed in contact with water. The data of Berthelot<sup>129</sup> and Hammerl<sup>2</sup> on the heat of solution of gaseous cyanogen in water yield, when extrapolated to zero time,  $S = 8.8$  and  $6.8$ , respectively.

**NCN<sub>3</sub> (c).** Darzen<sup>1</sup> measured the heat of decomposition of carbon perazuride.

**HCN (g).** The data on the heat of combustion are: Thomsen,<sup>15</sup>  $158.5$ ; Berthelot,<sup>76</sup>  $159.3$ .

**HCN (liq.).** Berthelot's<sup>27</sup> data on the reaction,  $HCN(liq.) + 2 H_2O(liq.) + HCl(aq.) = (NH_4Cl + HCHO_2)(aq.)$ , yield, for HCN (liq.),  $Q_f = -16.2$ . Berthelot<sup>27</sup> measured the heat of vaporization of liquid HCN to be  $-5.7$  at the boiling point. The following values, computed from vapor pressure data, were reported for the heat of vaporization at  $25^\circ$ : Bredig and Teichmann,<sup>1</sup>  $-6.74$ ; Hara and Sinozaki,<sup>1</sup>  $-6.6$ ; Sinozaki, Hara, and Mitsukuri,<sup>1</sup>  $-6.67$ ; Perry and Porter,<sup>1</sup>  $-6.65$ ; Bussy and Brugnet,<sup>1</sup>  $-6.7$ .

**HCN (c).** The data on the heat of fusion at  $-14^\circ$  are: Sinozaki, Hara, and Mitsukuri,<sup>1</sup>  $-1.72$ ; Perry and Porter,<sup>1</sup>  $-1.73$ ; Piloty and Steinbock,<sup>1</sup>  $-1.68$ .

**HCN (aq.).** Data on the heat of solution of HCN (liq.) were reported by Berthelot<sup>27</sup> and Bussy and Brugnet.<sup>1</sup>

**CN<sup>-</sup> (aq.).** The values for aqueous lithium, sodium, and potassium cyanides yield, for CN<sup>-</sup> (aq.),  $Q_f = -35.0$ ,  $-34.9$ , and  $-34.8$ , respectively. von Steinwehr's<sup>1</sup> conductivity data yield  $Q = -11.0$  for the reaction,  $HCN(aq.) = H^+(aq.) + CN^-(aq.)$ ; whence, for CN<sup>-</sup> (aq.),  $Q_f = -34.9$ .

**CN (g).** The energy of dissociation into gaseous atoms was reported by Birge and Sponer.<sup>1</sup> The values for the energy states of gaseous CN are from Mulliken,<sup>8</sup> Jenkins,<sup>1</sup> Kratjer,<sup>1</sup> Ryde and Asundi,<sup>1</sup> Herzberg,<sup>2</sup> Heitler and Herzberg,<sup>1</sup> Turner and Samson,<sup>1</sup> and Weizel.<sup>1</sup>

**CN<sup>-</sup> (g).** Lederle<sup>2</sup> calculated the energy of the reaction,  $CN(g) + \theta = CN^-(g)$ , to be  $92$ , from spectroscopic data on cyanonitrite. From the

lattice energies of KCN and NaCN, Sherman<sup>1</sup> computed the values 110.5 and 112.5 for the electron affinity of CN (g).

**CNO<sup>-</sup> (aq.).** This value is obtained from those for the aqueous salts.

**CH<sub>3</sub>NH<sub>2</sub> (g).** For the heat of combustion of gaseous methylamine, Thomsen<sup>15</sup> found 258.1 and Muller<sup>4</sup> 261.4. See also Lemoult.<sup>2</sup>

**CH<sub>3</sub>NH<sub>2</sub> (liq.).** Gautier (see Berthelot<sup>151</sup>) measured the heat of vaporization to be -6.57. The vapor pressure data of Berthoud,<sup>1</sup> Felsing and Thomas,<sup>1</sup> and Plank and Vahl<sup>1</sup> yield -6.40 at -7°.

**CH<sub>3</sub>NH<sub>2</sub> (aq.).** Data on the heat of solution of gaseous methylamine in water were obtained by Bonnifoi<sup>3</sup> and Felsing and Wohlford.<sup>1</sup>

**CH<sub>3</sub>NH<sub>2</sub>·HCl (aq.).** Muller<sup>1, 6</sup> measured the heat of reaction of aqueous methylamine with aqueous HCl to be 13.0.

**CH<sub>3</sub>NH<sub>3</sub><sup>+</sup> (aq.).** The value for aqueous methylaminium ion is obtained from aqueous methylamine hydrochloride.

**CH<sub>3</sub>CN (g).** Thomsen<sup>15</sup> and Lemoult,<sup>1</sup> respectively, measured the heats of combustion of gaseous and of liquid acetonitrile, methylcyanide. Their data yield, for CH<sub>3</sub>CN (g),  $Q_f = -20.3$  and  $-17.9$ , respectively.

**CH<sub>3</sub>CN (liq.).** Kahlenberg<sup>1</sup> reported a value for the heat of vaporization.

**NH<sub>2</sub>CN (c).** Lemoult<sup>1, 6</sup> measured the heat of combustion of solid cyanamide.

**NH<sub>2</sub>CN (aq.).** Lemoult<sup>1, 6</sup> measured the heat of solution of solid cyanamide in water.

**NH<sub>2</sub>CN (liq.).** Pratolongo<sup>1</sup> measured the heat of fusion.

**NH<sub>4</sub>CN (aq.).** Berthelot<sup>27</sup> measured the heat of reaction of NH<sub>4</sub>OH (aq.) with HCN (aq.) to be 1.3.

**NH<sub>4</sub>CN (c).** Berthelot<sup>27</sup> measured the heat of solution of ammonium cyanide.

**CH<sub>3</sub>NC (liq.).** The data on the heat of combustion (see Kharasch<sup>1</sup>) of liquid methylisocyanide are: Lemoult,<sup>9</sup> 317.4; Guillemard,<sup>1</sup> 320.1.

**C<sub>2</sub>H<sub>5</sub>NH<sub>2</sub> (g).** Thomsen's<sup>15</sup> data on the heat of combustion of the gas yield, for gaseous ethylamine,  $Q_f = 13.0$ ; those of Lemoult<sup>2</sup> on the heat of combustion of the liquid yield  $Q_f = 13.3$ . See also Berthelot.<sup>75</sup>

**C<sub>2</sub>H<sub>5</sub>NH<sub>2</sub> (liq.).** Gautier (see Berthelot<sup>102</sup>) measured the heat of vaporization to be -6.5 at 15°. The vapor pressure data of Berthoud<sup>1</sup> and Pohland and Mehl<sup>1</sup> yield -6.75 and -6.53 at 15°

**C<sub>2</sub>H<sub>5</sub>NH<sub>2</sub> (aq.).** Data on the heat of solution of liquid ethylamine were reported by Baud, Ducelliez, and Gay,<sup>1</sup> Berthelot,<sup>75</sup> and Colson.<sup>1</sup>

**C<sub>2</sub>H<sub>5</sub>NH<sub>2</sub>·HCl (aq.).** Thomsen<sup>15</sup> measured the heat of reaction of aqueous ethylamine with aqueous HCl to be 13.44<sub>400</sub>.

**C<sub>2</sub>H<sub>5</sub>NH<sub>2</sub>·HCl (c).** Gautier<sup>2</sup> (see Berthelot<sup>151</sup>) measured the heat of solution of crystalline ethylamine hydrochloride.

**C<sub>2</sub>H<sub>5</sub>NH<sub>2</sub>·H<sup>+</sup> (aq.).** The value for aqueous ethylaminium ion is obtained from aqueous ethylamine hydrochloride.

**(CH<sub>3</sub>)<sub>2</sub>NH (g).** Thomsen<sup>15</sup> and Muller<sup>4</sup> measured the heat of com-

bustion of gaseous dimethylamine: Lemoult<sup>2</sup> that of the liquid. Their data yield, for  $(\text{CH}_3)_2\text{NH}$  (g),  $Q_f = 8.2, 2.0$ , and  $5.0$ , respectively.

$(\text{CH}_3)_2\text{NH}$  (liq.). Vapor pressure data were reported by Berthoud.<sup>1</sup>

$(\text{CH}_3)_2\text{NH}$  (aq.). We have estimated the heat of solution of dimethylamine.

$(\text{CH}_3)_2\text{NH} \cdot \text{HCl}$  (aq.). Thomsen measured the heat of reaction of  $(\text{CH}_3)_2\text{NH}$  (aq.) with  $\text{HCl}$  (aq.) to be  $11.81_{400}$ .

$(\text{CH}_3)_2\text{NH} \cdot \text{H}^+$  (aq.). The value for aqueous dimethylaminium ion is obtained from that for aqueous dimethylamine hydrochloride.

$\text{H}_2\text{NC} (: \text{NH}) \text{NHCN}$  (c). Lemoult<sup>1</sup> measured the heat of combustion of dicyandiamide.

$\text{H}_2\text{NC} (: \text{NH}) \text{NHCN}$  (aq.). Lemoult<sup>1</sup> measured the heat of solution of dicyandiamide.

$\text{NH}_4\text{CNO}$  (c). The equilibrium data of Walker and Wood<sup>1</sup> yield  $4.9$  for the heat of the reaction,  $\text{NH}_4\text{CNO}$  (c) =  $(\text{NH}_2)_2\text{CO}$  (c); whence, for  $\text{NH}_4\text{CNO}$  (c),  $Q_f = 73.6$ .

$\text{NH}_4\text{CNO}$  (aq.). Walker and Wood<sup>1</sup> measured the heat of solution of solid ammonium cyanate in water to be  $-6.23$ .

$\text{HCNO}$  (aq.). Berthelot<sup>27</sup> measured the heat of reaction of aqueous potassium cyanate with aqueous hydrochloric acid, and Lemoult<sup>1</sup> that of aqueous barium cyanate with aqueous nitric acid and with aqueous sulfuric acid.

$(\text{NH}_2)_2\text{CO}$  (c). The heat of combustion of urea was measured by Berthelot and Petit,<sup>1</sup> Emery and Benedict,<sup>1</sup> Krummacker,<sup>1</sup> and Stohmann and Langbein.<sup>2</sup>

$(\text{NH}_2)_2\text{CO}$  (aq.). The heat of solution of urea was measured by Thomsen,<sup>15</sup> Berthelot and Petit,<sup>5</sup> Matignon,<sup>1</sup> and Walker and Wood.<sup>1</sup> Data on the heat of dilution of aqueous urea were reported by Naudé,<sup>2</sup> Perman and Lovett,<sup>1</sup> and Fricke and Havestadt.<sup>1</sup>

$(\text{NH}_2)_2\text{CO} \cdot \text{HNO}_3$  (aq.). Thomsen<sup>15</sup> measured the heat of mixing aqueous urea with aqueous nitric acid.

$(\text{NH}_2)_2\text{CO} \cdot \text{HNO}_3$  (c). Matignon measured the heat of solution of urea nitrate.

$\text{HCONH}_2$  (liq.). The data of Stohmann and Schmidt<sup>4</sup> (see Karasch<sup>1</sup>) on the heat of combustion of liquid formamide yield  $Q_f = 62.1$ .

$\text{HCONH}_2$  (aq.). Calvet<sup>1, 2</sup> found  $Q = 6.73$  for the reaction,  $\text{HCONH}_2$  (200) +  $\text{NaOH}$  (200) =  $\text{HCOONa}$  (200) +  $\text{NH}_3$  (200); whence, for aqueous formamide,  $Q_f = 57.8$ . Berthelot found  $Q = 1.0$  for the reaction of  $\text{HCONH}_2$  (aq.) with  $\text{H}_2\text{O}$  (liq.); whence, for aqueous formamide,  $Q_f = 61.9$ .

$\text{CH}_3\text{CONH}_2$  (aq.). Calvet<sup>1, 2</sup> reported  $Q = 6.55$  for the reaction,  $\text{CH}_3\text{CONH}_2$  (200) +  $\text{NaOH}$  (200) =  $\text{CH}_3\text{COONa}$  (200) +  $\text{NH}_3$  (200); whence, for  $\text{CH}_3\text{CONH}_2$  (200),  $Q_f = 75.93$ .

$\text{CH}_3\text{CONH}_2$  (c). The data of Stohmann and Schmidt<sup>4</sup> and Berthelot and Fogh<sup>1</sup> on the heat of combustion of crystalline acetamide yield  $Q_f = 77.2$  and  $71.7$ , respectively. Speyers<sup>1</sup> measured the heat of solution

of crystalline acetamide in water to be  $-1.98$  at  $23^\circ$ , while Berthelot and Fogh<sup>1</sup> and Calvet<sup>1, 2</sup> found  $-1.85$  and  $-2.05_{200}^{17}$ , respectively. The last value yields, for  $\text{CH}_3\text{CONH}_2$  (c),  $Q_f = 77.98$ .

$\text{CH}_3\text{CONH}_2$  (liq.). Bridgman<sup>7</sup> reported a value for the heat of fusion.

$\text{CH}_3\text{NO}_2$  (liq.). Thomsen<sup>15</sup> measured the heat of combustion of gaseous nitromethane and Berthelot and Matignon<sup>7</sup> and Swietoslawski<sup>6</sup> that of liquid nitromethane. Their data yield, respectively, for  $\text{CH}_3\text{NO}_2$  (liq.),  $Q_f = 25.3, 27.6$ , and  $27.2$ .

$\text{CH}_3\text{NO}_2$  (g). For the heat of vaporization of nitromethane, the data are: Berthelot and Matignon,<sup>7</sup>  $-6.98$  at  $22^\circ$ ; Mathews,<sup>2</sup>  $-8.25$  at  $99^\circ$ . The vapor pressure data of Williams<sup>1</sup> are in accord with the latter value.

$\text{CH}_3\text{NO}_2$  (aq.). Berthelot and Matignon<sup>7</sup> measured the heat of solution of liquid nitromethane in water.

$\text{CH}_2\text{NO}_2^-$  (aq.). Berthelot and Matignon<sup>7</sup> measured the heat of solution of liquid nitromethane in aqueous KOH to be  $7.0$ .

$\text{HCOONH}_4$  (aq.). Berthelot<sup>11</sup> measured the heat of neutralization of aqueous formic acid with aqueous ammonia to be  $11.9_{200}^{10}$ .

$\text{HCOONH}_4$  (c). Berthelot<sup>11</sup> measured the heat of solution of ammonium formate.

$\text{NH}_4\text{HCO}_3$  (aq.). Berthelot<sup>4</sup> and Berthelot and Andre<sup>1</sup> reported values for the heat of neutralization of  $\text{NH}_4\text{OH}$  (aq.) with  $\text{H}_2\text{CO}_3$  (aq.). Data on the heat of dilution of ammonium bicarbonate were reported by Thomsen<sup>15</sup>.

$\text{NH}_4\text{HCO}_3$  (c). Berthelot and Andre<sup>1</sup> measured the heat of solution. Bonnier<sup>1</sup> measured the dissociation pressure.

$(\text{NH}_2)_2\text{C}(:\text{NH})\cdot\text{HNO}_3$  (c). Matignon<sup>1</sup> measured the heat of combustion of guanidine nitrate.

$(\text{NH}_2)_2\text{C}(:\text{NH})\cdot\text{HNO}_3$  (aq.). Matignon<sup>1</sup> measured the heat of solution of guanidine nitrate.

$(\text{NH}_2)_2\text{CNH}$  (aq.). Matignon<sup>1</sup> measured the heat of neutralization of aqueous guanidine nitrate to be  $14.1$ , whence, for aqueous guanidine,  $Q_f = 32.3$ .

$(\text{NH}_2)_2\text{CNH}$  (c). Matignon<sup>1</sup> measured the heat of solution of a sample of crystalline guanidine that contained nearly one-half mole of water to be  $1.23$ .

$(\text{NH}_4)_2\text{CO}_3$  (aq.). Thomsen<sup>15</sup> and Berthelot<sup>4</sup> measured the heat of neutralization of aqueous ammonia with aqueous carbon dioxide.

$\text{NH}_2\text{COONH}_4$  (aq.). Aqueous ammonium carbamate is taken equivalent to  $(\text{NH}_4)_2\text{CO}_3$  (aq.)  $-\text{H}_2\text{O}$  (liq.).

$\text{NH}_2\text{COONH}_4$  (c). The data on the heat of solution are: Matignon,<sup>9</sup>  $-3.80$  at  $15^\circ$ ; Raabe,<sup>1</sup>  $-3.45$ . Raabe<sup>1</sup> and Clark and Hetherington<sup>1</sup> reported for the heat of the reaction,  $2\text{NH}_3$  (g)  $+\text{CO}_2$  (g)  $=\text{NH}_2\text{COONH}_4$  (c),  $Q = 39.3$  and  $38.06$ , respectively, whence, for solid ammonium carbamate,  $Q_f = 160.7$  and  $159.45$ . Equilibrium data on this last reaction were reported by Briggs and Migrdichian,<sup>1</sup> Briner,<sup>1</sup> Matignon and Frejacques,<sup>1</sup> and Isambert.<sup>8</sup> See also Lecker<sup>1</sup> and Hori.<sup>1</sup>

$\text{HOCH}_2\text{CN}$  (liq.). Berthelot and Andre<sup>4</sup> measured the heat of combustion of liquid glycollic nitrile.

$\text{CH}_3\text{NCO}$  (liq.). Lemoult<sup>9</sup> measured the heat of combustion of liquid methyl isocyanate.

$\text{NH}_2\text{OCCOOH}$  (c). Matignon<sup>1</sup> and Stohmann and Haussmann<sup>1, 2</sup> found 128.6 and 132.6, respectively, for the heat of combustion of solid oxamic acid.

$\text{NH}_2\text{OCCOOH}$  (aq.). Matignon<sup>1</sup> measured the heat of solution of solid oxamic acid.

$\text{NH}_2\text{OCCOO}^-$  (aq.). Matignon<sup>1</sup> measured the heat of reaction of aqueous oxamic acid with aqueous potassium hydroxide.

$(\text{CONH}_2)_2$  (c). Stohmann and Haussmann<sup>1, 2</sup> measured the heat of combustion of solid oxamide.

$\text{NH}_2\text{OCNHCHO}$  (liq.). Matignon<sup>1</sup> measured the heat of combustion of liquid formylurea.

$\text{CH}_3\text{CHNOH}$  (c). Landrieu<sup>1</sup> (see Kharasch<sup>1</sup>) measured the heat of combustion of solid acetaldoxime.

$\text{CH}_2\text{OHCOONH}_4$  (aq.). de Forcrand<sup>3</sup> measured the heat of neutralization of aqueous glycollic acid with aqueous ammonia.

$\text{CH}_2\text{OHCOONH}_4$  (c). de Forcrand<sup>3</sup> measured the heat of solution of ammonium glycollate.

$\text{NH}_2\text{CH}_2\text{COOH}$  (c). The heat of combustion of aminoacetic acid, glycine, was measured by Stohmann and Langbein<sup>2</sup> and Wrede<sup>2</sup> to be 234.5 and 233.4, respectively.

$\text{NH}_2\text{CH}_2\text{COOH}$  (aq.). Louguinine<sup>1</sup> measured the heat of solution of solid aminoacetic acid, glycine.

$\text{NH}_2\text{CH}_2\text{COO}^-$  (aq.). Louguinine<sup>1</sup> found  $Q=2.97$  for the reaction of aqueous aminoacetic acid with aqueous  $\text{OH}^-$  to form aqueous glycinate, or aminoacetate, ion. Branch and Miyamoto,<sup>1</sup> from conductivity measurements, calculated the heat of ionization of aqueous aminoacetic acid into aqueous  $\text{H}^+$  and aqueous glycinate ion to be  $-10.70$ .

$\text{NH}_2\text{CH}_2\text{COOH} \cdot \text{H}^+$  (aq.). Branch and Miyamoto<sup>1</sup> calculated, from conductivity, data  $Q=-14.60$  for the reaction,  $\text{H}_2\text{O}$  (liq.) +  $\text{NH}_2\text{CH}_2\text{COOH}$  (aq.) =  $\text{OH}^-$  (aq.) +  $\text{NH}_2\text{CH}_2\text{COOH} \cdot \text{H}^+$  (aq.).

$\text{C}_2\text{H}_5\text{NO}_2$  (g). Thomsen<sup>15</sup> measured the heat of combustion of gaseous nitroethane, and Berthelot and Matignon<sup>6</sup> that of the liquid. Their data yield, for gaseous nitroethane,  $Q_f=22.2$  and  $27.7$ , respectively.

$\text{C}_2\text{H}_5\text{NO}_2$  (liq.). Berthelot and Matignon<sup>6</sup> measured the heat of vaporization of nitroethane.

$\text{C}_2\text{H}_5\text{NO}_2$  (aq.). We have estimated the heat of solution of liquid nitroethane.

$\text{C}_2\text{H}_4\text{NO}_2^-$  (aq.). Berthelot and Matignon<sup>6</sup> measured the heat of reaction of aqueous nitroethane with aqueous  $\text{OH}^-$  to be 10.1.

$\text{C}_2\text{H}_5\text{ONO}$  (g). Thomsen<sup>15</sup> measured the heat of combustion of gaseous ethyl nitrite to be 333.9; whence  $Q_f=25.9$ .

$\text{C}_2\text{H}_5\text{ONO}_2$  (g). Thomsen<sup>15</sup> measured the heat of combustion of gaseous ethyl nitrate to be 326.4; whence  $Q_f = 33.4$ .

$\text{C}_2\text{H}_5\text{ONO}_2$  (liq.). We have estimated the heat of vaporization of ethyl nitrate.

$\text{NH}_4\text{HC}_2\text{O}_4$  (aq.). Berthelot<sup>131</sup> measured the heat of reaction of  $\text{NH}_3$  (aq.) with  $\text{H}_2\text{C}_2\text{O}_4$  (aq.) to form aqueous ammonium acid oxalate. See also Andrews.<sup>11</sup>

$(\text{NH}_4)_2\text{C}_2\text{O}_4$  (aq.). Berthelot<sup>131</sup> measured the heat of neutralization of aqueous ammonia with aqueous oxalic acid.

$(\text{NH}_4)_2\text{C}_2\text{O}_4$  (c). Berthelot<sup>131</sup> measured the heat of solution of ammonium oxalate.

$(\text{NH}_4)_2\text{C}_2\text{O}_4 \cdot \text{H}_2\text{O}$  (c). Berthelot<sup>131</sup> measured the heat of solution of ammonium oxalate monohydrate.

$\text{C}_2\text{H}_5\text{NHNNO}_2$  (liq.). Swarts<sup>4, 5</sup> (see Kharasch<sup>1</sup>) measured the heat of combustion of ethylnitroamine.

$(\text{CH}_3)_2\text{NNO}_2$  (liq.). Swietoslawski<sup>6</sup> measured the heat of combustion of liquid dimethylnitrosoamine.

$\text{CH}_3\text{NH}_2 \cdot \text{H}_2\text{CO}_3$  (aq.). Muller<sup>6</sup> measured the heat of reaction of 1 mole of aqueous methylamine with 1 mole of aqueous carbon dioxide.

$\text{CH}_3\text{COONH}_4$  (aq.). The heat of neutralization of aqueous acetic acid with aqueous ammonia was measured by Thomsen,<sup>15</sup> Berthelot,<sup>9, 81</sup> and Andrews.<sup>11</sup> Data on the heat of dilution of aqueous ammonium acetate were reported by Thomsen<sup>15</sup> and Dunnington and Hoggard.<sup>1</sup>

$\text{CH}_3\text{COONH}_4$  (c). Berthelot<sup>131</sup> measured the heat of solution of ammonium acetate.

$(\text{CH}_2\text{NH}_2)_2 \cdot \text{H}_2\text{O}$  (c). Berthelot<sup>118</sup> measured the heat of combustion of solid ethylene diamine monohydrate.

$(\text{CH}_2\text{NH}_2)_2$  (aq.). Berthelot<sup>118</sup> measured the heat of solution of ethylene diamine monohydrate in water to be  $5.08_{1000}^{25}$ .

$(\text{CH}_2\text{NH}_2)_2 \cdot 2 \text{HCl}$  (aq.). Berthelot<sup>118</sup> measured the heat of reaction of aqueous ethylene diamine with  $2 \text{HCl}$  (aq.) to be 23.2; Colson and Darzen<sup>1</sup> found 23.5.

$(\text{CH}_2\text{NH}_2)_2 \cdot 2 \text{HCl}$  (c). Berthelot<sup>118</sup> and Colson and Darzen<sup>1</sup> measured the heat of solution of ethylene diamine dihydrochloride to be  $-6.65^{25}$  and  $-7.6$ , respectively.

$(\text{CH}_2\text{NH}_2)_2 \cdot 2 \text{HNO}_3$  (aq.). Berthelot<sup>118</sup> measured the heat of reaction of aqueous ethylene diamine with  $2 \text{HNO}_3$  (aq.) to be 23.2.

$(\text{CH}_2\text{NH}_2 \cdot \text{H})_2^{++}$  (aq.). The value for aqueous ethylene diaminium ion is obtained from aqueous ethylene diamine dihydrochloride.

$\text{CH}_2\text{FONH}_2$  (c). Swarts<sup>5</sup> (see Kharasch<sup>1</sup>) measured the heat of combustion of monofluoroacetamide.

$\text{CNCl}$  (liq.). Berthelot<sup>27</sup> found  $Q = 61.7$  for the reaction,  $\text{CNCl}$  (liq.)  $+ 2 \text{H}_2\text{O}$  (liq.)  $= (\text{NH}_4\text{Cl} + \text{CO}_2)$  (aq.).

$\text{CNCl}$  (g). Berthelot<sup>27</sup> measured the heat of vaporization. Vapor pressure data were reported by Regnault.<sup>6</sup>

$\text{CH}_2\text{ClCOONH}_4$  (aq.). Rivals<sup>1</sup> measured the heat of neutralization of aqueous monochloroacetic acid with aqueous ammonia.

$\text{CCl}_3\text{COONH}_4$  (aq.). Rivals<sup>1</sup> measured the heat of neutralization of aqueous trichloroacetic acid with aqueous ammonia.

$\text{CH}_2\text{ClCONH}_2$  (c). Rivals<sup>1</sup> measured the heat of combustion of monochloroacetamide.

$\text{CH}_2\text{ClCONH}_2$  (aq.). Calvet<sup>2</sup> measured the heat of reaction of aqueous monochloroacetamide with aqueous KOH to be 9.01.

$\text{CHCl}_2\text{CONH}_2$  (aq.). Calvet<sup>2</sup> measured the heat of reaction of aqueous dichloroacetamide with aqueous NaOH to be 10.12.

$\text{CCl}_3\text{CONH}_2$  (c). Rivals<sup>3, 4</sup> measured the heat of combustion of trichloroacetamide.

$\text{CCl}_3\text{CONH}_2$  (aq.). Calvet<sup>2</sup> measured the heat of reaction of aqueous trichloroacetamide with aqueous NaOH to be 19.71.

$\text{CHF}_2\text{CH}_2\text{NH}_2$  (liq.). Swarts<sup>4, 5</sup> measured the heat of combustion of liquid difluoroethylamine.

$\text{CHF}_2\text{CH}_2\text{NHNO}_2$  (c). Swarts<sup>4, 5</sup> measured the heat of combustion of solid difluoroethylnitroamine.

$\text{CNI}$  (aq.). Berthelot<sup>27</sup> found  $Q = 6.4$  for the reaction,  $\text{KCN}$  (aq.) +  $\text{I}_2$  (c) =  $(\text{CNI} + \text{KI})$  (aq.).

$\text{CNI}$  (c). Berthelot<sup>27</sup> measured the heat of solution.

$\text{CNS}^-$  ( $\infty$ ). This value is obtained from those for  $\text{NaCNS}$  ( $\infty$ ) and  $\text{KCNS}$  ( $\infty$ ).

$\text{NH}_4\text{CNS}$  (aq.). This value is obtained from those for the aqueous ions.

$\text{NH}_4\text{CNS}$  (c). Berthelot<sup>9</sup> measured the heat of solution of ammonium thiocyanate. Matignon<sup>1</sup> measured the heat of combustion.

$(\text{NH}_2)_2\text{CS}$  (c). Matignon<sup>1</sup> measured the heat of combustion of thiourea.

$(\text{NH}_2)_2\text{CS}$  (aq.). Matignon<sup>1</sup> measured the heat of solution of solid thiourea.

$(\text{NH}_2)_2\text{CS} \cdot \text{HNO}_3$  (aq.). Matignon<sup>1</sup> measured the heat of mixing aqueous thiourea with aqueous nitric acid to be 0.07.

$(\text{NH}_2)_2\text{CS} \cdot \text{HNO}_3$  (c). Matignon<sup>1</sup> measured the heat of solution of thiourea nitrate.

$(\text{C}_2\text{H}_5)_3\text{PO}_4$  (liq.). Cavalier<sup>1</sup> measured the heat of reaction of  $\text{POCl}_3$  (liq.) with 3  $\text{NaC}_2\text{H}_5\text{O}$  (benzene) to be 109.8.

$\text{CH}_3\text{CNS}$  (g). The data of Thomsen<sup>15</sup> on the heat of combustion of gaseous methyl thiocyanate yield, for  $\text{CH}_3\text{CNS}$  (g),  $Q_f = -36.2$ .

$\text{CH}_3\text{CNS}$  (liq.). The data of Berthelot<sup>120</sup> on the heat of combustion of liquid methyl thiocyanate yield, for  $\text{CH}_3\text{CNS}$  (liq.),  $Q_f = -18.5$ .

$\text{CH}_3\text{NCS}$  (g). The data of Thomsen<sup>15</sup> on the heat of combustion of gaseous methyl isothiocyanate yield, for  $\text{CH}_3\text{NCS}$  (g),  $Q_f = -29.3$ .

$\text{CH}_3\text{NCS}$  (c). The data of Berthelot<sup>120</sup> on the heat of combustion of solid methyl isothiocyanate yield, for  $\text{CH}_3\text{NCS}$  (c),  $Q_f = -8.3$ .

## SILICON

**Si (c).** Standard state.

**Si (amorphous).** The data of von Wartenberg,<sup>2</sup> who measured the heats of combustion of both the crystalline and amorphous forms of silicon, yield for the latter  $Q_f = -1.0$ .

**Si (g).** von Wartenberg<sup>2</sup> considered the vapor to be polyatomic and gave  $-44$  as the heat of sublimation. Recently Ruff and Kenschak<sup>1</sup> measured what they believed to be the vapor pressure of silicon, and deduced the heat of sublimation to be  $-85$  at  $18^\circ$ . The heat of sublimation of silicon can also be computed by utilizing the lattice energy of  $\text{SiO}_2$ , which is  $3247$  according to Hylleraas,<sup>2</sup> but the value obtained is a small difference of very large numbers and the uncertainty may be as much as  $200$ .

The energy states of gaseous monatomic silicon are taken from the following works: first spectra, Fowler<sup>2, 4</sup>; second, Fowler<sup>5</sup> and Bowen<sup>4</sup>; third, Fowler<sup>5</sup> and Sawyer and Paschen<sup>1</sup>; fourth, Fowler<sup>5</sup>; fifth, Edlen and Ericson.<sup>1</sup>

**$\text{SiO}_2$  (solid).** The heat of combustion of silicon to form silicon dioxide was measured by Potter,<sup>1</sup> von Wartenberg,<sup>2</sup> and Roth,<sup>4</sup> who found, respectively,  $Q = 215, 195$ , and  $204.0$ . Mixer<sup>5</sup> measured the heats of the reactions,  $\text{Si (c)} + 2 \text{Na}_2\text{O}_2 \text{ (c)} = \text{Na}_2\text{SiO}_3 \text{ (c)} + \text{Na}_2\text{O (c)}$  and  $\text{SiO}_2 \text{ (gls.)} + \text{Na}_2\text{O (c)} = \text{Na}_2\text{SiO}_3 \text{ (solid, fused)}$ , to be  $234.6$  and  $73.27$ , respectively; whence, for  $\text{Si (c)} + 2 \text{Na}_2\text{O}_2 \text{ (c)} = \text{SiO}_2 \text{ (gls.)} + 2 \text{Na}_2\text{O (c)}$ ,  $Q = 161.0$ , and for  $\text{SiO}_2 \text{ (gls.)}$ ,  $Q_f = 200.8$ . The various solid forms of  $\text{SiO}_2$  are silica glass,  $\alpha$  and  $\beta$  quartz,  $\alpha$  and  $\beta$  cristobalite, and tridymite. The thermal properties of the various forms are determined from data on their heats of solution in concentrated aqueous  $\text{HF}$  which have been obtained by Mulert,<sup>1</sup> Ray,<sup>1</sup> Wietzel,<sup>1</sup> and from data on heat capacities which have been obtained by Wietzel,<sup>1</sup> Cohn,<sup>1</sup> Neumann,<sup>1</sup> Perrier and Roux,<sup>1</sup> and White.<sup>1</sup> The values we have selected for the heats of solution in 35% aqueous  $\text{HF}$  are:  $\text{SiO}_2 \text{ (gls.)}$ ,  $36.98$ ;  $\text{SiO}_2 \text{ (quartz)}$ ,  $33.65$ ;  $\text{SiO}_2 \text{ (colloid)}$ ,  $38.9$ .

**$\text{SiO}_2$  (liq.).** From melting point curves, Kracek<sup>1</sup> calculated the heat of fusion of cristobalite to be  $-1.84$  at  $1530^\circ$ .

**$\text{SiO}_2$  (g).** Ruff and Schmidt<sup>1</sup> measured the vapor pressure of silica. Their data, which are not very concordant, yield a value of about  $-79$  for the heat of vaporization at  $1900^\circ$ .

**$\text{H}_2\text{SiF}_6 \text{ (aq.)}$ .** The heat of solution of silica glass in aqueous  $\text{HF}$  varies considerably with the concentration of the acid, as shown by the following data: Ray,<sup>1</sup>  $37.24$  in 35%  $\text{HF}$ ; Mulert,<sup>1</sup>  $32.14$  in 20%  $\text{HF}$ ; Wietzel,<sup>1</sup>  $35.97$  in 35%  $\text{HF}$ , and  $38.8$  in fuming  $\text{HF}$ . Mulert<sup>1</sup> measured the heat of solution of silica containing various amounts of water in the same acid used for the solution of silica glass, and found that beyond  $\text{SiO}_2 \cdot 50 \text{H}_2\text{O}$ , the heat of solution was constant and equal to  $33.6$  in 20%  $\text{HF}$ . Mulert<sup>1</sup> also measured the heat of solution of the same hydrated material in exactly 6 moles of dilute acid, obtaining  $32.3$ .

From these data we have computed  $Q=30.7$  for the reaction,  $\text{SiO}_2$  (gls.)  $+6\text{HF}$  (6)  $=\text{H}_2\text{SiF}_6$  (aq.), whence, for  $\text{H}_2\text{SiF}_6$  (aq.),  $Q_f=547.8$ .

**$\text{SiF}_4$  (g).** The data of von Wartenberg and Schutte,<sup>1</sup> who measured directly the heat of formation of this substance, give for  $\text{SiF}_4$  (g),  $Q_f=359.7$  Truchot<sup>1, 2, 3</sup> measured the heat of solution of  $\text{SiF}_4$  (g) in 2 moles of aqueous HF to be 34.0; Guntz<sup>1</sup> found 33.50. Selecting the value 33.8, we have computed, for  $\text{SiF}_4$  (g),  $Q_f=363.0$ .

Johnson and Jenkins<sup>1</sup> reported a critical potential of 5.03 volt-electrons for the  $\text{SiF}_4$  molecule, but the excited state is not known.

**$\text{SiF}_4$  (liq.),  $\text{SiF}_4$  (c).** The vapor pressure data of Patnode and Papish,<sup>1</sup> Ruff and Ascher,<sup>1</sup> and LeBoucher, Fischer, and Biltz<sup>1</sup> yield  $-4.46$ <sup>-90</sup> for the heat of vaporization and  $-6.16$ <sup>-95</sup> for the heat of sublimation.

**$\text{SiO}_2 \cdot n\text{H}_2\text{O}$  (c).** Silicic acids of almost every possible composition have been described, but there seems to be no evidence that these substances are definite compounds. Mulert<sup>1</sup> measured the heats of solution of the hydrates ranging in composition from  $\text{SiO}_2 \cdot \text{H}_2\text{O}$  to  $\text{SiO}_2 \cdot 86.6 \text{H}_2\text{O}$ , and found no break in the curve representing the relation between the heat of solution and the number of moles of water in the so-called hydrates. On the other hand, Thiessen and Koerner<sup>1</sup> obtained some vapor pressure evidence indicating the existence of the hydrates containing  $\frac{1}{2}$ , 1,  $1\frac{1}{2}$ , and 2 moles of water. Their data yield 12.7, 10.9, 10.1, and 8.7 for the respective heats of dissociation per mole of water vapor.

**$\text{SiH}_4$  (g).** Ogier<sup>1</sup> measured the heat of combustion to be 324.3, whence, for  $\text{SiH}_4$  (g),  $Q_f=13.7$ . The equilibrium data of von Wartenberg<sup>2</sup> yield  $Q_f=8.7$ .

**$\text{SiH}_4$  (liq.).** Wintgen<sup>1</sup> reported  $-3.03$  for the heat of vaporization of the liquid at the boiling point,  $-112^\circ$ .

**$\text{Si}_n\text{H}_{2n+2}$  (g).** Wintgen<sup>1</sup> reported the heats of vaporization for  $\text{Si}_2\text{H}_6$ ,  $\text{Si}_3\text{H}_8$ , and  $\text{Si}_4\text{H}_{10}$ .

**$\text{SiCl}_4$  (liq.).** Troost and Hautefeuille<sup>4, 5</sup> measured the heat of the direct combination of amorphous silicon and gaseous chlorine to form liquid silicon tetrachloride, reporting  $Q=157.6$ . Berthelot<sup>50</sup> reviewed their data and deduced  $Q=150.1$ , by making some calorimetric corrections to their data. For the heat of the reaction,  $\text{SiCl}_4$  (liq.)  $+2\text{H}_2\text{O}$  (liq.)  $=\text{SiO}_2$  (aq., colloid)  $+4\text{HCl}$  (aq.), the following values were reported: Troost and Hautefeuille,<sup>3, 5</sup> 70.0; Roth and Schwartz,<sup>1</sup> 70.1; Berthelot,<sup>50</sup> 69.7; Thomsen,<sup>15</sup> 69.3. From these data, we have computed, for  $\text{SiCl}_4$  (liq.),  $Q_f=150.1$ .

**$\text{SiCl}_4$  (g).** The calorimetric data on the heat of vaporization of the liquid at  $57^\circ$  are: Ogier,<sup>1</sup>  $-6.3$ ; Stock, Somiesky, and Wintgen,<sup>1</sup>  $-7.19$ ; Wintgen,<sup>1</sup>  $-7.19$ . These values are in accord with the vapor pressure data of Regnault<sup>6</sup> and Becker and Meyer.<sup>1</sup> Kahlenberg and Koenig<sup>1</sup> deduced  $-6.2$  by an uncertain method.

**$\text{SiCl}_4$  (c).** Latimer<sup>1</sup> found  $F=-1.85$  at  $-70^\circ$ .

**SiBr<sub>4</sub> (liq.).** Berthelot<sup>50</sup> found the heat of reaction of this substance with water to be 83.0, whence, for SiBr<sub>4</sub> (liq.),  $Q_f = 93.6$ .

**SiI<sub>4</sub> (c).** Berthelot<sup>50</sup> found the heat of reaction of this substance with water to be 85.7, which gives, for SiI<sub>4</sub> (c),  $Q_f = 29.8$ .

**SiH<sub>2</sub>Cl<sub>2</sub> (g).** Stock and Somieski<sup>3</sup> reported  $V = -6.1^{12}$ .

**SiH<sub>3</sub>Cl (g).** Stock and Somieski<sup>3</sup> reported  $V = -5.1^{10}$ .

**SiH<sub>2</sub>Br<sub>2</sub> (g).** Stock and Somieski<sup>2</sup> reported  $V = -7.4^{66}$ .

**SiH<sub>3</sub>Br (g).** Stock and Somieski<sup>1</sup> reported  $V = -5.85^2$ .

**(SiCl<sub>3</sub>)<sub>2</sub>O (g).** Stock, Somieski, and Wintgen<sup>1</sup> reported  $V = -9.4^{137}$ .

**Si<sub>2</sub>Cl<sub>6</sub> (g).** Guinchant<sup>4, 5</sup> reported  $V = -11.0^{139}$ .

**Si<sub>3</sub>Cl<sub>8</sub> (g).** Guinchant<sup>4, 5</sup> reported  $V = -12.1^{213}$ .

**SiS<sub>2</sub> (c).** Sabatier<sup>1</sup> measured the heat of the reaction  $\text{SiS}_2 (\text{c}) + 2\text{H}_2\text{O} (\text{liq.}) = \text{SiO}_2 (\text{colloid, aq.}) + 2\text{H}_2\text{S} (\text{g})$ , finding  $Q^{9,5} = 38.8$  and 54.0, respectively, for white and yellow SiS<sub>2</sub>.

**Si<sub>3</sub>N<sub>4</sub> (c).** Hincke and Brantley,<sup>1</sup> from their equilibrium data on the reaction,  $\text{Si}_3\text{N}_4 (\text{c}) = 3\text{Si} (\text{c}) + 2\text{N}_2 (\text{g})$ , computed  $Q^{1600} = -176.3$ , which gives  $Q_f = 157$ . Matignon<sup>10, 13</sup> measured the equilibrium  $3\text{SiO}_2 (\text{c}) + 6\text{C} (\text{amorphous}) + 2\text{N}_2 (\text{g}) = \text{Si}_3\text{N}_4 (\text{c}) + 6\text{CO} (\text{g})$ , and computed, with the aid of the Nernst equation,  $Q = -203$ , whence, for Si<sub>3</sub>N<sub>4</sub> (c),  $Q_f = 230$ .

**(NH<sub>4</sub>)<sub>2</sub>SiF<sub>6</sub> (aq.).** Truchot<sup>3</sup> found  $Q = 31.2^{20}$  for the reaction  $\text{SiF}_4 (\text{g}) + 2\text{NH}_4\text{F} (\text{aq.}) = (\text{NH}_4)_2\text{SiF}_6 (\text{aq.})$ .

**(NH<sub>4</sub>)<sub>2</sub>SiF<sub>6</sub> (c).** Truchot<sup>3</sup> measured the heat of solution.

**(C<sub>2</sub>H<sub>5</sub>O)<sub>4</sub>Si (liq.).** Ogier<sup>1</sup> measured the heat of hydrolysis of this substance to be 21.6.

**(CH<sub>3</sub>O)<sub>4</sub>Si (g).** Kahlenberg and Koenig<sup>1</sup> reported  $V = -7.08^{121}$ .

**SiC (c).** von Wartenberg and Schutte<sup>1</sup> measured the heat of the reaction of gaseous fluorine with silicon carbide to be 491.3, from which we find  $Q_f = 30$ . The data of Mixer<sup>5</sup> yield for the reactions,  $\text{SiC} (\text{c}) + 4\text{Na}_2\text{O}_2 (\text{c}) = \text{Na}_2\text{SiO}_3 (\text{gls.}) + \text{Na}_2\text{CO}_3 (\text{c}) + 2\text{Na}_2\text{O} (\text{c})$  and  $\text{Si} (\text{c}) + 2\text{Na}_2\text{O}_2 (\text{c}) = \text{Na}_2\text{SiO}_3 (\text{gls.}) + \text{Na}_2\text{O} (\text{c})$ ,  $Q = 365.9$  and 234.6, respectively. The difference gives for  $\text{SiC} (\text{c}) + 2\text{Na}_2\text{O}_2 (\text{c}) = \text{Si} (\text{c}) + \text{Na}_2\text{CO}_3 (\text{c}) + \text{Na}_2\text{O} (\text{c})$ ,  $Q = 131.3$ , from which, for SiC (c),  $Q_f = 0.2$ . The vapor pressure data of Ruff and Konschak<sup>1</sup> yield the approximate value,  $Q_f = 25$ . The equilibrium data of Baure and Brunner<sup>1</sup> yield the estimated value 36. Ruff and Grieger<sup>1</sup> measured the heats of the reactions studied by Mixer<sup>5</sup> (see above) and found  $Q = 375.1$  and 259.3, respectively. The differences give, for  $\text{SiC} (\text{c}) + 2\text{Na}_2\text{O}_2 (\text{c}) = \text{Si} (\text{c}) + \text{Na}_2\text{CO}_3 (\text{c}) + \text{Na}_2\text{O} (\text{c})$ ,  $Q = 115.8$ , from which, for SiC (c),  $Q_f = 15.7$ .

#### GERMANIUM

**Ge (c).** Standard state.

**Ge (g).** We have estimated the heat of sublimation to be -85. The energy states of monatomic gaseous germanium are evaluated from the data of Rao,<sup>4</sup> Gartlein,<sup>1</sup> Lang,<sup>1</sup> and Rao and Narayan.<sup>2</sup>

**GeO<sub>2</sub> (colloid, aq.).** We have estimated  $Q_f = 230$ .

**GeCl<sub>4</sub> (liq.).** Roth and Schwartz<sup>1</sup> measured the heat of solution of this substance in water to be 25, whence, for GeCl<sub>4</sub> (liq.),  $Q_f = 226.1$ .

**GeCl<sub>4</sub> (g).** The vapor pressure data of Nilson and Petterson<sup>1</sup> yield  $-9.2^{86}$  for the heat of vaporization of the liquid.

**Ge<sub>2</sub>H<sub>6</sub> (g).** Dennis, Corey, and Moore<sup>1</sup> reported  $V = -6.3^{29}$ .

**Ge<sub>3</sub>H<sub>8</sub> (g).** Dennis, Corey, and Moore<sup>1</sup> reported  $V = -7.6^{111}$ .

## TIN

**Sn (c).** The three solid forms of tin are: I, rhombic, white; II, tetragonal, white; III, cubic, gray. The transition temperatures are respectively  $161^\circ$  and  $18^\circ$ . We have selected Sn (c, II, tetragonal) as the standard state. For the heat of transition of III to II, the data are: Brönsted,<sup>6</sup>  $-0.53$ ; Cohen,<sup>3</sup>  $-0.73$ ; Meyer,<sup>1</sup>  $-1.13$ . For the heat of transition from II to I, Werner<sup>2</sup> reported  $-0.002$ .

**Sn (liq.).** The data on the heat of fusion of tin at the melting point,  $232^\circ$ , are: Awbery and Griffiths,<sup>1</sup>  $-1.73$ ; Iitaka,<sup>1</sup>  $-1.59$ ; Umino,<sup>3</sup>  $-1.69$ ; Person,<sup>2</sup>  $-1.69$ ; Rudberg,<sup>1</sup>  $-1.58$ ; Mazzotto,<sup>3</sup>  $-1.61$ ; Spring,<sup>1</sup>  $-1.74$ ; Guinchant,<sup>5</sup>  $-1.70$ ; Pionchon,<sup>1</sup>  $-1.73$ ; Robertson,<sup>1</sup>  $-1.66$ .

**Sn (g).** Vapor pressure data on liquid tin were obtained by Ruff and Bergdahl,<sup>1</sup> Greenwood,<sup>2, 3, 5, 6</sup> van Liempt,<sup>2</sup> von Wartenberg,<sup>9</sup> and Harteck.<sup>1</sup> The data are discordant. We have taken  $-75$  as the best value for the heat of vaporization of the liquid and have assumed the vapor to be monatomic.

Values for the energy states of monatomic gaseous Sn are taken from the following: Bach,<sup>3</sup> Green and Loring,<sup>1</sup> Narayan and Rao,<sup>1</sup> Randall and Wright,<sup>1</sup> Carroll,<sup>1</sup> Rao,<sup>1</sup> Gibbs and White,<sup>2</sup> Gibbs and Vieweg,<sup>1</sup> Lang,<sup>2</sup> and Rao, Narayan, and Rao.<sup>1</sup>

**SnH<sub>4</sub> (liq.).** From vapor pressure data, Paneth, Haken, and Rabinowitsch<sup>1</sup> computed  $V = -4.55^{150}$ .

**SnO<sub>2</sub> (c, III).** For the heat of combustion of tin to form SnO<sub>2</sub>, the data are: Dulong,<sup>2</sup> 145; Andrews,<sup>14</sup> 136; Mixter,<sup>7</sup> 137.8; Moose and Parr,<sup>1</sup> 138.8. From data on the entropies of SnO<sub>2</sub>, Sn, and O<sub>2</sub>, and the free energy of formation of SnO<sub>2</sub>, Millar<sup>5</sup> computed, for SnO<sub>2</sub> (c, III),  $Q_f = 137.8$ .

**SnO<sub>2</sub> (c, I), SnO<sub>2</sub> (c, II).** Laschtschenko<sup>1</sup> found the heats of transition of III to II and II to I to be  $-0.45^{430}$  and  $-0.30^{540}$ , respectively.

**SnO (c).** For the heat of oxidation of SnO to form SnO<sub>2</sub>, the data are: Mixter,<sup>7</sup> 70.4; Andrews,<sup>14</sup> 69.6; Dulong,<sup>2</sup> 71. Using Mixter's value of 70.4, we have computed, for SnO,  $Q_f = 67.7$ . Equilibrium measurements involving SnO were made by Maeda,<sup>1</sup> Fraenkel and Snipischski,<sup>1</sup> Rosenhain,<sup>1</sup> and Eastman and Robinson.<sup>1</sup>

**SnCl<sub>2</sub> (aq. HCl).** Thomsen<sup>15</sup> measured the heat of the reaction,  $\text{SnCl}_2 (\text{aq. HCl}) + \text{Zn (c)} = \text{ZnCl}_2 (\text{aq. HCl}) + \text{Sn (c)}$ , finding  $Q = 33.0, 33.5, 33.0, 33.2, 30.2, 30.5, 28.9, \text{ and } 30.9$ . Disregarding the four low values, we have computed, for SnCl<sub>2</sub> (aq. HCl),  $Q_f = 81.5$ .

**SnCl<sub>2</sub> (c).** The data on the heat of solution are: Thomsen,<sup>15</sup> 0.35; Biltz and Fischer,<sup>2</sup> 0.8; Berthelot,<sup>50</sup> 0.40.

**SnCl<sub>2</sub> · 2H<sub>2</sub>O (c).** The data on the heat of solution are: Thomsen,<sup>15</sup> -5.29<sub>200</sub>; Berthelot,<sup>131</sup> -5.26.

**SnCl<sub>2</sub> (g).** For the heat of vaporization of stannous chloride, Maier<sup>6</sup> reported -21.1 at 623°.

**SnCl<sub>4</sub> (aq. HCl).** Thomsen's<sup>15</sup> data on the reaction, SnCl<sub>2</sub> (aq. HCl) + HCl (aq.) + HClO (aq.) = SnCl<sub>4</sub> (aq. HCl) + H<sub>2</sub>O (liq.), yield  $Q = 74.97$ ; whence, for SnCl<sub>4</sub> (aq. HCl),  $Q_f = 157.34$ . Thomsen<sup>15</sup> also measured the heat of oxidation of SnCl<sub>2</sub> (aq. HCl) with aqueous HIO<sub>3</sub> and with aqueous H<sub>2</sub>O<sub>2</sub>. His data yield,  $Q = 155.50$  and  $88.74$ , respectively; whence, for SnCl<sub>4</sub> (aq. HCl),  $Q_f = 157.66$  and  $158.1$ . The last value is not given great weight because the reaction involving H<sub>2</sub>O<sub>2</sub> may not be clear cut. Berthelot<sup>26</sup> measured the heat of the reaction SnCl<sub>2</sub> (aq. HCl) + Cl<sub>2</sub> (g) = SnCl<sub>4</sub> (aq. HCl). His data yield  $Q = 76.0$ ; whence, for SnCl<sub>4</sub> (aq. HCl),  $Q_f = 157.5$ .

**SnCl<sub>4</sub> (liq.).** Thomsen<sup>15</sup> found the heat of solution of liquid stannic chloride to be  $29.92^{20}$ ; Berthelot<sup>50</sup> found  $28.5$ .

**SnCl<sub>4</sub> (c).** Latimer<sup>1</sup> measured the heat of fusion to be  $-2.20^{33}$ .

**SnCl<sub>4</sub> (g).** The heat of vaporization of liquid stannic chloride was measured by Kahlenberg and Koenig,<sup>1</sup> Hammick,<sup>1</sup> and Andrews.<sup>10</sup> Vapor pressure data were obtained by Regnault,<sup>6</sup> Mundel,<sup>1</sup> and Young.<sup>2</sup> For the heat of vaporization, Andrews<sup>10</sup> found  $-8.0$  and Hammick<sup>1</sup>  $-8.5$ ; Young<sup>2</sup> calculated  $-9.0$ .

**Sn(OH)<sub>2</sub> (c).** Thomsen<sup>15</sup> reported  $Q = 24.72$  for the reaction, SnCl<sub>2</sub> (aq.) + 2NaOH (aq.) = 2NaCl (aq.) + Sn(OH)<sub>2</sub> (c). This gives, for the freshly precipitated stannous hydroxide,  $Q_f = 136.1$ .

**Sn(OH)<sub>4</sub> (c).** Thomsen<sup>15</sup> reported  $Q = 51.87$  for the reaction, SnCl<sub>4</sub> (aq.) + 4NaOH (aq.) = 4NaCl (aq.) + Sn(OH)<sub>4</sub> (c). This gives, for the freshly precipitated stannic hydroxide,  $Q_f = 268.9$ .

**SnBr<sub>2</sub> (c).** By means of "double decomposition" or "reciprocal pair" experiments Berthelot<sup>50</sup> found, for SnCl<sub>2</sub> (c) + 2KBr (aq.) = SnBr<sub>2</sub> (c) + 2KCl (aq.),  $Q = 2.20$ ; whence, for SnBr<sub>2</sub> (c),  $Q_f = 61.4$ .

**SnBr<sub>2</sub> (aq.).** The data on the heat of solution of SnBr<sub>2</sub> (c) are: Berthelot,<sup>50</sup>  $1.6$ ; Biltz and Fischer,<sup>2</sup>  $1.6$ .

**SnI<sub>2</sub> (c).** In a manner similar to that for stannous bromide, Berthelot<sup>50</sup> found, for SnCl<sub>2</sub> (c) + 2KI (aq.) = SnI<sub>2</sub> (c) + 2KCl (aq.),  $Q = 4.0$ ; whence, for SnI<sub>2</sub> (c),  $Q_f = 38.9$ .

**SnI<sub>2</sub> (aq.).** Mosnier<sup>1</sup> found the heat of solution of SnI<sub>2</sub> (c) to be  $0.61$ .

**H<sub>2</sub>SnF<sub>6</sub> (aq.).** For the reaction, SnCl<sub>4</sub> (aq. HCl) + 6HF (aq.) = (H<sub>2</sub>SnF<sub>6</sub> + 4HCl) (aq.), Thomsen<sup>15</sup> found  $Q = 17.6$ . This gives, for H<sub>2</sub>SnF<sub>6</sub> (aq.)  $Q_f = 470.4$ .

**SnF<sub>6</sub><sup>-</sup> (aq.).** Assuming the heat of neutralization of aqueous H<sub>2</sub>SnF<sub>6</sub> to be the same as that for H<sub>2</sub>SiF<sub>6</sub>,  $26.6$ , we have computed, for SnF<sub>6</sub><sup>-</sup> (aq.),  $Q_f = 469.8$ .

**SnBr<sub>4</sub> (c).** Berthelot<sup>50</sup> measured the heat of mixing SnCl<sub>4</sub> (liq.) with

4KBr (aq.), and of  $\text{SnBr}_4$  (c) with 4KCl (aq.), to be 28.1 and 16.8, respectively. The difference gives, for  $\text{SnCl}_4$  (liq.) + 4KBr (aq.) =  $\text{SnBr}_4$  (c) + 4KCl (aq.),  $Q = 11.3$ , from which we have computed, for  $\text{SnBr}_4$  (c),  $Q_f = 94.8$ .

**$\text{SnBr}_4$  (aq.).** For the heat of solution of solid stannic bromide the data are: Berthelot,<sup>50</sup> 17.6<sub>800</sub><sup>10</sup>; Pickering,<sup>12</sup> 15.54<sub>1000</sub><sup>15</sup>. Using the value 15.5, one finds, for  $\text{SnBr}_4$  (aq.),  $Q_f = 110.3$ . Herschkowitsch<sup>2</sup> measured the heat of solution of tin in a saturated aqueous solution of KBr + Br<sub>2</sub>, to form  $\text{SnBr}_4$  (aq.), to be 110.2.

**$\text{SnBr}_4$  (liq.).** The data on the heat of fusion of solid stannic bromide are: Tolloczko,<sup>1</sup> -2.74; Garelli,<sup>1</sup> -2.84; Raoult,<sup>1</sup> -3.14; Berthelot,<sup>50</sup> -3.10; Pickering,<sup>12</sup> -2.97.

**$\text{SnBr}_4 \cdot 8\text{H}_2\text{O}$  (c).** Pickering<sup>12</sup> measured the heat of solution.

**$\text{SnBr}_4 \cdot 8\text{H}_2\text{O}$  (liq.).** Pickering<sup>12</sup> measured the heat of fusion of the solid octahydrate.

**$\text{SnS}$  (c).** There are no calorimetric data on this substance. The equilibrium data of Jellinek and Zakowsky<sup>1</sup> yield, for  $\text{SnS}$  (c) + H<sub>2</sub> (g) = Sn (liq.) + H<sub>2</sub>S (g),  $Q = -20.0$ ; whence, for  $\text{SnS}$  (c),  $Q_f = 22.7$ .

**$\text{Sn}(\text{SO}_4)_2$  (c).** Beck<sup>1</sup> found  $Q = 91.1$  for the heat of reaction between this substance and 8KOH (aq.). Assuming the reaction,  $\text{Sn}(\text{SO}_4)_2$  (c) + 4KOH (aq.) =  $2\text{K}_2\text{SO}_4$  (aq.) +  $\text{Sn}(\text{OH})_4$  (c), we have computed, for  $\text{Sn}(\text{SO}_4)_2$  (c),  $Q_f = 391.1$ .

**$\text{SnCl}_4 \cdot 1\frac{1}{2}\text{PH}_3$  (c).** Holtje<sup>1</sup> reported  $Q = 17.6$  for the heat of the reaction,  $\text{SnCl}_4$  (liq.) +  $1\frac{1}{2}\text{PH}_3$  (g) =  $\text{SnCl}_4 \cdot 1\frac{1}{2}\text{PH}_3$  (c).

**$\text{Sn}_n\text{Bi}_m$  (c).** From data on the heats of solution in mercury, Magnus and Mannheimer<sup>1</sup> determined the heats of formation of the solid alloys, SnBi,  $\text{SnBi}_2$ ,  $\text{Sn}_2\text{Bi}$ ,  $\text{Sn}_5\text{Bi}$ , and  $\text{SnBi}_5$ .

**$\text{SnX}_2 \cdot n\text{NH}_3$  (c).** Biltz and Fischer<sup>2</sup> measured the dissociation pressures at various temperatures for some stannous halide amines, and also determined the heats of solution of some of them in aqueous HCl. Their data are as follows:  $\text{SnCl}_2 \cdot 2\frac{1}{2}\text{NH}_3$  (c),  $S = 14.0$ ;  $\text{SnCl}_2 \cdot 4\text{NH}_3$  (c),  $D = -9.3$ ;  $\text{SnCl}_2 \cdot 9\text{NH}_3$  (c),  $D = -7.6$ ;  $\text{SnBr}_2 \cdot \text{NH}_3$  (c),  $S = 7.3$ ;  $\text{SnBr}_2 \cdot 3\text{NH}_3$  (c),  $D = -12.5$ ,  $S = 14.8$ ;  $\text{SnBr}_2 \cdot 5\text{NH}_3$  (c),  $D = -9.8$ ;  $\text{SnBr}_2 \cdot 9\text{NH}_3$  (c),  $D = -7.55$ ;  $\text{SnI}_2 \cdot \text{NH}_3$  (c),  $D = -16.0$ ;  $\text{SnI}_2 \cdot 2\text{NH}_3$  (c),  $D = -13.3$ ,  $S = 6.5$ ;  $\text{SnI}_2 \cdot 3\text{NH}_3$  (c),  $D = -11.9$ ,  $S = 14.8$ ;  $\text{SnI}_2 \cdot 5\text{NH}_3$  (c),  $D = -10.2$ ;  $\text{SnI}_2 \cdot 9\text{NH}_3$  (c),  $D = -7.9$ .

## LEAD

**Pb (c, non-radioactive).** Standard state.

**Pb (solid, "stick" form).** From data on the electromotive force of cells involving lead in both the crystalline and the "stick" form, Gerke<sup>1</sup> found for the transition from the former to the latter  $Q = -0.07$ .

**Pb (liq.).** The data on the heat of fusion of lead are: Umino,<sup>3</sup> -1.14; Iitaka,<sup>1</sup> -1.14; Robertson,<sup>2</sup> -1.34; Magnus and Oppenheimer,<sup>1</sup> -1.224; Awbery and Griffiths,<sup>1</sup> -1.295; Person,<sup>10</sup> -1.13; Mazzotto,<sup>3</sup> -....; Glaser,<sup>2</sup> -1.01; Spring,<sup>1</sup> -1.10; Klinkhardt,<sup>1</sup> -1.21.

**Pb (g).** von Wartenberg<sup>9</sup> showed that lead vapor is monatomic above 1870°. The vapor pressure data of Harteck,<sup>1</sup> von Wartenberg,<sup>7, 9</sup> Greenwood,<sup>2, 3, 5, 6</sup> Ruff and Bergdahl,<sup>1</sup> Rodebush and Dixon,<sup>1, 2</sup> Egerton,<sup>3, 4</sup> and Rodebush<sup>1</sup> yield -45 for the heat of vaporization. See also Hildebrand,<sup>2</sup> Johnson,<sup>5</sup> and van Leimpt.<sup>2</sup> From direct but rough measurements, Tate<sup>1</sup> found  $V = -37$ .

The energy states of gaseous monatomic lead are evaluated from the following: Bacher and Goudsmit,<sup>1</sup> Back,<sup>2</sup> Gieseler and Grotrian,<sup>1, 2</sup> McLennan, Young, and McLay,<sup>1</sup> Sponer,<sup>2</sup> Sur,<sup>2, 3</sup> Thorsen,<sup>1, 2</sup> Geiseler,<sup>1</sup> Rao and Narayan,<sup>4</sup> Smith,<sup>9</sup> Rao, Narayan, and Rao,<sup>1</sup> and Carroll.<sup>1</sup>

**PbCl<sub>2</sub> (c).** The electromotive force data of Gerke<sup>1</sup> on the cells in which the reactions are:  $\text{Pb (c)} + 2\text{AgCl (c)} = \text{PbCl}_2 \text{ (c)} + 2\text{Ag (c)}$  and  $\text{Pb (c)} + 2\text{HgCl (c)} = \text{PbCl}_2 \text{ (c)} + 2\text{Hg (liq.)}$ , when combined with his own data on the formation of AgCl (c) and HgCl (c), yield, for PbCl<sub>2</sub> (c),  $Q_f = 85.71$  and  $85.95$ , respectively. The data of Krahmer,<sup>1</sup> Brönsted,<sup>1</sup> Gunther,<sup>1</sup> Wolff,<sup>2</sup> and Getman<sup>2</sup> are in accord with the lower of these values.

**PbCl<sub>2</sub> (aq.).** The data on the heat of solution of lead chloride in water are: Thomsen,<sup>15</sup> -3.44; Berthelot,<sup>9</sup> -4.0; Bronsted,<sup>4</sup> -3.28.

**PbCl<sub>2</sub> (liq.).** The data on the heat of fusion of lead chloride are: Ehrhardt,<sup>1</sup> -5.8; Weber,<sup>1</sup> -5.61; Rudberg,<sup>1</sup> -5.81; Goodwin and Kalmus,<sup>1</sup> -5.15.

**PbCl<sub>2</sub> (g).** The vapor pressure data of von Wartenberg and Bosse,<sup>1</sup> Jellinek and Rudat,<sup>2</sup> Jellinek and Golubowski,<sup>1</sup> Eastman and Duschak,<sup>1</sup> and Maier<sup>6</sup> yield -28.5 for the heat of vaporization of the liquid at 860°.

**PbO (c, red).** For the heat of the reaction,  $\text{PbO (c, red)} + \text{H}_2 \text{ (g)} = \text{Pb (c)} + \text{H}_2\text{O (liq.)}$ , the data of Smith and Wood<sup>1</sup> give 15.91, and those of Fried<sup>1</sup> give 16.6. These values yield, for PbO (c),  $Q_f = 52.46$  and  $51.8$  respectively. From electromotive force measurements Treadwell<sup>1</sup> computed the heat of formation to be 50.4 at high temperatures. Combination of Thomsen's<sup>15</sup> data on the two reactions,  $\text{PbO (c)} + 2\text{HNO}_3(200) = \text{Pb(NO}_3)_2(400) + \text{H}_2\text{O (liq.)}$  and  $\text{Pb(NO}_3)_2(400) + 2\text{KCl}(200) = 2\text{KNO}_3(400) + \text{PbCl}_2 \text{ (c)}$ , yield for the reaction,  $\text{PbO (c)} + 2\text{HNO}_3(200) + 2\text{KCl}(200) = 2\text{KNO}_3(400) + \text{H}_2\text{O (liq.)} + \text{PbCl}_2 \text{ (c)}$ ,  $Q = 22.22$ . From this we have computed, for PbO (c),  $Q_f = 52.91$ . Marshall and Bruz<sup>1</sup> measured the heat of solution of PbO in 10 per cent aqueous nitric acid to be 19.8.

**Pb(NO<sub>3</sub>)<sub>2</sub> (aq.).** Thomsen<sup>15</sup> measured the heat of the reaction,  $\text{PbO (c)} + 2 \text{HNO}_3(200) = \text{Pb(NO}_3)_2(400) + \text{H}_2\text{O (liq.)}$ , and his data yield  $Q = 17.76$ , whence, for Pb(NO<sub>3</sub>)<sub>2</sub>(400),  $Q_f = 100.05$ . It is probable that Thomsen used the yellow form of PbO, in which case the value for aqueous lead nitrate would be a little less than that given above. For the reaction,  $\text{Pb(NO}_3)_2(400) + 2 \text{KCl}(200) = \text{PbCl}_2 \text{ (c)} + 2 \text{KNO}_3(400)$ , Thomsen<sup>15</sup> reported  $Q = 4.46$ , from which we have computed, for Pb(NO<sub>3</sub>)<sub>2</sub>(400),  $Q_f = 100.50$ . For the similar reaction with aqueous KI, Thomsen<sup>15</sup>

reported  $Q = 13.79$ . This yields, for  $\text{Pb}(\text{NO}_3)_2(400)$ ,  $Q_f = 99.80$ . Thomsen<sup>15</sup> measured the heat of dilution of aqueous lead nitrate.

**$\text{Pb}(\text{NO}_3)_2$  (c).** The data on the heat of solution of lead nitrate are: Thomsen,<sup>15</sup>  $-7.61_{400}$ ; Favre and Silbermann,<sup>3</sup>  $-7.93$ ; Tammann and Krings,<sup>1</sup>  $-8.49$ . See also Berthelot.<sup>10</sup>

**$\text{PbSO}_4$  (c, II).** Thomsen<sup>15</sup> measured the heats of the reactions,  $\text{Pb}(\text{NO}_3)_2(400) + \text{H}_2\text{SO}_4(400) = \text{PbSO}_4(\text{c}) + 2\text{HNO}_3(400)$ ,  $\text{Pb}(\text{C}_2\text{H}_3\text{O}_2)_2(400) + \text{H}_2\text{SO}_4(400) = \text{PbSO}_4(\text{c}) + 2\text{HC}_2\text{H}_3\text{O}_2(400)$ , and  $\text{Pb}(\text{NO}_3)_2(400) + \text{Na}_2\text{SO}_4(400) = \text{PbSO}_4(\text{c}) + 2\text{NaNO}_3(400)$ . His data yield  $Q = 5.40$ ,  $7.58$ , and  $1.70$ , respectively; whence, for  $\text{PbSO}_4(\text{c})$ , we have computed  $Q_f = 218.30$ ,  $218.80$ , and  $218.36$ . From electromotive force measurements, Klein<sup>1</sup> computed  $Q = -2.48$  for the reaction,  $\text{PbCl}_2(\text{c}) + \text{K}_2\text{SO}_4(100) = \text{PbSO}_4(\text{c}) + 2\text{KCl}(50)$ , whence, for  $\text{PbSO}_4(\text{c})$ ,  $Q_f = 219.99$ . Combination of the electromotive force data of Henderson and Stegeman<sup>1</sup> with those of Gerke<sup>1</sup> yield, for  $\text{Pb}(\text{c}) + \text{Hg}_2\text{SO}_4(\text{c}) = \text{PbSO}_4(\text{c}) + \text{Hg}(\text{liq.})$ ,  $Q = 42.17$ ; whence, for  $\text{PbSO}_4(\text{c})$ ,  $Q_f = 217.8$ . See also Ishikawa.<sup>4</sup>

**$\text{PbSO}_4$  (c, I).** Hare<sup>1</sup> measured the heat of transition.

**$\text{PbO}_2$  (c).** Tscheltzow<sup>1</sup> measured the heats of the reactions,  $\text{PbO}_2(\text{c}) + \text{SO}_2(\text{g}) = \text{PbSO}_4(\text{c})$  and  $\text{PbO}_2(\text{c}) + (2\text{HgNO}_3 + 4\text{HNO}_3)(\text{aq.}) = \text{Pb}(\text{NO}_3)_2 + \text{Hg}(\text{NO}_3)_2(\text{aq.}) + 2\text{H}_2\text{O}(\text{liq.})$ , and his data yield  $Q = 82.62$  and  $31.85$ , respectively; whence, for  $\text{PbO}_2(\text{c})$ ,  $Q_f = 64.9$  and  $63.2$ . Vosburgh and Craig<sup>1</sup> measured the electromotive force at various temperatures of the cell in which the reaction is  $\text{PbO}_2(\text{c}) + 2\text{Hg}(\text{liq.}) + 2\text{H}_2\text{SO}_4(50) = \text{Hg}_2\text{SO}_4(\text{c}) + \text{PbSO}_4(\text{c}) + 2\text{H}_2\text{O}(\text{liq.})$ , and computed  $Q = 44.73$  at  $25^\circ$ . This gives, for  $\text{PbO}_2(\text{c})$ ,  $Q_f = 64.18$ . Millar<sup>5</sup> computed the entropy of  $\text{PbO}_2(\text{c})$  from his data on heat capacities at low temperatures, and utilizing the equilibrium data of Glasstone and Westcott<sup>1</sup> on the reactions,  $\text{PbO}_2(\text{c}) + \text{H}_2(\text{g}) = \text{PbO}(\text{c}) + \text{H}_2\text{O}(\text{liq.})$  and  $\text{PbCl}_2(\text{c}) + \text{Cl}_2(\text{g}) + 2\text{H}_2\text{O}(\text{liq.}) = \text{PbO}_2(\text{c}) + 4\text{HCl}(\text{g})$ , computed, for  $\text{PbO}_2(\text{c})$ ,  $Q_f = 65.96$ . Mixer<sup>8</sup> measured the heats of the reactions,  $\text{Pb}(\text{c}) + 2\text{Na}_2\text{O}_2(\text{c}) = \text{Na}_2\text{PbO}_3(\text{c}) + \text{Na}_2\text{O}(\text{c})$  and  $\text{PbO}_2(\text{c}) + \text{Na}_2\text{O}(\text{c}) = \text{Na}_2\text{PbO}_3(\text{c})$ , finding  $Q = 63.6$  and  $38.44$ , respectively. The difference gives, for  $\text{Pb}(\text{c}) + 2\text{Na}_2\text{O}_2(\text{c}) = \text{PbO}_2(\text{c}) + 2\text{Na}_2\text{O}(\text{c})$ ,  $Q = 25.16$ ; whence, for  $\text{PbO}_2(\text{c})$ ,  $Q_f = 64.7$ . There is an old value for the heat of formation of lead peroxide obtained by Hess.<sup>7</sup>

**$\text{Pb}_3\text{O}_4$  (c).** The equilibrium,  $2\text{Pb}_3\text{O}_4(\text{c}) = 6\text{PbO}(\text{c}) + \text{O}_2(\text{g})$ , was studied by LeChatelier<sup>2</sup> and by Reinders and Hamburger.<sup>1</sup> From the data of the former, Biltz<sup>8</sup> deduced  $Q = -32.2$ , while the latter gave  $Q = -33.5$ . These values yield, for  $\text{Pb}_3\text{O}_4(\text{c})$ ,  $Q_f = 173.5$  and  $174.1$ , respectively. For the heat of the reaction,  $3\text{PbO}_2(\text{c}) = \text{Pb}_3\text{O}_4(\text{c}) + \text{O}_2(\text{g})$ , Debray<sup>2</sup> gave  $-23.8$ , which yields, for  $\text{Pb}_3\text{O}_4(\text{c})$ ,  $Q_f = 171.2$ . See also Henglein.<sup>1</sup> From his own data on the heat capacity down to low temperatures, and from the electromotive force data of Glasstone,<sup>1</sup> Millar<sup>5</sup> computed, for  $\text{Pb}_3\text{O}_4(\text{c})$ ,  $Q_f = 172.4$ .

**$\text{Pb}_2\text{O}$  (c).** For the heats of solution of  $\text{Pb}_2\text{O}(\text{c})$  and  $\text{PbO}(\text{c})$  in aqueous acetic acid, Herschkowitsch<sup>1</sup> found  $16.71$  and  $15.50$ , while

Aufenast and Terry<sup>1</sup> found 15.26 and 15.6, respectively. These data yield, for  $\text{Pb}_2\text{O}$  (c),  $Q_f = 51.3$  and  $52.8$ , respectively.

**$\text{Pb}(\text{OH})_2$  (c).** The heat of neutralization of  $\text{Pb}(\text{OH})_2$  (c) with aqueous nitric acid was measured by Berthelot,<sup>5</sup> Sveda,<sup>1</sup> Herschkowitsch,<sup>1</sup> Tanatar,<sup>6</sup> and Aufenast and Terry.<sup>1</sup> Their data yield, for  $\text{Pb}(\text{OH})_2$  (c),  $Q_f = 122.7$ .

**$\text{PbF}_2$  (c).** Guntz<sup>1</sup> found 2.2 for the heat of reaction of aqueous lead nitrate with aqueous hydrofluoric acid. This gives for  $\text{PbF}_2$  (c),  $Q_f = 159.5$ . From equilibrium data, Jellinek and Rudat<sup>1</sup> calculated  $Q_f = 156$ .

**$\text{PbF}_2$  (g).** The vapor pressure data of von Wartenberg and Bosse<sup>1</sup> yield  $-39.4$  for the heat of sublimation at  $1200^\circ$ .

**$\text{PbCl}_2 \cdot n\text{PbO}$  (c).** Andre<sup>1</sup> measured the heats of solution in aqueous  $\text{HCl}$  of  $\text{PbCl}_2 \cdot \text{PbO}$  (c),  $\text{PbCl}_2 \cdot 2\text{PbO}$  (c), and  $\text{PbCl}_2 \cdot 3\text{PbO}$  (c). The last named substance may probably be just a mixture, not a true compound.

**$\text{PbBr}_2$  (c).** Thomsen<sup>15</sup> found  $Q = 8.02$  for the reaction,  $\text{Pb}(\text{NO}_3)_2(200) + 2\text{KBr}(100) = 2\text{KNO}_3(200) + \text{PbBr}_2$  (c), whence, for  $\text{PbBr}_2$  (c),  $Q_f = 66.58$ . Krahmer<sup>1</sup> gave  $Q = -17.96$  for the reaction,  $\text{Pb}$  (c)  $+ 2\text{AgBr}$  (c)  $= 2\text{Ag}$  (c)  $+ \text{PbBr}_2$  (c); whence, for  $\text{PbBr}_2$  (c),  $Q_f = 64.58$ . Klein<sup>1</sup> reported  $Q = 3.56$  for the reaction,  $\text{PbCl}_2$  (c)  $+ 2\text{KBr}$  (aq.)  $= \text{PbBr}_2$  (c)  $+ 2\text{KCl}$  (aq.); whence, for  $\text{PbBr}_2$  (c),  $Q_f = 67.6$ . Equilibrium data involving lead bromide were reported by Jellinek and Rudat<sup>1</sup> and Lorenz and Schultz.<sup>1</sup>

**$\text{PbBr}_2$  (aq.).** Thomsen<sup>15</sup> measured the heat of solution of lead bromide.

**$\text{PbBr}_2$  (liq.).** The data on the heat of fusion are: Weber,<sup>1</sup>  $-5.01$ ; Goodwin and Kalmus,<sup>1</sup>  $-4.52$ . See also Erhardt<sup>1</sup> and Czepinsky.<sup>1</sup>

**$\text{PbBr}_2$  (g).** The vapor pressure data of von Wartenberg and Bosse<sup>1</sup> yield  $-28$  for the heat of vaporization at  $916^\circ$ .

**$\text{PbBr}_2 \cdot n\text{PbO}$  (c).** Andre<sup>1</sup> measured the heats of solution in aqueous  $\text{HBr}$  of  $\text{PbBr}_2 \cdot \text{PbO}$  (c),  $\text{PbBr}_2 \cdot 2\text{PbO}$  (c), and  $\text{PbBr}_2 \cdot 3\text{PbO}$  (c).

**$\text{PbI}_2$  (c).** The data of Gerke<sup>1</sup> on the cell reaction,  $\text{Pb}$  (c)  $+ \text{I}_2$  (c)  $= \text{PbI}_2$  (c), yield, for  $\text{PbI}_2$  (c),  $Q_f = 41.77$ . See also Braune and Koref,<sup>1</sup> who reported  $Q_f = 41.6$ .

**$\text{PbI}_2$  (liq.).** For the heat of fusion of lead iodide, Ehrhardt<sup>1</sup> found  $-5.28$  at  $375^\circ$  and Czepinski<sup>2</sup>  $-5.28$ .

**$\text{PbI}_2$  (g).** The vapor pressure data of Jellinek and Rudat<sup>1</sup> yield  $-27.7$  for the heat of vaporization at  $800^\circ$ .

**$\text{PbI}_2 \cdot \text{HI} \cdot 5\text{H}_2\text{O}$  (c).** Berthelot<sup>69</sup> measured the heat of solution of this substance.

**$\text{PbS}$  (c).** Berthelot<sup>14</sup> found the heats of reaction of aqueous hydrogen sulfide to be 13.34 and 11.34 with aqueous lead nitrate and aqueous lead acetate, respectively; whence, for  $\text{PbS}$  (c),  $Q_f = 24.8$  and  $20.6$ , respectively. Thomsen<sup>15</sup> found  $Q = 30.98$  for the reaction between aqueous lead nitrate and aqueous sodium sulfide; whence, for  $\text{PbS}$  (c),  $Q_f = 22.5$ . From equilibrium data, Jellinek and Zakowski<sup>1</sup> deduced  $Q_f = 20.0$ ; Watanabe<sup>2</sup> obtained 22.85; Jellinek and Deubel,<sup>1</sup> 26.2.

**PbSO<sub>4</sub> · nPbO (c).** There has been a long polemic concerning the nature of the successive reactions occurring in the roasting of lead sulfate with lead sulfide, between Reinders<sup>1, 2, 3, 4</sup> on the one hand and Schenck and coworkers (Schenck and Rassback,<sup>1, 2</sup> Schenck and Borkenstein,<sup>1</sup> Schenck and Albers<sup>1</sup>) on the other. See also Hofmann and Wanjukow.<sup>1</sup> According to Schenck and coworkers, the reactants for the various equilibrium curves are: PbSO<sub>4</sub> + PbS; PbSO<sub>4</sub> · PbO + PbS; PbSO<sub>4</sub> · 2 PbO + PbS; PbSO<sub>4</sub> · 3 PbO + PbS; PbO + PbS. This interpretation leads to the following values for the heats of formation: PbSO<sub>4</sub> · PbO (c), 280; PbSO<sub>4</sub> · 2 PbO (c), 340; PbSO<sub>4</sub> · 3 PbO (c), 398; PbO (c), 57. According to Reinders the reactants are: PbSO<sub>4</sub> + PbS; PbSO<sub>4</sub> · PbO + Pb; PbSO<sub>4</sub> · 2 PbO + Pb; PbSO<sub>4</sub> · 3 PbO + Pb; PbO + PbS. This interpretation yields the following values for *Qf*: PbSO<sub>4</sub> · PbO (c), 280; PbSO<sub>4</sub> · 2 PbO (c), 338; PbSO<sub>4</sub> · 3 PbO (c), 369; PbO (c), 51. In spite of the high value for PbO, we have accepted Schenck's as the more logical explanation of the equilibrium data obtained.

**PbSO<sub>4</sub> · 2 HCl (c).** Ephraim<sup>7</sup> studied the dissociation pressure of this substance.

**PbS<sub>2</sub>O<sub>3</sub> (c).** Fogh<sup>1</sup> found *Q* = 5.80 for the reaction between aqueous lead acetate and aqueous sodium thiosulfate to form an insoluble white product which was presumably lead thiosulfate. Hence, for PbS<sub>2</sub>O<sub>3</sub> (c), *Qf* = 151.1.

**PbS<sub>3</sub>O<sub>6</sub> (c).** Fogh<sup>1</sup> measured the heat of solution.

**PbS<sub>2</sub>O<sub>6</sub> · 4 H<sub>2</sub>O (c).** Thomsen<sup>15</sup> measured the heat of solution.

**PbSe (c).** Fabre<sup>1</sup> found *Q* = 40.1 for the reaction of aqueous lead acetate with gaseous hydrogen selenide; whence, for PbSe (c), *Qf* = 21.2. For the heat of solution of crystalline lead selenide in saturated bromine water to form lead selenate Fabre<sup>1</sup> found 92.1; whence, for PbSe (c), *Qf* = 10.

**PbSeO<sub>4</sub> (c).** Metzner<sup>2</sup> found *Q* = 0.62 for the reaction of aqueous lead nitrate with aqueous sodium selenate; whence, for PbSeO<sub>4</sub> (c), *Qf* = 148.6.

**PbTe (c).** Fabre<sup>3</sup> found 104.5 for the heat of solution of solid lead telluride in saturated bromine water. These data yield, for PbTe (c), *Qf* = 19.1 or 6.0, depending upon whether tellurate or tellurite was formed. Fabre<sup>3</sup> said that the product was tellurite, but in another experiment he found that tellurium dissolved under the same conditions to form tellurate.

**PbN<sub>6</sub> (c).** Wohler and Martin<sup>1</sup> measured the heat of decomposition by explosion into solid lead and gaseous nitrogen to be 103.0.

**Pb(NO<sub>3</sub>)<sub>2</sub> · PbO (c).** Thomsen's<sup>15</sup> data on the reaction between aqueous lead nitrate and aqueous sodium hydroxide yield, for Pb(NO<sub>3</sub>)<sub>2</sub> · PbO (c), *Qf* = 167.6.

**PbX<sub>2</sub> · nNH<sub>3</sub> (c).** Biltz and Fischer<sup>1</sup> measured at various temperatures the dissociation pressures of the ammines of PbCl<sub>2</sub> with 1, 1½, 2, 3½, and 8 moles of NH<sub>3</sub>, of PbBr<sub>2</sub> with 1, 2, 3, 5½, and 8 moles of NH<sub>3</sub>, and of PbI<sub>2</sub> with ½, 1, 2, 5, and 8 moles of NH<sub>3</sub>. See also Ephraim.<sup>10</sup>

$2 \text{PbCl}_2 \cdot \text{NH}_4\text{Cl}$  (c). Brönsted<sup>8</sup> determined, from electromotive force measurements, the heat of formation of this substance from solid lead chloride and solid ammonium chloride to be 0.35.

$3 \text{PbI}_2 \cdot 4 \text{NH}_4\text{I} \cdot n\text{H}_2\text{O}$  (c). Mosnier<sup>1</sup> measured the heat of solution of the anhydrous salt and the hexadecahydrate.

$\text{PbSO}_4 \cdot (\text{NH}_4)_2 \text{SO}_4$  (c). Barre<sup>1</sup> found  $Q=1.93$  for the heat of formation of this substance from solid lead sulfate and solid ammonium sulfate.

$\text{PbHPO}_3$  (c). Amat<sup>1</sup> found  $Q=0.65$  for the heat of mixing  $\text{Na}_2\text{HPO}_3$  (aq.) with  $\text{Pb}(\text{NO}_3)_2$  (aq.).

$\text{SnI}_2 \cdot \text{PbI}_2 \cdot n\text{H}_2\text{O}$  (c). Mosnier<sup>1</sup> measured the heats of solution of the anhydrous salt and the octahydrate.

$3 \text{PbI}_2 \cdot \text{SbI}_3 \cdot n\text{H}_2\text{O}$  (c). Mosnier<sup>1</sup> measured the heats of solution of the anhydrous salt and the dodecahydrate.

$3 \text{PbI}_2 \cdot \text{PI}_3 \cdot n\text{H}_2\text{O}$  (c). Mosnier<sup>1</sup> measured the heats of solution of the anhydrous salt and the dodecahydrate.

$3 \text{PbI}_2 \cdot \text{AsI}_3 \cdot n\text{H}_2\text{O}$  (c). Mosnier<sup>1</sup> measured the heats of solution of the anhydrous salt and the dodecahydrate.

$3 \text{PbI}_2 \cdot \text{BiI}_3 \cdot n\text{H}_2\text{O}$  (c). Mosnier<sup>1</sup> measured the heats of solution of the anhydrous salt and the dodecahydrate.

$\text{PbCO}_3$  (c). Thomsen<sup>15</sup> found 6.11 for the heat of the reaction,  $\text{Pb}(\text{NO}_3)_2(200) + \text{Na}_2\text{CO}_3(200) = \text{PbCO}_3(\text{c}) + 2 \text{NaNO}_3(200)$ ; whence, for  $\text{PbCO}_3(\text{c})$ ,  $Q_f=169.8$ . Berthelot<sup>12</sup> found 5.04 and 5.72 for the above reaction with sodium and potassium carbonates respectively. Berthelot<sup>12</sup> believed the reaction took place in two steps: the formation of amorphous lead carbonate and then its crystallization. He deduced 4.2 for the heat of crystallization. Marshall and Bruzs<sup>1</sup> measured the heat of solution of  $\text{PbCO}_3(\text{c})$  in 10 per cent aqueous nitric acid to be 1.69, whence for  $\text{PbCO}_3(\text{c})$ ,  $Q_f=168.0$ .

$\text{PbCO}_3 \cdot n\text{PbO}$  (c). Marshall and Bruzs<sup>1</sup> measured the heat of solution in 10 per cent aqueous nitric acid of  $\text{PbCO}_3 \cdot \text{PbO}(\text{c})$  to be 8.69. From equilibrium data, Centnerswer, Falk, and Awerbuch<sup>1</sup> calculated: for  $3 \text{PbO}(\text{c}) + \text{CO}_2(\text{g}) = \text{PbCO}_3 \cdot 2 \text{PbO}(\text{c})$ ,  $Q=25$ ; for  $\text{PbCO}_3 \cdot \text{PbO}(\text{c}) + \text{CO}_2(\text{g}) = 2 \text{PbCO}_3(\text{c})$ ,  $Q=-19.8$ ; and for  $2 (\text{PbCO}_3 \cdot 2 \text{PbO})(\text{c}) + \text{CO}_2(\text{g}) = 3 (\text{PbCO}_3 \cdot \text{PbO})(\text{c})$ ,  $Q=23$ .

$\text{PbC}_2\text{O}_4$  (c). Berthelot<sup>12</sup> measured the heat of reaction between aqueous lead nitrate and aqueous potassium oxalate to be 9.3.

$\text{Pb}(\text{C}_2\text{H}_3\text{O}_2)_2$  (aq.). The data of Thomsen<sup>15</sup> yield for the reactions,  $\text{Zn}(\text{c}) + \text{Pb}(\text{C}_2\text{H}_3\text{O}_2)_2(400) = \text{Zn}(\text{C}_2\text{H}_3\text{O}_2)_2(400) + \text{Pb}(\text{c})$ , and  $\text{PbO}(\text{c}) + 2 \text{HC}_2\text{H}_3\text{O}_2(200) = \text{Pb}(\text{C}_2\text{H}_3\text{O}_2)_2(400) + \text{H}_2\text{O}(\text{liq.})$ ,  $Q=34.90$  and  $15.46$ , respectively. From the known values for the other substances we have obtained, for  $\text{Pb}(\text{C}_2\text{H}_3\text{O}_2)_2(400)$ ,  $Q_f=236.0$  and  $235.6$ , respectively. The data of Herschkowitsch<sup>1</sup> and Aufenast and Terry<sup>1</sup> yield for the second reaction above  $Q=15.50$  and  $15.6$ , respectively; whence, for  $\text{Pb}(\text{C}_2\text{H}_3\text{O}_2)_2(\text{aq.})$ ,  $Q_f=235.7$  and  $235.8$ .

$\text{Pb}(\text{C}_2\text{H}_3\text{O}_2)_2$  (c). Berthelot<sup>9</sup> measured the heat of solution.

**Pb(C<sub>2</sub>H<sub>3</sub>O<sub>2</sub>)<sub>2</sub> · 3 H<sub>2</sub>O (c).** The data on the heat of solution are: Berthelot,<sup>9</sup>  $-5.5_{220}^{11}$ ; Favre and Silbermann,<sup>3</sup>  $-4.9$ ; Thomsen,<sup>15</sup>  $-6.14_{200}$ .

**Pb(C<sub>2</sub>H<sub>3</sub>O<sub>2</sub>)<sub>2</sub> · PbO (c).** Thomsen's<sup>15</sup> data yield, for this substance,  $Q_f = 292.9$ .

**Pb(CHO<sub>2</sub>)<sub>2</sub> (aq.).** Berthelot<sup>9</sup> found 13.2 for the heat of neutralization of solid lead hydroxide with aqueous formic acid.

**Pb(CHO<sub>2</sub>)<sub>2</sub> (c).** Berthelot<sup>9</sup> measured the heat of solution of lead formate.

**Pb(C<sub>2</sub>H<sub>3</sub>O<sub>3</sub>)<sub>2</sub> (aq.).** de Forcrand<sup>3</sup> measured the heat of reaction of aqueous lead glycolate with aqueous hydrogen sulfide to be 11.5.

**Pb(C<sub>2</sub>H<sub>3</sub>O<sub>3</sub>)<sub>2</sub> (c).** deForcrand<sup>3</sup> measured the heat of solution of lead glycolate.

**Pb(CN)<sub>2</sub> · 2 PbO · H<sub>2</sub>O (c).** Joannis<sup>1</sup> measured the heat of solution of this substance in aqueous nitric acid to be 36.8.<sup>19</sup>

**Pb(CNS)<sub>2</sub> (c).** Joannis<sup>1</sup> measured the heat of mixing aqueous lead acetate with aqueous potassium sulfocyanide to be 7.4.

**PbSn (c).** Magnus and Mannheimer<sup>1</sup> found the heat of formation of PbSn (c) to be 0.03 by measuring the heats of solution in mercury.

**PbSn<sub>n</sub> (liq.).** Magnus and Mannheimer<sup>1</sup> measured the heat of mixing the two liquid metals.

**PbSb<sub>n</sub> (liq.).** Guthrie and Libmans<sup>1</sup> discussed the data of Wust and Durrer<sup>1</sup> on the heat of mixing the liquid metals. See also Dobereiner<sup>1</sup> and Taylor.<sup>3</sup>

## GALLIUM

**Ga (c).** Standard state.

**Ga (g).** We have estimated the heat of sublimation to be  $-52$ . The somewhat uncertain vapor pressure data of Harteck<sup>2</sup> yield  $-50.9^{00}$ . The values for the various energy states of gaseous monatomic gallium are from the following: first spectra, Uhler and Tanch,<sup>1</sup> Paschen and Meissner<sup>1</sup>; second spectra, Sawyer and Lang,<sup>1</sup> Lang,<sup>1</sup> and Rao, Narayan, and Rao<sup>1</sup>; third spectra, Lang<sup>1</sup>; fourth spectra, Mack, LaPorte and Lang.<sup>1</sup>

**GaCl<sub>3</sub> (aq.).** Schwarz von Bergkampff<sup>1</sup> measured the heat of solution of Ga (c) in HCl (9) to be 32. We have estimated the value for the dilute solution.

**Ga<sub>2</sub>O<sub>3</sub> (c).** Roth and Becker<sup>3</sup> determined the heat of formation of this oxide by combustion of gallium in oxygen to be 255.8.

**Ga<sup>+++</sup> (aq.).** This value is obtained from that for aqueous gallium chloride.

## INDIUM

**In (c).** Standard state.

**In (g).** We have estimated the heat of sublimation. The values for the energy states of gaseous monatomic indium are from the following: first spectra, Paschen and Meissner,<sup>1</sup> Uhler and Tanch<sup>1</sup>; second spectra, Lang and Sawyer<sup>1</sup>; third spectra, Rao, Narayan, and Nao.<sup>1</sup> See also Bacher and Goudsmit.<sup>1</sup>

**In<sub>2</sub>O<sub>3</sub> (c).** Ditte<sup>6</sup> measured the heat of combustion of indium.

**InCl<sub>3</sub> (aq.).** Klemm and Brautigam<sup>1</sup> measured the heat of reaction of In (c) with Cl<sub>2</sub> (aq.).

**In<sup>+++</sup> (aq.).** The value for this substance is obtained from those for InCl<sub>3</sub> (aq.) and Cl<sup>-</sup> (aq.).

**InBr<sub>3</sub> (aq.), InI<sub>3</sub> (aq.).** The values for these substances are obtained from those for the ions.

**InCl (c), InCl<sub>2</sub> (c).** Klemm and Brautigam<sup>1</sup> measured the heats of reaction of these substances, respectively, with aqueous chlorine to form aqueous InCl<sub>3</sub>.

**InCl<sub>3</sub> (c), InBr<sub>3</sub> (c), InI<sub>3</sub> (c).** Klemm<sup>1</sup> measured the heats of solution of these substances in HCl (21).

**InX<sub>3</sub> · nNH<sub>3</sub> (c).** Klemm<sup>1</sup> measured the heats of solution in HCl (22) of the following: NH<sub>3</sub> (g), 12.3; InCl<sub>3</sub> · NH<sub>3</sub> (c), 15.4; InCl<sub>3</sub> · 2 NH<sub>3</sub> (c), 15.8; InCl<sub>3</sub> · 3 NH<sub>3</sub> (c), 16.8; InCl<sub>3</sub> · 5 NH<sub>3</sub> (c), 34.4; InBr<sub>3</sub> · 3 NH<sub>3</sub> (c), 17.3; InBr<sub>3</sub> · 5 NH<sub>3</sub> (c), 30.8; InBr<sub>3</sub> · 7 NH<sub>3</sub> (c), 54.6; InI<sub>3</sub> · 2 NH<sub>3</sub> (c), 14.0; InI<sub>3</sub> · 5 NH<sub>3</sub> (c), 27.7; InI<sub>3</sub> · 7 NH<sub>3</sub> (c), 46.4. Klemm<sup>1</sup> also determined from dissociation pressure data the heats of dissociation of the following: InCl<sub>3</sub> with 1, 2, 3, 5, 7, and 15 moles of NH<sub>3</sub>; InBr<sub>3</sub> with 5, 6, and 15 moles of NH<sub>3</sub>; InI<sub>3</sub> with 1, 9, and 15 moles of NH<sub>3</sub>.

## THALLIUM

**Tl (c, II).** Standard state.

**Tl (c, I).** The heat of transition at 226° was determined by Bridgman,<sup>7, 8</sup> Werner,<sup>2</sup> and Umino.<sup>1</sup>

**Tl (liq.).** The data on the heat of fusion of thallium yield the following values: Heycock and Nevilles,<sup>1</sup> -1.05; Robertson,<sup>1</sup> -1.47; Richards and Smyth,<sup>1</sup> -1.52; Lewis and Randall,<sup>4</sup> -1.45; Roos,<sup>1</sup> -1.52. See also Umino.<sup>1</sup>

**Tl (g).** We have assumed that gaseous thallium is monatomic. Vapor pressure data were reported by Gibson,<sup>1</sup> Krafte and Knocke,<sup>1</sup> von Wartenberg,<sup>9</sup> and Fischer and Geiger<sup>1</sup> (see Sherman<sup>1</sup>). These data yield values for the heat of sublimation ranging from -28 to -45. Butkow<sup>1</sup> and Butkow and Terenin<sup>1</sup> reported -81 for the heat of reaction TlII (g) = Tl (g) + I\* (g); whence, for Tl (g),  $Q_f = -35.9$ . Similar data on TlCl (g) and TlBr (g) yield, for Tl (g),  $Q_f = -41.9$  and  $-37.5$ , respectively. The values of Mayer<sup>2</sup> for the lattice energies of TlCl, TlBr, and TlI yield, for Tl (g),  $Q_f = -38.6$ ,  $-43.4$ , and  $-40.2$ .

The values for the energy states of gaseous monatomic thallium are from Fowler,<sup>3</sup> McLennan, McLay, and Crawford,<sup>1</sup> Carroll,<sup>1</sup> and Smith.<sup>8</sup>

**Tl<sub>2</sub>SO<sub>4</sub> (aq.).** Thomsen<sup>15</sup> measured the heats of solution of Tl (c, II) and of Tl<sub>2</sub>SO<sub>4</sub> (c) in H<sub>2</sub>SO<sub>4</sub> (50), and of Tl<sub>2</sub>SO<sub>4</sub> (c) in water. His data yield for Tl<sub>2</sub>SO<sub>4</sub> (1600),  $Q_f = 213.7$ . Data on the heat of dilution of aqueous thallous sulfate were reported by Thomsen<sup>15</sup> and deForcrand.<sup>71</sup>

**Tl<sub>2</sub>SO<sub>4</sub> (c).** The data on the heat of solution in water are: Cohen and Kooy,<sup>1</sup>  $-7.94_{3200}^{20}$ ; Thomsen,<sup>15</sup>  $-8.28_{1600}$ . See also Ishikawa.<sup>1, 2</sup>

**TlOH (aq.).** Thomsen<sup>15</sup> measured the heat of neutralization of 2 TlOH(200) with H<sub>2</sub>SO<sub>4</sub>(400) to be 31.12<sub>800</sub>. See also deForcrand.<sup>71</sup>

**Tl<sub>2</sub>O<sub>3</sub> (c).** From equilibrium studies, Duncan<sup>2</sup> computed  $Q^{1000} = -77$  for the reaction Tl<sub>2</sub>O<sub>3</sub> (liq.) = Tl<sub>2</sub>O (liq.) + O<sub>2</sub> (g). From these data we have estimated, for Tl<sub>2</sub>O<sub>3</sub> (c),  $Q_f = 120$ . See also Roth and Becker.<sup>3</sup>

**TlOH (c).** Thomsen<sup>15</sup> found  $S = -3.15$ . See also Aufenast and Terrey.<sup>1</sup>

**Tl<sub>2</sub>O (c).** Thomsen<sup>15</sup> found  $S = -3.08$ , whence, for Tl<sub>2</sub>O (c),  $Q_f = 42.3$ . From equilibrium data, Bahr<sup>1</sup> computed  $Q = -14.1$  for the reaction, 2 TlOH (c) = Tl<sub>2</sub>O (c) + H<sub>2</sub>O (g); whence, for Tl<sub>2</sub>O (c),  $Q_f = 42.0$ .

**TlCl (c).** The accurate electromotive force data of Gerke<sup>1</sup> yield for, TlCl (c),  $Q_f = 48.62$ . Combination of the data of Thomsen<sup>15</sup> on the heat of neutralization of TlOH (aq.) with HCl (aq.) and the heat of solution of TlCl (c), yields, for the latter,  $Q_f = 48.95$ . See also Blaszkewska.<sup>1</sup>

**TlCl (aq.).** The data on the heat of solution of TlCl (c) are: Thomsen,<sup>15</sup>  $-10.0$ ; Butler and Hiscock,<sup>1</sup>  $-10.56$ .

**TlCl (liq.).** Roos<sup>1</sup> reported  $-3.95^{430}$  for the heat of fusion.

**TlCl (g).** The vapor pressure data of von Wartenberg and Bosse<sup>1</sup> yield  $-25.2^{806}$  for the heat of vaporization; whence, for TlCl (g),  $Q_f = 16.4$ .

**TlF (aq.).** de Forcrand<sup>69</sup> measured the heats of solution of Tl<sub>2</sub>O (c) and TlOH (c) in HF(600) to be 28.33<sup>13</sup> and 25.21<sup>13</sup>, respectively. Petersen<sup>1</sup> measured the heat of neutralization of TlOH(400) with HF(400) to be 16.44. These data yield, for TlF(800),  $Q_f = 76.8$  and 77.5, respectively. If excess HF (aq.) was present in de Forcrand's experiments, the value from his data should be increased by 0.58.

**TlF (c).** There are no data on the heat of solution of thallous fluoride.

**TlF (g).** The vapor pressure data of von Wartenberg and Bosse<sup>1</sup> yield  $-25.1^{298}$  for the heat of vaporization.

**TlBr (c).** Thomsen<sup>15</sup> measured the heat of reaction of Tl<sub>2</sub>SO<sub>4</sub> (aq.) with KBr (aq.), his data yielding, for TlBr (c),  $Q_f = 41.48$ .

**TlBr (liq.).** Roos<sup>1</sup> reported  $F = -3.6^{456}$ . See also Mellor.<sup>1</sup>

**TlBr (g).** The vapor pressure data of von Wartenberg<sup>1</sup> yield  $-25.2^{817}$  for the heat of vaporization, whence, for TlBr (g),  $Q_f = 9.5$ .

**TlI (c).** Thomsen's<sup>15</sup> data on the reaction of Tl<sub>2</sub>SO<sub>4</sub> (aq.) with HI (aq.) yield, for TlI (c),  $Q_f = 31.16$ . The electromotive force data of Jones and Schumb<sup>1</sup> yield  $Q_f = 29.2$ , but there may be some doubt concerning the reaction.

**TlI (g).** The vapor pressure data of von Wartenberg and Bosse<sup>1</sup> yield  $V = -25.3^{818}$ , whence, for TlI (g),  $Q_f = -0.6$ . See also Terenin.<sup>1</sup>

**TlNO<sub>3</sub> (aq.).** For the heat of neutralization of TlOH (aq.) with HNO<sub>3</sub> (aq.), Thomsen<sup>15</sup> found  $Q = 13.70$ , whence, for TlNO<sub>3</sub> (aq.),  $Q_f = 48.2$ .

**TlNO<sub>3</sub> (c, III).** Thomsen<sup>15</sup> found  $S = -10.0$ .

**TlNO<sub>3</sub> (c, II).** Bridgman<sup>6a</sup> reported, for the transition III to II,  $T = -0.24^{75}$ .

**TlNO<sub>3</sub> (c, I).** Bridgman<sup>6a</sup> reported, for the transition II to I,  $T = -0.76^{145}$ .

**TlN<sub>3</sub> (c).** Wohler and Martin<sup>1</sup> found the heat of decomposition of thallium azide to be 54.7.

**Tl<sub>2</sub>S (c).** Thomsen<sup>15</sup> and Sabatier<sup>1</sup> reported the same value, 33.7, for the heat of the reaction,  $2 \text{ TlNO}_3(200) + \text{Na}_2\text{S}(200) = \text{Ti}_2\text{S}(\text{c}) + 2 \text{ NaNO}_3(300)$ .

**TlC<sub>2</sub>H<sub>3</sub>O<sub>2</sub> (aq.).** de Forcrand<sup>69</sup> found 13.99 for the heat of neutralization of TlOH (aq.) with aqueous acetic acid; whence, for aqueous thalious acetate,  $Q = 117.4$ . From the ions, we have obtained  $Q_f = 117.0$ .

**Tl<sub>2</sub>Se (c).** Fabre<sup>6</sup> measured the heat of reaction between aqueous thalious acetate and gaseous H<sub>2</sub>Se to be 41.2, and the heat of solution of Tl<sub>2</sub>Se (c) in bromine water to be 143.5. These data yield, for Tl<sub>2</sub>Se (c),  $Q_f = 20.6$  and 11.0, respectively.

**Tl<sub>2</sub>Te (c).** Fabre<sup>6</sup> measured the heat of solution of Tl<sub>2</sub>Te (c) in bromine water to be 159.5; whence, for Tl<sub>2</sub>Te (c),  $Q_f = 7.2$ .

**TlONC (c).** Wohler and Martin<sup>1</sup> found the heat of decomposition of thallium fulminate to be 52.5, the products being CO (g),  $\frac{1}{2}$  N<sub>2</sub> (g), and Tl (c).

**TlX · nNH<sub>3</sub> (c).** Biltz and Stollenwerk<sup>1</sup> determined the heats of dissociation of the triammines of TlCl, TlBr, and TlI.

**Tl<sub>2</sub>SO<sub>4</sub> · 10NH<sub>3</sub> (c).** Ephraim and Millman<sup>1</sup> reported  $D = -13.3$ , but the products are not known.

**TlC<sub>2</sub>H<sub>5</sub>O (C<sub>2</sub>H<sub>5</sub>OH).** de Forcrand<sup>71, 71a</sup> computed  $Q = -10.4$  for the reaction,  $\text{Tl}(\text{c}) + \text{C}_2\text{H}_5\text{OH}(\text{liq.}) = \text{TlC}_2\text{H}_5\text{O}(\text{C}_2\text{H}_5\text{OH}) + \frac{1}{2} \text{H}_2(\text{g})$ , but the experimental data were not reported.

**TlBr<sub>3</sub> (aq.).** Thomsen<sup>15</sup> reported  $Q = 36.50$  for the reaction,  $\text{TlBr}_3(\text{aq.}) + \text{SO}_2(200) = \text{TlBr}(\text{c}) + 2 \text{ HBr}(200) + \text{H}_2\text{SO}_4(300)$ ; whence, for TlBr<sub>3</sub> (aq.),  $Q_f = 58.1$ .

**Tl<sup>+++</sup> (aq.).** The value for this substance is obtained from those for TlBr<sub>3</sub> (aq.) and Br<sup>-</sup> (aq.).

**TlX<sub>3</sub> · nH<sub>2</sub>O (c).** Thomas<sup>1</sup> measured the following heats of solution: TlCl<sub>3</sub>, 8.43<sub>300</sub>; TlCl<sub>3</sub> · 4 H<sub>2</sub>O (c), -2.12<sub>300</sub>; TlBr<sub>3</sub> · 4 H<sub>2</sub>O (c), -2.25<sub>500</sub>; TlBr<sub>2</sub>Cl · 4 H<sub>2</sub>O (c), -2.90<sub>300</sub>.

## ZINC

**Zn (c).** Standard state. Laschtschenko<sup>9</sup> reported a transition in solid zinc at 320° with  $T = -0.19$ , but modern evidence points to but one form of crystalline zinc.

**Zn (liq.).** The data on the heat of fusion of zinc at its melting point, 419°, are: Mazzotto,<sup>1</sup> -1.83; Glaser,<sup>1</sup> -1.73; Iitaka,<sup>1</sup> -1.50; Wust,<sup>1</sup> -1.85; Person,<sup>2</sup> -1.79; Awbery and Griffiths,<sup>1</sup> -1.74; Umino,<sup>3</sup> -1.54; Heycock and Neville,<sup>2</sup> -1.85. See also Richards<sup>1</sup> and Laschtschenko.<sup>8</sup>

**Zn (g).** According to the vapor density data of Biltz<sup>7</sup> and von Wartenberg,<sup>8</sup> gaseous zinc is practically monatomic. The vapor pressure

data of Barnes,<sup>1,2</sup> Richards,<sup>2</sup> Ruff and Bergdahl,<sup>1</sup> Braunes,<sup>1</sup> Deckert,<sup>1</sup> Greenwood,<sup>3,6</sup> Rodebush and Dixon,<sup>1</sup> Egerton,<sup>1</sup> and Jenkins<sup>3</sup> yield  $-27.4$  for the heat of sublimation, and  $-25.9$  for the heat of vaporization, at  $18^\circ$ . Millar<sup>1</sup> computed  $-27.2$  for the heat of sublimation. The direct calorimetric measurements of Whnelt and Muscelleanii,<sup>1</sup> Muscelleanii,<sup>1</sup> and Tate<sup>1</sup> yield  $-26.3$  for the heat of vaporization.

The energy states of gaseous monatomic zinc are from Saunders,<sup>1</sup> Sawyer and Beese,<sup>1</sup> Wolff,<sup>1</sup> Fowler,<sup>3</sup> Salis,<sup>1</sup> Fues,<sup>1</sup> Kayser and Runge,<sup>2</sup> and Paschen.<sup>1,2,3,5</sup>

**Zn<sub>2</sub> (g).** The spectroscopic data of Winans<sup>2</sup> yield  $D^\circ = -5.67$ . See also Mrozowski.<sup>1</sup>

**ZnCl<sub>2</sub> (aq.).** The following are the data on the heat of the reaction,  $\text{Zn (c)} + 2 \text{HCl (n)} = \text{ZnCl}_2 \text{ (2n)} + \text{H}_2 \text{ (g)}$ : Richards and Thorvaldson,<sup>1</sup>  $\text{HCl (200)}$ ,  $Q = 36.55$ ; Richards, Rowe, and Burgess,<sup>7</sup>  $\text{HCl (200)}$ ,  $Q = 36.6$ ; Thomsen,<sup>15</sup>  $\text{HCl (100)}$ ,  $Q = 34.20$ ; Hess,<sup>10</sup>  $Q = 34.9$ ; Favre and Silbermann,<sup>3</sup>  $Q = 33$ ; Richards and Thorvaldson,<sup>1</sup>  $\text{HCl (20)}$ ,  $Q = 32.79^{20}$ ; Maier,<sup>5</sup>  $\text{HCl (20)}$ ,  $Q = 32.19$ ; Sieverts and Gotta,<sup>2</sup>  $\text{HCl (20)}$ ,  $Q = 31.1^{19}$ ; Hablutzel,<sup>1</sup>  $\text{HCl (20)}$ ,  $Q = 31.5$ ; Biltz and Wagner,<sup>1</sup>  $\text{HCl (20)}$ ,  $Q = 30.06$ ; Sieverts and Gotta,<sup>3</sup>  $\text{HCl (20)}$ ,  $Q = 30.28$ ; Biltz and Hohorst,<sup>1</sup>  $\text{HCl (20)}$ ,  $Q = 30.15$ ; Sommermeier,<sup>1</sup>  $\text{HCl (20)}$ ,  $Q = 30.43$ ; Biltz and Hohorst,<sup>1</sup>  $\text{HCl (8)}$ ,  $Q = 33.55$ . The heat of dilution of aqueous zinc chloride was measured by Thomsen,<sup>15</sup> and computed from vapor pressure-temperature data by Fricke and Havestadt.<sup>1</sup>

**ZnSO<sub>4</sub> (aq.).** Thomsen<sup>15</sup> measured the heats of the reactions,  $\text{ZnSO}_4 \text{ (400)} + \text{BaCl}_2 \text{ (400)} = \text{BaSO}_4 \text{ (c)} + \text{ZnCl}_2 \text{ (800)}$  and  $\text{H}_2\text{SO}_4 \text{ (400)} + \text{BaCl}_2 \text{ (400)} = \text{BaSO}_4 \text{ (c)} + 2 \text{HCl (400)}$ , to be 5.50 and 9.15, respectively. The difference gives  $Q = -3.65$  for the reaction,  $\text{ZnSO}_4 \text{ (400)} + 2 \text{HCl (400)} = \text{H}_2\text{SO}_4 \text{ (400)} + \text{ZnCl}_2 \text{ (800)}$ ; whence, for  $\text{ZnSO}_4 \text{ (400)}$ ,  $Q_f = 251.95$ . de Forcrand<sup>8</sup> measured the heat of solution of zinc in aqueous sulfuric acid and his data yield, for  $\text{ZnSO}_4 \text{ (200)}$ ,  $Q_f = 247$ . See also Ditte<sup>5</sup> and Hess.<sup>10</sup> The heat of dilution of aqueous zinc sulfate was measured by Thomsen,<sup>15</sup> Berthelot,<sup>5</sup> and de Forcrand.<sup>8</sup>

**ZnSO<sub>4</sub> (c).** The data on the heat of solution of zinc sulfate in water are: Thomsen,<sup>15</sup> 18.54<sub>400</sub>; Mees,<sup>1</sup> 18.27<sub>400</sub>.

**ZnSO<sub>4</sub> · nH<sub>2</sub>O (c).** Thomsen<sup>15</sup> found the heat of solution of the monohydrate to be  $-10.0$ . (He also gave values for the tri- and tetrahydrates but the heat of solution-composition curve shows no breaks at these points to indicate definite hydrates.) For the hexahydrate, Thomsen<sup>15</sup> found  $S = -0.84$ . For the heptahydrate, the heat of solution data are: Thomsen,<sup>15</sup>  $-4.28_{400}$ ; Mees,<sup>1</sup>  $-4.26_{400}$ ; Favre and Silbermann,<sup>3</sup>  $-3.76$ . The dissociation pressure data of Frowein,<sup>1</sup> Muller and Erzback,<sup>4</sup> and Rolla and Accame<sup>1</sup> yield the following results:  $\text{ZnSO}_4 \cdot 7 \text{H}_2\text{O (c)} = \text{ZnSO}_4 \cdot 6 \text{H}_2\text{O (c)} + \text{H}_2\text{O (g)}$ ,  $Q = -13.26$ ;  $\text{ZnSO}_4 \cdot 6 \text{H}_2\text{O (c)} = \text{ZnSO}_4 \cdot 5 \text{H}_2\text{O (c)} + \text{H}_2\text{O (g)}$ ,  $Q = 5 (-13.36)$ ;  $\text{ZnSO}_4 \cdot \text{H}_2\text{O (c)} = \text{ZnSO}_4 \text{ (c)} + \text{H}_2\text{O (g)}$ ,  $Q = -15.2$ . See also Foote and Scholes,<sup>1</sup> Lescoeur,<sup>1</sup> Wiedemann,<sup>1</sup> and Ishikawa and Murooka.<sup>1</sup> From electromotive force measure-

ments, Cohen and Inouye<sup>1</sup> found  $Q = 3.605^{39}$  for the reaction  $\text{ZnSO}_4 \cdot 7 \text{H}_2\text{O} (\text{c}) = \text{ZnSO}_4 \cdot 6 \text{H}_2\text{O} (\text{c}) + \text{H}_2\text{O} (\text{aq. satd. soln.})$ .

**$\text{Zn}^{++} (\text{aq.})$ .** We have obtained the value for this substance from those for  $\text{ZnCl}_2 (\text{aq.})$  and  $\text{ZnSO}_4 (\text{aq.})$ . See also Getman and Gibbons<sup>1</sup> and Latimer.<sup>2</sup>

**$\text{ZnO} (\text{c.})$ .** The heat of solution of unfused zinc oxide in aqueous hydrochloric acid was measured by Favre and Silbermann,<sup>3</sup> Hess,<sup>10</sup> Maier,<sup>5</sup> Parks, Hablutzel, and Webster,<sup>1</sup> and Maier, Parks, and Anderson.<sup>1</sup> Apparently, the heat of solution of unfused zinc oxide is independent of the manner of its preparation. These data yield, for  $\text{ZnO} (\text{c, unfused})$ ,  $Q_f = 83.5$ . Ditté,<sup>5</sup> de Forcrand<sup>8, 9, 40, 41, 42</sup> and Marignac<sup>1</sup> measured the heat of solution of zinc oxide in aqueous sulfuric acid. Their data yield, for  $\text{ZnO} (\text{c, unfused})$ ,  $Q_f = 83.7$ , and for  $\text{ZnO} (\text{c, fused})$ ,  $Q_f = 85.5$ . See also Woods,<sup>1</sup> Berthelot,<sup>141, 142</sup> and Theis.<sup>1</sup> Parr and Moose<sup>1</sup> measured the heat of combustion of zinc to form fused zinc oxide to be 85.2. See also the old values of Dulong,<sup>1</sup> Andrews,<sup>14, 15</sup> and Despretz.<sup>2</sup>

**$\text{ZnH} (\text{g.})$ .** The energy of dissociation of gaseous zinc hydride, in the normal state, into gaseous zinc and hydrogen atoms, each in the normal state, was reported by Fukuda<sup>1</sup> and Bengtsson and Hulthen<sup>1</sup> from their spectroscopic data. The values for the higher energy states of gaseous  $\text{ZnH}$  are taken from the foregoing authors and from Grundstrom.<sup>1</sup>

**$\text{Zn}(\text{OH})_2 (\text{c, ppt.})$ .** Thomsen<sup>15</sup> measured the heat of reaction of aqueous zinc sulfate with aqueous barium hydroxide and aqueous potassium hydroxide, and his data yield for  $\text{Zn}(\text{OH})_2 (\text{c, ppt.})$ ,  $Q_f = 155.3$ . de Forcrand<sup>8</sup> measured the heat of solution of  $\text{Zn}(\text{OH})_2 (\text{c, ppt.})$  in  $\text{H}_2\text{SO}_4 (200)$  to be 18.9, which gives  $Q_f = 155.3$ . See also Mixter.<sup>11</sup>

**$\text{Zn}(\text{OH})_2 (\text{c, not ppt.})$ .** The electromotive force data of Maier, Parks, and Anderson<sup>1</sup> yield for this substance  $Q_f = 155.84$ , but the cell reaction may be somewhat uncertain.

**$\text{Zn}(\text{OH})_2 \cdot \text{H}_2\text{O} (\text{c, ppt.})$ .** de Forcrand<sup>8</sup> measured the heat of solution of this substance in  $\text{H}_2\text{SO}_4 (200)$ .

**$\text{ZnO}_2 \cdot 2 \text{H}_2\text{O} (\text{c.})$ .** de Forcrand<sup>8</sup> measured the heat of solution in  $\text{H}_2\text{SO}_4 (200)$ .

**$\text{Zn}_3\text{O}_5 \cdot n \text{H}_2\text{O} (\text{c.})$ .** de Forcrand<sup>8</sup> measured the heats of solution of the di- and trihydrates in  $\text{H}_2\text{SO}_4 (200)$ .

**$\text{ZnF}_2 (\text{aq.})$ .** Petersen<sup>1</sup> measured the heat of the reaction of aqueous zinc chloride with solid silver fluoride to be 31.84. Mulert<sup>1</sup> measured the heat of solution of  $\text{ZnO}$  in aqueous (20%)  $\text{HF}$  to be 21.82. See also Jellinek and Rudat.<sup>1</sup>

**$\text{ZnCl}_2 (\text{c.})$ .** The data on the heat of solution of solid zinc chloride in water are: Thomsen,<sup>15</sup> 15.72<sub>400</sub>; Pickering,<sup>8</sup> 15.22<sub>400</sub>; Baud,<sup>1</sup> 15.89<sub>400</sub><sup>15</sup>; Ishikawa and Murooka,<sup>1</sup> 16.71<sub>400</sub>. See also Andrews<sup>16</sup> and Favre and Silbermann.<sup>3</sup> The use of Thomsen's value yields, for  $\text{ZnCl}_2 (\text{c.})$ ,  $Q_f = 99.6$ . The data of Klemm and Brautigan,<sup>1</sup> who measured in an ice calorimeter the heats of solution of  $\text{Zn} (\text{c.})$ ,  $\text{Cl}_2 (\text{g.})$ , and  $\text{ZnCl}_2 (\text{c.})$ , in aqueous (33%)  $\text{KBr}$  containing excess liquid  $\text{Br}_2$ , yield, for  $\text{ZnCl}_2 (\text{c.})$ ,  $Q_f = 99.8$ . The

electromotive force data of Foxton and Shutt,<sup>1</sup> on the cell in which the reaction was  $\text{Zn (c)} + \text{Cl}_2 \text{ (g)} = \text{ZnCl}_2 \text{ (11.11)}$ , give  $Q^{70} = 105.4$ .

$\text{ZnCl}_2 \cdot (\text{C}_2\text{H}_5\text{OH})$ . Pickering<sup>8</sup> measured the heat of solution of zinc chloride in ethyl alcohol.

$\text{ZnCl}_2 \cdot n\text{ZnO} \cdot n'\text{H}_2\text{O (c)}$ . Andre<sup>1</sup> measured the heats of solution of  $\text{ZnCl}_2 \cdot 3\text{ZnO} \cdot 5\text{H}_2\text{O (c)}$ ,  $\text{ZnCl}_2 \cdot 4\text{ZnO} \cdot 11\text{H}_2\text{O (c)}$ ,  $\text{ZnCl}_2 \cdot 5\text{ZnO} \cdot 8\text{H}_2\text{O (c)}$ , and  $\text{ZnCl}_2 \cdot 8\text{ZnO} \cdot 10\text{H}_2\text{O (c)}$ .

$\text{ZnBr}_2 \text{ (aq.)}$ . The value for this substance is obtained from those for the ions, and by analogy with  $\text{ZnCl}_2 \text{ (aq.)}$ .

$\text{ZnBr}_2 \text{ (c)}$ . The data on the heat of solution of zinc bromide are: Thomsen,<sup>15</sup> 15.02<sub>400</sub>; Andre,<sup>1</sup> 13.8<sup>5</sup>. The use of Thomsen's value gives, for  $\text{ZnBr}_2 \text{ (c)}$ ,  $Q_f = 78.3$ . From electromotive force data, Ishikawa and Yoshida<sup>1</sup> computed, for  $\text{ZnBr}_2 \text{ (c)}$ ,  $Q_f = 78.47$ . See also Czepinski<sup>2</sup> and Andrews.<sup>3</sup>

$\text{ZnBr}_2 \cdot 4\text{ZnO} \cdot 13\text{H}_2\text{O (c)}$ . Andre<sup>1</sup> measured the heat of solution.

$\text{ZnI}_2 \text{ (aq.)}$ . The value for this substance is obtained from those for the ions, and by analogy with  $\text{ZnCl}_2 \text{ (aq.)}$ , to be 62.3 for  $\text{ZnI}_2 \text{ (600)}$ . Webb<sup>1,2</sup> measured the heat of solution of zinc in iodine water to form  $\text{ZnI}_2 \text{ (650)}$ , and computed, for the latter,  $Q_f = 61.4$ .

$\text{ZnI}_2 \text{ (c)}$ . Webb<sup>1,2</sup> measured the heat of solution of zinc iodide in water to be 11.6<sub>650</sub>, whence, for  $\text{ZnI (c)}$ ,  $Q_f = 49.8$ . See also Andrews.<sup>2</sup> Mosnier<sup>1</sup> found  $S = 11.4$ . Webb's<sup>1,2</sup> data on the cell in which  $\text{ZnI}_2 \text{ (c)}$  was formed from its elements gave  $Q_f = 49.90$ . Similar data by Ishikawa and Shibata<sup>1</sup> yield  $Q_f = 51.2$ .

$\text{ZnI}_2 \cdot 5\text{ZnO} \cdot 11\text{H}_2\text{O (c)}$ . Tassilly<sup>1</sup> measured the heat of solution in aqueous HI to be 115.6.

$\text{ZnI (g)}$ . Sponer<sup>4</sup> estimated  $D^z = -46$ , from spectroscopic data, for the dissociation into gaseous normal zinc and iodine atoms. Wieland<sup>1</sup> reported a value for the energy of the excited state of gaseous  $\text{ZnI}$ .

$\text{Zn(C}_2\text{H}_3\text{O}_2)_2 \text{ (aq.)}$ . Thomsen<sup>15</sup> measured the heat of the reaction of aqueous barium acetate and zinc sulfate,  $\text{Ba(C}_2\text{H}_3\text{O}_2)_2 \text{ (200)} + \text{ZnSO}_4 \text{ (200)} = \text{BaSO}_4 \text{ (c)} + \text{Zn(C}_2\text{H}_3\text{O}_2)_2 \text{ (400)}$ , to be 4.61; whence, for  $\text{Zn(C}_2\text{H}_3\text{O}_2)_2 \text{ (400)}$ ,  $Q_f = 270.9$ . Berthelot<sup>5</sup> measured the heat of reaction of aqueous zinc acetate with aqueous sodium hydroxide to be 10.8. See also Favre and Silbermann.<sup>3</sup> The heat of dilution of aqueous zinc acetate was measured by Thomsen.<sup>15</sup> See also Berthelot.<sup>5</sup>

$\text{ZnS (c)}$ . Thomsen<sup>15</sup> measured the heat of reaction of aqueous zinc sulfate with aqueous sodium sulfide, his data yielding, for  $\text{ZnS (c, ppt.)}$ ,  $Q_f = 44.3$ . The data of Mixter,<sup>15</sup> who measured in a bomb calorimeter the reaction of  $\text{ZnS}$  with  $\text{Na}_2\text{O}_2$ , yield, for  $\text{ZnS (c, zinc blende)}$ ,  $Q_f = 41.3$ . See also Berthelot<sup>14</sup> and Jellinek and Zakowsky.<sup>1</sup>

$\text{ZnS}_2\text{O}_4 \text{ (aq.)}$ . Berthelot measured the heat of oxidation with oxygen of an aqueous solution containing zinc, sodium, and, presumably, hydro-sulfite ions, to be 67.8.

$\text{ZnS}_2\text{O}_6 \cdot 6\text{H}_2\text{O (c)}$ . Thomsen<sup>15</sup> measured the heat of solution.

$\text{ZnSe (c)}$ . Fabre<sup>8</sup> measured the heat of reaction of aqueous zinc ace-

tate with gaseous  $\text{H}_2\text{Se}$  and aqueous  $\text{Na}_2\text{Se}$  to be 23.3 and 32.7, respectively, whence, for  $\text{ZnSe}$  (c),  $Q_f = 39.6$  and 34.6. Fabre<sup>3</sup> also measured the heat of the reaction of zinc selenide with water and bromine to be 100.0; whence, for  $\text{ZnSe}$  (c),  $Q_f = 33.4$ .

**ZnTe (c).** Fabre<sup>3</sup> measured the heat of the reaction of zinc telluride with water and bromine, and his data yield, for  $\text{ZnTe}$  (c),  $Q_f = 33$ .

**$\text{ZnN}_6$  (c).** Wohler and Martin<sup>1</sup> measured the heat of decomposition of zinc azide into  $\text{Zn}$  (c) and  $3 \text{N}_2$  (g) to be 50.8.

**$\text{Zn}(\text{NO}_3)_2$  (aq.).** Thomsen<sup>15</sup> measured the heat of reaction of  $\text{Zn}(\text{OH})_2$  (c, ppt.) with aqueous nitric acid to form  $\text{Zn}(\text{NO}_3)_2$  (400), to be 19.83. The heat of dilution of aqueous zinc nitrate was measured by Thomsen.<sup>15</sup> We have extrapolated the values to  $3 \text{H}_2\text{O}$ .

**$\text{Zn}(\text{NO}_3)_2 \cdot n\text{H}_2\text{O}$  (c).** Thomsen<sup>15</sup> measured the heat of solution of hexahydrate. Morgan and Owens<sup>1</sup> determined the heat of fusion of the trihydrate.

**$\text{ZnF}_2 \cdot 2 \text{H}_2\text{O} \cdot n\text{NH}_3$  (c).** Biltz and Ralphs<sup>2</sup> reported  $Q = 2\frac{1}{2}$  (11.2) for the dissociation,  $\text{ZnF}_2 \cdot 2 \text{H}_2\text{O} \cdot 3 \text{NH}_3$  (c) =  $\text{ZnF}_2 \cdot 2 \text{H}_2\text{O} \cdot \frac{1}{2} \text{NH}_3$  (c) +  $2\frac{1}{2} \text{NH}_3$  (g).

**$\text{ZnX}_2 \cdot n\text{NH}_3$  (c).** Biltz and Messerknecht<sup>1</sup> obtained dissociation pressure-temperature data on the amines of  $\text{ZnCl}_2$  with 1, 2, 4, 6, and 10  $\text{NH}_3$ , on those of  $\text{ZnBr}_2$  with 1, 2, 4, and 6  $\text{NH}_3$ , and on those of  $\text{ZnI}_2$  with 1, 2, 4, and 6  $\text{NH}_3$ . Ephraim<sup>9</sup> obtained similar data on the hexamines of  $\text{ZnCl}_2$  and  $\text{ZnBr}_2$ . Isambert<sup>5</sup> measured the heat of solution of the decamine of  $\text{ZnCl}_2$  in aqueous  $\text{HCl}$ ; Biltz and Messerknecht<sup>1</sup> those of the di-, tetra- and hexamines of  $\text{ZnCl}_2$ ; Tassilly<sup>1</sup> those of the tetramines of  $\text{ZnBr}_2$  and  $\text{ZnI}_2$  and the diammine of  $\text{ZnI}_2$ .

**$\text{Zn}(\text{XO}_3)_2 \cdot n\text{NH}_3$  (c).** Ephraim and Jahnsen<sup>1</sup> obtained dissociation pressure data on  $\text{Zn}(\text{ClO}_3)_2 \cdot 4 \text{NH}_3$  (c),  $\text{Zn}(\text{ClO}_3)_2 \cdot 6 \text{NH}_3$  (c), and  $\text{Zn}(\text{IO}_3)_2 \cdot 4 \text{NH}_3$  (c). Ephraim and Bolle<sup>1</sup> obtained similar data on the tetra- and hexamines of zinc chlorate.

**$\text{Zn}(\text{ClO}_4)_2 \cdot 6 \text{NH}_3$  (c).** Ephraim and Bolle<sup>1</sup> measured the dissociation pressures.

**$\text{Zn}(\text{NO}_3)_2 \cdot n\text{NH}_3$  (c).** Ephraim and Bolle<sup>1</sup> measured the dissociation pressure at various temperatures of the tetra- and hexamines of zinc nitrate.

**$\text{Zn}(\text{C}_2\text{H}_3\text{O}_2)_2 \cdot 2 \text{NH}_3$  (c).** Ephraim and Bolle<sup>1</sup> measured the dissociation pressures.

**$\text{Zn}(\text{NO}_2)_2 \cdot \text{NH}_3$  (c).** Ephraim and Bolle<sup>1</sup> measured the dissociation pressures.

**$\text{ZnSO}_3 \cdot 3 \text{NH}_3$  (c).** Ephraim and Bolle<sup>1</sup> measured the dissociation pressures.

**$\text{ZnS}_2\text{O}_6 \cdot 4 \text{NH}_3 \cdot \text{H}_2\text{O}$  (c).** Ephraim and Bolle<sup>1</sup> obtained dissociation pressure data.

**$\text{Zn}(\text{CNS})_2 \cdot n\text{NH}_3$  (c).** Ephraim and Bolle<sup>1</sup> obtained dissociation pressure data on the tetra- and hexamines of  $\text{Zn}(\text{CNS})_2$ .

$\text{ZnS}_2\text{O}_6 \cdot 5 \text{NH}_3$  (c.). Ephraim and Bolle<sup>1</sup> obtained dissociation pressure data.

$\text{ZnS}_4\text{O}_6 \cdot 5 \text{NH}_3$  (c.). Ephraim and Bolle<sup>1</sup> measured the dissociation pressures.

$\text{ZnS}_2\text{O}_3 \cdot 5 \text{NH}_3$  (c.). Ephraim and Bolle<sup>1</sup> measured the dissociation pressures.

$\text{Zn}(\text{CHO}_2)_2 \cdot 5 \text{NH}_3$  (c.). Ephraim and Bolle<sup>1</sup> measured the dissociation pressures.

$\text{ZnC}_2\text{O}_4 \cdot 5 \text{NH}_3$  (c.). Ephraim and Bolle<sup>1</sup> measured the dissociation pressures.

$\text{ZnCl}_2 \cdot 5 \text{NH}_3 \cdot \text{H}_2\text{O}$  (c.). Andre<sup>1</sup> measured the heat of solution in  $\text{HCl}(100)$ .

$\text{ZnCl}_2 \cdot 2 \text{NH}_3 \cdot \frac{1}{4} \text{H}_2\text{O}$  (c.). Andre<sup>1</sup> measured the heat of solution in  $\text{HCl}(100)$ .

$\text{ZnCl}_2 \cdot 8 \text{NH}_4\text{Cl} \cdot \text{ZnO}$  (c.). Andre<sup>1</sup> measured the heat of solution in  $\text{HCl}(100)$ .

$3 \text{ZnCl}_2 \cdot 6 \text{NH}_4\text{Cl} \cdot \text{H}_2\text{O}$  (c.). Andre<sup>1</sup> measured the heat of solution in  $\text{HCl}(100)$ .

$3 \text{ZnCl}_2 \cdot \text{ZnO} \cdot 10 \text{NH}_4\text{Cl}$  (c.). Andre<sup>1</sup> measured the heat of solution.

$6 \text{ZnCl}_2 \cdot \text{ZnO} \cdot 12 \text{NH}_3$  (c.). Andre<sup>1</sup> measured the heat of solution.

$\text{ZnSO}_4 \cdot n \text{NH}_3$  (c.). The values for the ammines of zinc sulfate with  $\frac{1}{2}$ , 1, 2, 3, 4, and 5  $\text{NH}_3$  are taken from the work of Ephraim<sup>8, 10</sup> and Ephraim and Bolle.<sup>1</sup>

$\text{Zn}(\text{NH}_4)_2(\text{SO}_4)_2 \cdot n \text{H}_2\text{O}$  (c.). Graham<sup>2</sup> measured the heat of solution of the hexahydrate. Caven and Ferguson<sup>2</sup> measured the dissociation pressures of the system containing the hexahydrate, dihydrate, and water vapor.

$\text{Zn}(\text{NH}_4)_2(\text{SeO}_4)_2 \cdot 6 \text{H}_2\text{O}$  (c.). Caven and Ferguson<sup>2</sup> measured the dissociation pressure to the dihydrate.

$\text{Zn}(\text{C}_2\text{H}_5)_2$  (liq.). Guntz<sup>9</sup> measured the heat of solution of liquid zinc ethyl in aqueous sulfuric and hydrochloric acids to be 79.8 and 78.0, respectively. Correcting for the heat of mixing gives, for  $\text{Zn}(\text{C}_2\text{H}_5)_2$  (liq.),  $Q_f = 10.0$ .

$\text{ZnC}_2\text{O}_4 \cdot 2 \text{H}_2\text{O}$  (c.). Berthelot<sup>10</sup> reported the heat of the reaction,  $\text{Zn}(\text{OH})_2(\text{c}) + \text{H}_2\text{C}_2\text{O}_4(\text{aq.}) = \text{ZnC}_2\text{O}_4 \cdot 2 \text{H}_2\text{O}(\text{c})$ , to be  $Q = 25.0$ . This was derived from his unpublished figures on the reaction between zinc sulfate and potassium oxalate.

$\text{ZnCO}_3$  (c.). Berthelot's<sup>12</sup> data on the heats of reaction of aqueous zinc sulfate with aqueous sodium carbonate and aqueous potassium carbonate yield, for  $\text{ZnCO}_3$  (c),  $Q_f = 192.4$  and 194.2.

$\text{Zn}(\text{CHO}_2)_2$  (aq.). Berthelot<sup>9, 131</sup> reported a value for the heat of neutralization of formic acid with zinc hydroxide.

$\text{Zn}(\text{CHO}_2)_2$  (c.). Berthelot<sup>9, 131</sup> measured the heat of solution of zinc formate.

$\text{Zn}(\text{CHO}_2)_2 \cdot 2 \text{H}_2\text{O}$  (c.). Berthelot<sup>9, 131</sup> measured the heat of solution of the dihydrate.

$\text{Zn}(\text{C}_2\text{H}_3\text{O}_2)_2$  (c). Berthelot<sup>9, 131</sup> measured the heat of solution of zinc acetate.

$\text{Zn}(\text{C}_2\text{H}_3\text{O}_2)_2 \cdot n\text{H}_2\text{O}$  (c). Berthelot<sup>9, 131</sup> measured the heats of solution of the mono- and dihydrates.

$\text{Zn}(\text{C}_2\text{H}_3\text{O}_3)_2$  (aq.). de Forcrand<sup>3</sup> measured the heat of reaction of zinc sulfate with barium glycolate.

$\text{Zn}(\text{C}_2\text{H}_3\text{O}_3)_2 \cdot n\text{H}_2\text{O}$  (c). de Forcrand<sup>3</sup> measured the heats of solution of the anhydrous zinc glycolate and of the dihydrate.

$\text{Zn}(\text{CN})_2$  (c). Joannis<sup>1</sup> and Berthelot<sup>114</sup> measured the heat of precipitation of zinc cyanide. We have used the data of Joannis.

$\text{Zn}(\text{CN})_4^-$  (aq.). Berthelot measured the heat of solution of  $\text{Zn}(\text{CN})_2$  (c) in aqueous KCN to be 8.6.

$\text{ZnSiO}_3$  (c). Mulert<sup>1</sup> measured the heat of solution in aqueous 20% HF.

$\text{Zn}_2\text{SiO}_4$  (gls.). Mulert<sup>1</sup> measured the heat of solution in aqueous 20% HF.

$\text{Zn}_2\text{SiO}_4$  (c). Mulert<sup>1</sup> measured the heat of solution in aqueous 20% HF.

$\text{ZnSn}_n$  (c). Herschowitz<sup>2</sup> computed the heats of formation of the solid alloys,  $\text{ZnSn}_2$ ,  $\text{ZnSn}_{0.6}$ ,  $\text{ZnSn}_{0.21}$ , and  $\text{ZnSn}_{0.1}$ , from his data on heats of solution in bromine water. See also Magnus and Mannheimer.<sup>1</sup>

$2\text{ZnI}_2 \cdot \text{PbI}_2$  (c). Mosnier<sup>1</sup> measured the heat of solution.

## CADMIUM

**Cd (c).** The hexagonal form is taken as the standard state. Getman<sup>1</sup> found  $T = -0.055$  for the transition from II to I at  $37.5^\circ$ . Cohen and Heldermaun,<sup>1, 3</sup> reported a transition from III to II at  $18^\circ$  with  $T = -0.74$ , but the X-ray and other data of Getman<sup>1</sup> can not be reconciled to the existence of a third form of cadmium.

**Cd (liq.).** The data on the heat of fusion of cadmium at its melting point,  $321^\circ$ , are: Umino,<sup>3</sup>  $-1.45$ ; Wust, Meuthen and Durrer,<sup>1</sup>  $-1.23$ ; Person,<sup>1</sup>  $-1.54$ ; Richards,<sup>1</sup>  $-1.48$ ; Johnston and Adams,<sup>2</sup>  $-1.54$ ; Roos,<sup>2</sup>  $-1.49$ .

**Cd (g).** Vapor pressure data for cadmium were reported by Maier,<sup>3</sup> Egerton,<sup>1</sup> Jenkins,<sup>3</sup> Barus,<sup>1, 2</sup> Ruff and Bergdahl,<sup>1</sup> Braune,<sup>1</sup> Fogler and Rodebush,<sup>1</sup> Bennowitz,<sup>1</sup> and Weber.<sup>1</sup> By direct measurement, Wehnelt and Muscelleanii<sup>1</sup> obtained the value  $-20.4$  for the heat of vaporization of liquid cadmium. Calculations of the heat of vaporization were made by Johnston,<sup>6</sup> van Liempt,<sup>2</sup> Hildebrand,<sup>2</sup> Millar,<sup>1</sup> and Maier.<sup>3</sup> Maier's<sup>3</sup> equation yields, for Cd (g),  $Q_f = -26.8$ . The vapor density data of Biltz<sup>7</sup> and Deville and Troost<sup>1</sup> indicate that gaseous cadmium is practically monatomic, as do the entropy calculations of Tolman,<sup>1</sup> Fogler and Rodebush,<sup>1</sup> and Lange and Simon.<sup>1</sup>

The energy states of gaseous monatomic cadmium are evaluated from the work of Fowler,<sup>3</sup> Fues,<sup>1</sup> and Salis.<sup>1</sup>

**Cd<sub>2</sub> (g).** The spectroscopic data of Winans<sup>1, 2</sup> gave  $D^\circ = -5$ , while

the later work of Kuhn and Arrhenius<sup>1</sup> gave  $D^\circ = -46$ . See also Mrozowski.<sup>2</sup>

**CdCl<sub>2</sub> (aq.).** The data on the heat of solution of Cd (c) in 2HCl(200) are: Thomsen,<sup>15</sup> 17.61; Richards, Rowe, and Burgess,<sup>1</sup> 17.12; Richards and Tamaru,<sup>1</sup> 17.15. Data on the heat of dilution of aqueous cadmium chloride were obtained by Thomsen.<sup>15</sup> The value,  $Q = -0.062$ , reported by Cohen and Bruins<sup>3</sup> for the dilution from 9.192 to 400 H<sub>2</sub>O seems unreasonable.

**CdCl<sub>2</sub> (c).** The data on the heat of solution of cadmium chloride are: Cohen and Bruins,<sup>3</sup> 3.09<sub>400</sub>; Thomsen,<sup>15</sup> 3.01<sub>400</sub>; Pickering,<sup>6</sup> 3.39<sub>400</sub>; Berthelot,<sup>69</sup> 3.0; Agostini,<sup>2</sup> 2.07<sub>500</sub><sup>?</sup>. See also Lorenz and Hering,<sup>2</sup> Lorenz and Fox,<sup>1</sup> and Weber.<sup>1</sup>

**CdCl<sub>2</sub> (liq.).** Weber<sup>1</sup> found  $F = -10.5^{566}$ .

**CdCl<sub>2</sub> · H<sub>2</sub>O (c).** Pickering<sup>6</sup> found  $S = 0.62$ . Thomsen<sup>15</sup> reported  $S = 0.76$  for a dihydrate, but undoubtedly his sample was the monohydrate.

**CdCl<sub>2</sub> · 2½ H<sub>2</sub>O (c).** Cohen and Bruins<sup>3</sup> found  $S = -2.94_{400}$ ; Pickering<sup>6</sup> reported  $S = -2.29$  for a dihydrate, but his sample must have been largely the hydrate with 2½ H<sub>2</sub>O. The former value yields, for CdCl<sub>2</sub> · 2½ H<sub>2</sub>O (c),  $Q_f = 269.93$ . Electromotive force data on the cell reaction, Cd (c) + PbCl<sub>2</sub> (c) + 2½ H<sub>2</sub>O (satd. soln.) = CdCl<sub>2</sub> · 2½ H<sub>2</sub>O (c) + Pb (c), were obtained by Vosburg<sup>1</sup> and Taylor and Perrott.<sup>1</sup> The latter investigators also obtained data on the analogous cells with AgCl (c) and HgCl (c). These data yield, respectively, for CdCl<sub>2</sub> · 2½ H<sub>2</sub>O (c),  $Q_f = 270.02, 269.90, 269.42$ , and 269.58. The values from the cell with lead chloride are probably the best. See also Getman.<sup>3</sup>

**CdCl<sub>2</sub> · 4H<sub>2</sub>O (c).** Worobiew<sup>1</sup> reported  $Q = -0.76$  for the heat of congruent melting of the tetrahydrate.

**CdCl<sub>2</sub> · 2HCl · 7H<sub>2</sub>O (c).** Berthelot<sup>69</sup> measured the heat of solution.

**CdCl<sub>2</sub> · CdO · H<sub>2</sub>O (c).** Tassilly<sup>1</sup> measured the heat of solution.

**CdSO<sub>4</sub> (aq.).** Thomsen<sup>15</sup> found  $Q = 5.74$  for the heat of the reaction of CdSO<sub>4</sub>(200) with BaCl<sub>2</sub>(200); whence, for CdSO<sub>4</sub>(200),  $Q_f = 232.70$ . Holsboer<sup>1</sup> measured the heat of dilution of aqueous cadmium sulfate. See also von Steinwehr,<sup>1</sup> Ishikawa,<sup>2</sup> and Ishikawa and Murooka.<sup>1</sup>

**CdSO<sub>4</sub> (c).** For the heat of solution, Thomsen<sup>15</sup> found 10.74<sub>400</sub>; Cohen, Helderman, and Moesveld,<sup>1</sup> 10.69<sub>400</sub>.

**CdSO<sub>4</sub> · H<sub>2</sub>O (c).** Thomsen<sup>15</sup> measured the heat of solution.

**CdSO<sub>4</sub> · 2½ H<sub>2</sub>O (c).** The data on the heat of solution are: Thomsen,<sup>15</sup> 2.66<sub>400</sub>; Cohen, Helderman, and Moesveld,<sup>1</sup> 2.54<sub>400</sub>; Holsboer,<sup>1</sup> 2.67. See also Kohnstamm and Cohen<sup>1</sup> and Carpenter and Jette.<sup>1</sup>

**CdSO<sub>4</sub> · 2½ H<sub>2</sub>O (c).** Matignon<sup>18</sup> measured the heat of solution.

**CdS<sub>2</sub>O<sub>6</sub> (aq.).** Thomsen<sup>15</sup> measured the heat of the reaction of BaS<sub>2</sub>O<sub>6</sub>(400) with CdSO<sub>4</sub>(400) to be 5.60.

**Cd<sup>++</sup> (aq.).** Extrapolation to infinite dilution of the values for CdCl<sub>2</sub> (aq.) and for CdSO<sub>4</sub> (aq.) yield for, Cd<sup>++</sup>(∞),  $Q_f = 17.1$  and 17.6,

respectively. The latter value is probably the more accurate on account of the less uncertain extrapolation. See also Latimer.<sup>2</sup>

**CdO (c).** For the heat of combustion of cadmium to form CdO (c), Moose and Parr<sup>1</sup> found the value 65.2, Mixer<sup>15</sup> found 64.2. Mixer's<sup>15</sup> data on the reaction of Cd (c) with Na<sub>2</sub>O<sub>2</sub> (c) yield, for CdO (c),  $Q_f = 60$ , but this value is not as accurate as the directly measured ones.

**Cd<sub>4</sub>O (c).** Tanatar<sup>7</sup> claimed to have formed this substance, and measured its heat of solution to be 16.9 and 13.9 in aqueous H<sub>2</sub>SO<sub>4</sub> and aqueous HCl, respectively.

**CdH (g).** The values for the energies of dissociation and excitation of gaseous CdH are from the works of Bengtsson and Hulthen,<sup>1</sup> Svensson,<sup>2</sup> and Bengtsson and Rydberg.<sup>1</sup>

**Cd(OH)<sub>2</sub> (c).** Thomsen<sup>15</sup> measured the heats of the reactions, CdSO<sub>4</sub>(400) + Ba(OH)<sub>2</sub>(400) = Cd(OH)<sub>2</sub>(c) + BaSO<sub>4</sub>(c) and CdSO<sub>4</sub>(400) + 2KOH(200) = Cd(OH)<sub>2</sub>(c) + K<sub>2</sub>SO<sub>4</sub>(800), to be 13.07 and 7.07, respectively. From these data we have obtained, for Cd(OH)<sub>2</sub>(c),  $Q_f = 133.6$ . For the reaction of CdCl<sub>2</sub>(aq.) with 2KOH(aq.), Agostini<sup>2</sup> found  $Q = 5.66$ . From electromotive force data on the cell in which the reaction was presumably Cd(c) + HgO(c) + H<sub>2</sub>O(liq.) = Hg(liq.) + Cd(OH)<sub>2</sub>(c), Maier<sup>4</sup> found  $Q = 36.4$ .

**CdF<sub>2</sub> (aq.).** Petersen<sup>3</sup> measured the heat of the reaction of CdCl<sub>2</sub>(aq.) with 2AgF(c) to be 31.9. Mulert<sup>1</sup> measured the heat of solution of CdO(c) in aqueous (20%) HF to be 23.45.

**CdBr<sub>2</sub> (aq.).** Thomsen<sup>15</sup> measured the heats of reaction of BaBr<sub>2</sub>(200) with CdSO<sub>4</sub>(200) and with H<sub>2</sub>SO<sub>4</sub>(200) to be 6.88 and 9.54, respectively; whence, for CdBr<sub>2</sub>(400),  $Q_f = 76.17$ . From direct measurement, Nernst<sup>6</sup> obtained, for CdBr<sub>2</sub>(aq.),  $Q_f = 76.3$ . Getman<sup>3</sup> obtained electromotive force data on the cell in which the reaction was CdBr<sub>2</sub>(aq., satd.) + Hg(liq.) = Cd(c) + Hg<sub>2</sub>Br<sub>2</sub>(c). He found  $Q = 25.66$ ; whence, for CdBr<sub>2</sub>(aq., satd.),  $Q_f = 74.9$ . See also Herschkowitsch.<sup>2</sup>

**CdBr<sub>2</sub> (c).** The data on the heat of solution are: Thomsen,<sup>15</sup> 0.44<sub>400</sub>; Varet,<sup>2</sup> 0.4<sup>15</sup>.

**CdBr<sub>2</sub> (liq.).** Weber<sup>1</sup> found  $F = -5.0^{80}$ . See also Lorenz and Fox.<sup>1</sup>

**CdBr<sub>2</sub> · 4H<sub>2</sub>O (c).** Thomsen<sup>15</sup> measured the heat of solution.

**CdBr<sub>2</sub> · CdO · H<sub>2</sub>O (c).** Tassilly<sup>1</sup> measured the heat of solution in aqueous HBr.

**CdBr (g).** Sponer<sup>4</sup> estimated  $D^{\circ} = -60$ . Wieland<sup>1</sup> reported the energy of excitation.

**CdI<sub>2</sub> (aq.).** Thomsen<sup>15</sup> measured the heats of reaction of BaI<sub>2</sub>(200) with CdSO<sub>4</sub>(200) and with H<sub>2</sub>SO<sub>4</sub>(200) to be 9.61 and 9.55, respectively; whence, for CdI<sub>2</sub>(400),  $Q_f = 47.6$ .

**CdI<sub>2</sub> (c).** Thomsen<sup>15</sup> found  $S = -0.96_{400}$ . Taylor and Perrott<sup>1</sup> measured the heats of the reaction of 2KI(aq.) with Cd(c) + I<sub>2</sub>(c) and with CdI<sub>2</sub>(c), to be 52.37 and 3.93, respectively; whence, for CdI<sub>2</sub>(c),  $Q_f = 48.44$ . The electromotive force data of Taylor and Perrott<sup>1</sup> yield, for CdI<sub>2</sub>(c),  $Q_f = 48.18$  and 48.97. Similar data by Vosburg<sup>1</sup> yield 48.37.

See also Yoshida,<sup>1</sup> Cohen, Hetterschij, and Moesveld,<sup>1</sup> Cohen and Bruins,<sup>1, 2, 4</sup> and Wasastjerna.<sup>1</sup>

**CdI<sub>2</sub> (liq.).** We have estimated the heat of fusion.

**CdI<sub>2</sub> (g).** Schmidt and Walter<sup>1</sup> calculated  $V = -28.7^{700}$ .

**CdI<sub>2</sub> (CH<sub>3</sub>OH).** Timofejew<sup>2</sup> measured the heat of solution of cadmium iodide in methyl alcohol.

**CdI<sub>2</sub> (C<sub>2</sub>H<sub>5</sub>OH).** Timofejew<sup>2</sup> measured the heat of solution in ethyl alcohol.

**CdI (g).** Sponer<sup>4</sup> estimated  $D^{\circ} = -32$ . Wieland<sup>1</sup> gave a value for the energy of excitation.

**CdI<sub>2</sub> · CdO · H<sub>2</sub>O (c).** Tassilly<sup>1</sup> measured the heat of solution in aqueous HI.

**CdS (c).** Thomsen<sup>15</sup> measured the heat of reaction of aqueous CdSO<sub>4</sub> with aqueous Na<sub>2</sub>S, obtaining  $Q = 27.12$ ; whence, for CdS (c),  $Q_f = 34.6$ . Mixer's<sup>15</sup> data on the reaction of CdS (c) with Na<sub>2</sub>O<sub>2</sub> (c) yield  $Q_f = 35$ . See also the equilibrium data of Jellinek and Podjaski<sup>1</sup> and Jellinek and Zucker.<sup>1</sup>

**CdSe (c).** Fabre<sup>1, 2</sup> measured the heats of the reactions, CdSe (c) + 4 Br<sub>2</sub> (liq.) + 4 H<sub>2</sub>O (liq.) = (CdBr<sub>2</sub> + 6 HBr + H<sub>2</sub>SeO<sub>4</sub>) (aq.), CdSO<sub>4</sub> (500) + Na<sub>2</sub>Se (500) = Na<sub>2</sub>SO<sub>4</sub> (1000) + CdSe (c), and CdI<sub>2</sub> (500) + H<sub>2</sub>Se (500) = CdSe (c) + 2 HI (500), to be 100.0, 41.2, and 27.1, respectively; whence, for CdSe (c),  $Q_f = 17.0$ , 27.1, and 34, respectively. We have taken 25 as a very rough average.

**CdTe (c).** Fabre's<sup>3</sup> data on the reaction of CdTe (c) with bromine water yield  $Q_f = 16$ , but this value is probably not very accurate (see CdSe (c)).

**CdN<sub>6</sub> (c).** Wohler and Martin<sup>1</sup> measured the heat of decomposition into Cd (c) and 3 N<sub>2</sub> (g) to be 106.2.

**Cd(NO<sub>3</sub>)<sub>2</sub> (aq.).** Thomsen<sup>15</sup> measured the heat of the reaction of Ba(NO<sub>3</sub>)<sub>2</sub> (200) with CdSO<sub>4</sub> (200) to be 5.13; whence, for Cd(NO<sub>3</sub>)<sub>2</sub> (400),  $Q_f = 115.67$ .

**Cd(NO<sub>3</sub>)<sub>2</sub> (c).** Malquori,<sup>1</sup> from equilibrium data, computed  $Q = 55.9^{260}$  for the reaction, 2 Cd(NO<sub>3</sub>)<sub>2</sub> (c) = CdO (c) + 4 NO<sub>2</sub> (g) + 2 O<sub>2</sub> (g); whence, for Cd(NO<sub>3</sub>)<sub>2</sub> (c),  $Q_f = 77.1$ . But the result seems very much too low, as it would require the heat of solution to be 40.

**Cd(NO<sub>3</sub>)<sub>2</sub> (liq.).** Reisenfeld and Milchsack<sup>1</sup> reported the heat of fusion.

**Cd(NO<sub>3</sub>)<sub>2</sub> · nH<sub>2</sub>O (c).** Thomsen<sup>15</sup> measured the heats of solution of the mono- and tetrahydrates.

**CdCl<sub>2</sub> · nNH<sub>3</sub> (c).** Biltz, Klatte, and Rahlfs<sup>1</sup> and Biltz and Mau<sup>1</sup> obtained dissociation pressure data on the amines with 1, 2, 4, 6, and 10 NH<sub>3</sub>; Ephraim<sup>1, 9</sup> on the hexammine. Tassilly<sup>1</sup> found the heat of solution of the diammine in aqueous HCl to be 8.56.<sup>16</sup>

**CdBr<sub>2</sub> · nNH<sub>3</sub> (c).** Biltz and Mau<sup>1</sup> obtained dissociation pressure data on the amines with 1, 2, 6, and 12 NH<sub>3</sub>; Ephraim<sup>1, 9</sup> on the hexam-

mine. Tassilly<sup>1</sup> measured the heat of solution of the diammine in aqueous HBr to be 7.77.<sup>15</sup>

$\text{CdI}_2 \cdot n\text{NH}_3$  (c). Biltz and Mau<sup>1</sup> obtained dissociation pressure data on the amines with 2 and 6  $\text{NH}_3$ ; Ephraim<sup>1, 9</sup> on the hexammine. Tassilly<sup>1</sup> found the heat of solution of the diammine in aqueous HI to be 11.9.<sup>15</sup>

$\text{CdCl}_2 \cdot 4 \text{NH}_4\text{Cl}$  (c). Tassilly<sup>1</sup> measured the heat of solution.

$\text{CdCl}_2 \cdot \text{NH}_4\text{Cl} \cdot \frac{1}{2} \text{H}_2\text{O}$  (c). Tassilly<sup>1</sup> measured the heat of solution.

$\text{CdBr}_2 \cdot \text{NH}_4\text{Br} \cdot \frac{1}{2} \text{H}_2\text{O}$  (c). Tassilly<sup>1</sup> measured the heat of solution.

$\text{CdI}_2 \cdot \text{NH}_4\text{I} \cdot \frac{1}{2} \text{H}_2\text{O}$  (c). Tassilly<sup>1</sup> measured the heat of solution.

$\text{CdSO}_4 \cdot n\text{NH}_3$  (c). Ephraim<sup>8</sup> obtained dissociation pressure data on the amines with 1, 2, 5, and 6  $\text{NH}_3$ . See also Isambert<sup>3</sup> and Ephraim.<sup>10</sup>

$\text{Cd}(\text{ClO}_3)_2 \cdot n\text{NH}_3$  (c). Ephraim and Jahnson<sup>1</sup> obtained dissociation pressure data on the amines with 4 and 6  $\text{NH}_3$ .

$\text{Cd}_m\text{Sb}_n$  (c). Biltz and Haase<sup>1</sup> computed the heats of formation of CdSb and  $\text{Cd}_3\text{Sb}_2$  from the heats of solution in  $(\text{KBr} + \text{Br}_2)$  (aq.) of Cd, Sb, and the solid alloys.

$\text{CdCO}_3$  (c). Thomsen<sup>15</sup> measured the heat of reaction of  $\text{CdSO}_4$  (400) with  $\text{Na}_2\text{CO}_3$  (400) to be 0.36; whence, for  $\text{CdCO}_3$  (c),  $Q_f = 178.56$ . The equilibrium data of Andrussow<sup>1</sup> and Jander<sup>1</sup> give  $-21.8$  and  $-22.0$  for the reaction,  $\text{CdCO}_3$  (c) =  $\text{CdO}$  (c) +  $\text{CO}_2$  (g), whence  $Q_f = 181.4$ .

$\text{Cd}(\text{CN})_2$  (c). Joannis<sup>1</sup> measured the heat of solution of  $\text{Cd}(\text{CN})_2$  (c) in aqueous HCl to be 5.8,<sup>21</sup> and in aqueous  $\text{H}_2\text{SO}_4$  to be 8.3.<sup>20</sup>

$\text{Cd}(\text{ONC})_2$  (c). Wohler and Martin<sup>1</sup> measured the heat of decomposition of cadmium fulminate into  $\text{Cd}$  (c) + 2  $\text{CO}$  (g) +  $\text{N}_2$  (g) to be 89.0.

$\text{Cd}(\text{CN})_2 \cdot \text{CdO} \cdot 5 \text{H}_2\text{O}$  (c). Joannis<sup>1</sup> measured the heat of solution in aqueous sulfuric acid.

2  $\text{CdI}_2 \cdot \text{PbI}_2$  (c). Mosnier<sup>1</sup> measured the heat of solution.

$\text{CdZn}_n$  (c). Herschkowitsch<sup>2</sup> computed the heats of formation of the solid alloys,  $\text{CdZn}_{0.36}$ ,  $\text{CdZn}_{1.28}$ , and  $\text{CdZn}_{4.61}$ , from data on the heats of solution in  $(\text{KBr} + \text{Br}_2)$  (aq.).

$\text{CdPb}_n$  (c). See Magnus and Mannheimer.<sup>1</sup>

$\text{CdSn}_n$  (c). See Magnus and Mannheimer.<sup>1</sup>

## MERCURY

$\text{Hg}$  (liq.). Standard state.

$\text{Hg}$  (g). The vapor pressure of mercury, whose vapor is practically monatomic, was studied by Stock and Zimmerman,<sup>1</sup> Hertz,<sup>1</sup> Thorpe,<sup>1</sup> Hagen,<sup>1</sup> Ruff and Bergdahl,<sup>1</sup> Regnault,<sup>5</sup> Laby,<sup>1</sup> Morley,<sup>1</sup> Jewett,<sup>1</sup> Gebhardt,<sup>1</sup> Villiers,<sup>1</sup> van der Platts,<sup>1</sup> Menzies,<sup>2, 3a</sup> Bernhart,<sup>1</sup> Haber and Kerschbaum,<sup>1</sup> Caillietet, Colardeau, and Riviere,<sup>1</sup> Poindexter,<sup>1</sup> Eger-ton<sup>1, 2, 3</sup> Smith and Menzies,<sup>1</sup> Kahlbaum,<sup>1</sup> Heycock and Lamplough,<sup>1</sup> Hill,<sup>1</sup> Jenkins,<sup>3</sup> Rodebush and Dixon,<sup>2</sup> Ramsay and Young,<sup>3</sup> Callendar and Griffiths,<sup>1</sup> Pfaundler,<sup>1</sup> Scott,<sup>1</sup> Volmer and Eastman,<sup>1</sup> Volmer and Kirchoff,<sup>1</sup> and Young.<sup>1</sup> The vapor pressure data have been reviewed by Randall,<sup>2</sup> whose equation gives  $V = -14.60$ . The following are the directly measured values of the heat of vaporization of mercury at 623°:

Person,<sup>3, 4</sup> -12.4; Kurbatoff,<sup>1, 1a</sup> -13.6; Muscleeanii,<sup>1</sup> -12.77; Konowalow,<sup>2</sup> -15.5; Marignac,<sup>2</sup> -15.5. See also Beckmann and Liesche.<sup>1</sup>

The energy states of gaseous monatomic mercury are evaluated from the data of Fowler<sup>3</sup> and Paschen.<sup>9</sup> See also Carroll<sup>1</sup> and Valasek.<sup>1</sup>

**Hg (c).** The data on the heat of fusion of mercury are: Person,<sup>3, 4</sup> -0.60; Koref,<sup>1</sup> -0.57; Bridgman,<sup>5</sup> -0.54. See also Pollitzer,<sup>1</sup> Langlois,<sup>1</sup> Henning,<sup>3</sup> and Wilhelm.<sup>1, 1a</sup>

**Hg<sub>2</sub> (g).** Winans<sup>2</sup> reported  $D^\circ = -1.4$ .

**HgI<sub>2</sub> (c, red).** Varet<sup>1</sup> measured, at 12°, the heats of the reactions of Hg (liq.), HgI<sub>2</sub> (c), Hg<sub>2</sub>I<sub>2</sub> (c), Hg<sub>2</sub>Cl<sub>2</sub> (c), HgBr (c), Hg<sub>2</sub>SO<sub>4</sub> (c), Hg<sub>2</sub>(C<sub>2</sub>H<sub>3</sub>O<sub>2</sub>)<sub>2</sub> (c), and Hg<sub>2</sub>(NO<sub>3</sub>)<sub>2</sub> (aq.), respectively, with KI (aq.) or KI<sub>3</sub> (aq.). His various data yield the following values for HgI<sub>2</sub> (c, red):  $Q_f = 25.2, 25.3, 25.3, 25.3, 25.1, 25.4$ , and 25.2.

**HgI<sub>2</sub> (c, yellow).** For the heat of transition of mercuric iodide from the red to the yellow form, Bridgman<sup>6</sup> reported -0.547<sup>126</sup>; Schwartz,<sup>1</sup> -0.522<sup>127</sup>; Steiner and Johnston,<sup>1</sup> -0.64; Guinchaut,<sup>4</sup> -0.68<sup>130</sup>; Brockhorst,<sup>1</sup> -0.42 to -0.56. From the difference in the heats of solution, Berthelot<sup>84</sup> found  $T = -3.0$ .

**HgI<sub>2</sub> (liq.).** The data on the heat of fusion of HgI<sub>2</sub> (c, red) are: Guinchaut,<sup>4</sup> -4.45<sup>250</sup>; Beckmann,<sup>2</sup> -5.5; Rinse,<sup>1</sup> -4.9.

**HgI<sub>2</sub> (g).** Vapor pressure data on mercuric iodide were reported by Rinse,<sup>1</sup> Stelzner and Niederschulte,<sup>1</sup> Arctowski,<sup>1</sup> Johnson,<sup>1</sup> Ditte,<sup>11</sup> Prideaux,<sup>1</sup> and Schmidt and Walter.<sup>1</sup> These data were reviewed by Egerton and Edmondson,<sup>1</sup> and their values give -19.6 for the heat of sublimation at 256° and -15.0 for the heat of vaporization.

**Hg<sub>2</sub>I<sub>2</sub> (c, yellow).** Varet's data (see paragraph under HgI<sub>2</sub> (c, red)) yield, for this substance,  $Q_f = 28.87$ . The electromotive force data of Vosburgh<sup>2</sup> yield  $Q_f = 28.42$  and 28.93.

**HgI (g).** Vapor pressure data on Hg<sub>2</sub>I<sub>2</sub> were reported by Stelzner and Niederschulte,<sup>1</sup> whose data yield -6.4 to -5.8 for the heat of sublimation of 328 grams of mercurous iodide. According to the vapor density data, gaseous mercurous iodide is either HgI or Hg+HgI<sub>2</sub>. The heat of sublimation data indicate that the vapor is HgI. Spomer<sup>4</sup> estimated the energy of dissociation of HgI (g) to be about -19.

**HgI<sub>4</sub> (aq.).** Thomsen<sup>15</sup> measured the heat of solution of HgI<sub>2</sub> (c) in 2 KI(200) to be 3.48.

**HgBr<sub>2</sub> (c).** By direct measurement, Nernst<sup>6</sup> and Varet<sup>1</sup> obtained  $Q_f = 40.5$  and 40.70, respectively. Varet's<sup>1</sup> data on the reaction with aqueous KI yield  $Q_f = 40.70$ .

**HgBr<sub>2</sub> (liq.).** Beckmann<sup>1</sup> reported  $F = -4.5$ .<sup>236</sup>

**HgBr<sub>2</sub> (g).** Vapor pressure data were reported by Stelzner and Niederschulte,<sup>1</sup> Johnson,<sup>1</sup> Prideaux,<sup>1</sup> Arctowski,<sup>1</sup> and Jung and Ziegler.<sup>1</sup> Their data (see Egerton and Edmondson<sup>1</sup>) yield -19.1 for the heat of sublimation and -14.6 for the heat of vaporization.

**HgBr (g).** From spectroscopic data Jung and Ziegler<sup>1</sup> obtained values for the reaction,  $\text{HgBr}_2 (\text{g}) = \text{Br} (\text{g}) + \text{HgBr} (\text{g})$ , and for the energy

of excitation of  $\text{HgBr (g)}$ . The vapor pressure data of Jung and Ziegler<sup>1</sup> yield  $-19.6$  for the heat of sublimation of 281 grams of mercurous bromide. These authors believed the vapor to be  $\text{Hg} + \text{HgBr}_2$ , but it is more likely  $\text{HgBr}$ . Sponer<sup>4</sup> found from spectroscopic data a value for the energy of dissociation of  $\text{HgBr (g)}$  which yields, for this substance,  $Q_f = -16$ . Wieland<sup>1</sup> gave a value for the energy of excitation of  $\text{HgBr (g)}$ .

$\text{HgBr}_4^- \text{ (aq.)}$ . Thomsen<sup>15</sup> measured the heat of solution of  $\text{HgBr}_2 \text{ (c)}$  in 2  $\text{KBr (200)}$  to be 1.64; Berthelot<sup>84</sup> found 3.0<sup>11</sup> in 2  $\text{HBr (aq.)}$ .

$\text{HgBr}_2 \text{ (aq.)}$ . By working with dilute solutions, Berthelot<sup>84</sup> determined the true heat of solution of  $\text{HgBr}_2 \text{ (c)}$  to be  $-2.4$ .

$\text{Hg}_2\text{Cl}_2 \text{ (c)}$ . Gerke's<sup>1</sup> data on the cell in which the reaction was  $2 \text{ Hg (liq.)} + \text{Cl}_2 \text{ (g)} = \text{Hg}_2\text{Cl}_2 \text{ (c)}$  yield  $Q_f = 63.33$ . See also the data of Lewis and Randall<sup>1</sup> on the cell in which the reaction was  $\text{H}_2 \text{ (g)} + \frac{1}{2} \text{ Hg}_2\text{Cl}_2 \text{ (c)} = \text{HCl (555)} + \text{Hg (liq.)}$ , Ellis<sup>1</sup> and Harned and Brumbaugh's<sup>1</sup> data on the same reaction, and Rossini.<sup>10</sup> Varet's<sup>1</sup> data on the reactions of mercurous chloride with  $\text{KI (aq.)}$ , with  $\text{KI}_3 \text{ (aq.)}$ , and with  $\text{KNO}_3 \text{ (aq.)}$ , yield, for  $\text{Hg}_2\text{Cl}_2 \text{ (c)}$ ,  $Q_f = 62.65$ , 62.65, and 62.60. Brodsky's<sup>1</sup> electromotive force data on the cell reaction,  $\text{Hg}_2\text{Cl}_2 \text{ (c)} + 2 \text{ Br}^- \text{ (aq.)} = \text{Hg}_2\text{Br}_2 \text{ (c)} + 2 \text{ Cl}^- \text{ (aq.)}$ , yield  $Q_f = 62.78$ .

$\text{HgCl (g)}$ . The vapor pressure data of Maier,<sup>1</sup> Smith and Calvert,<sup>2</sup> von Richter,<sup>1</sup> and Stelzner and Niederschulte<sup>1</sup> yield  $-19.2$  for the heat of sublimation, but the value is not accurate. In order to be in accord with the spectroscopic data, the vapor of mercurous chloride must be  $\text{HgCl}$  and not  $2 \text{ Hg} + \text{Cl}_2$ . Sponer<sup>4</sup> found  $D^* = -32$  for  $\text{HgCl (g)}$  from spectroscopic data; whence, for the latter,  $Q_f = -12$ . Wieland<sup>1</sup> gave a value for the energy of excitation of  $\text{HgCl (g)}$ .

$\text{HgCl}_2 \text{ (c)}$ . Thomsen<sup>15</sup> measured the heats of the reactions of 4  $\text{KCl (aq.)}$  with  $\text{Hg}_2\text{Cl}_2 \text{ (c)} + \text{Cl}_2 \text{ (g)}$ , and with  $\text{HgCl}_2 \text{ (c)}$ . His data yield, for the latter,  $Q_f = 53.4$ . See also Andrews.<sup>16</sup>

$\text{HgCl}_2 \text{ (g)}$ . The vapor pressure data of Richter,<sup>1</sup> Prideaux,<sup>1</sup> Johnson,<sup>1</sup> Stelzner and Niederschulte,<sup>1</sup> and Schmidt and Walker,<sup>1</sup> which show an abnormal trend, yield  $-14.6$  for the heat of vaporization, and  $-18.7$  for the heat of sublimation at the melting point. According to Wyneken<sup>1</sup> and Mitscherlich,<sup>1</sup> the vapor is little dissociated.

$\text{HgCl}_2 \text{ (liq.)}$ . From the foregoing, we have calculated  $F = -4.1$ .<sup>277</sup>

$\text{HgCl}_2 \text{ (aq.)}$ . Thomsen's<sup>15</sup> data on the reaction between  $\text{HgCl}_2 \text{ (aq.)}$  and 2  $\text{KI (aq.)}$  yield, for the former,  $Q_f = 50.8$ . Varet's<sup>1</sup> data leads to the same value.

The data on the heat of solution of  $\text{HgCl}_2 \text{ (c)}$  in water are: Thomsen,<sup>15</sup>  $-3.32_{300}$ ; Berthelot,<sup>7</sup>  $-3.1$ ; Berthelot,<sup>19</sup>  $-2.04$ ; Pickering,<sup>8</sup>  $-2.12_{300}$ . The value of Thomsen<sup>15</sup> yields, for  $\text{HgCl}_2 \text{ (aq.)}$ ,  $Q_f = 50.1$ .

$\text{HgO (c, yellow ppt.)}$ . Thomsen<sup>15</sup> measured the heats of reaction of 2  $\text{KOH (200)}$  with  $\text{HgCl}_2 \text{ (400)}$ ,  $\text{K}_2\text{HgCl}_4 \text{ (400)}$ , and  $\text{K}_2\text{HgBr}_4 \text{ (400)}$ , respectively, to be 8.10, 6.81, and  $-5.26$ ; whence, for  $\text{HgO (c, yellow ppt.)}$ ,  $Q_f = 20.00$ , 20.70, and 20.84. Berthelot<sup>55</sup> measured the heat of solution of

the yellow oxide in aqueous HCN to be 31.6, and in aqueous HCl to be 18.6; whence, for HgO (c, yellow),  $Q_f = 21.0$ .

**HgO (c, red).** Berthelot's<sup>55</sup> data yield  $Q = 30.8$  for the heat of solution of HgO (c, red) in aqueous HBr to form the solid HgBr<sub>2</sub>; whence, for HgO (c, red),  $Q_f = 21.3$ . Varet<sup>1</sup> found the same value for the heat of solution of red HgO as did Berthelot for the yellow form, and concluded that the heat of transformation was small; but such a method of comparison is inaccurate because it involves the assumption that the systematic errors in the work of the two experimenters were the same in value. The dissociation pressure data of Taylor and Hulett<sup>1</sup> yield, for HgO (c, red),  $Q_f = 21.6$ . The electromotive force data of Ishikawa and Kimura,<sup>1</sup> Fried,<sup>1</sup> and Brönsted<sup>5</sup> on the cell reaction, HgO (c, red) + H<sub>2</sub> (g) = H<sub>2</sub>O (liq.) + Hg (liq.), yield  $Q = 46.77$ , 46.88, and 46.65; whence, for HgO (c, red),  $Q_f = 21.60$ , 21.49 and 21.72, respectively. In differentiating between the red and yellow forms of mercuric oxide we imply not a difference in the crystalline species, but merely a difference in the heat contents, which may be due to the difference in the size of the crystals of the two forms.

**Hg<sub>2</sub>(NO<sub>3</sub>)<sub>2</sub> (aq.).** Thomsen<sup>15</sup> measured the heats of the reactions of aqueous mercurous nitrate with KCl (aq.), KBr (aq.), and KI (aq.); and his data yield, for Hg<sub>2</sub>(NO<sub>3</sub>)<sub>2</sub> (aq.),  $Q_f = 57.8$ , 58.3, and 57.9. See also Berthelot<sup>85</sup> and Nernst.<sup>6</sup>

**Hg<sub>2</sub>(NO<sub>3</sub>)<sub>2</sub> · 2 H<sub>2</sub>O (c).** Varet<sup>1</sup> measured the heat of solution of this substance in 2 HI (aq.) and in (3 HI + I<sub>2</sub>) (aq.) to be 32.8 and 63.9, respectively; whence, for the solid dihydrate,  $Q_f = 206.6$  and 206.4. Varet's<sup>1</sup> similar data on the solution of the dihydrate in aqueous KI, KBr, and KCl yield, for Hg<sub>2</sub>(NO<sub>3</sub>)<sub>2</sub> · 2 H<sub>2</sub>O (c), the mean value of  $Q_f = 207.9$ .

**HgF<sub>2</sub> · nNH<sub>3</sub> (c).** Biltz and Rahlfs<sup>2</sup> measured the dissociation pressures of the amines with 2, 4, and 5 NH<sub>3</sub>.

**HgX<sub>2</sub> · nHgO (c).** Andre<sup>1, 4</sup> measured the heats of solution of HgCl<sub>2</sub> · HgO (c), HgCl<sub>2</sub> · 2 HgO (c), HgCl<sub>2</sub> · 3 HgO (c), HgCl<sub>2</sub> · 4 HgO (c), HgBr<sub>2</sub> · HgO (c), HgBr<sub>2</sub> · 2 HgO (c), HgBr<sub>2</sub> · 3 HgO (c), and HgBr<sub>2</sub> · 4 HgO (c).

**HgS (c).** Thomsen<sup>15</sup> found  $Q = 46.10$  for the reaction between Na<sub>2</sub>S (200) and HgCl<sub>2</sub> (200); whence, for HgS (c, black),  $Q_f = 7.20$ . Berthelot<sup>14</sup> found  $Q = 29.6$  for the reaction of HgCl<sub>2</sub> (aq.) with H<sub>2</sub>S (aq.); whence, for HgS (c, black),  $Q_f = 10.7$ . Varet's<sup>1</sup> data on the reaction between HgO (c) and H<sub>2</sub>S (aq.) yield, for HgS (c, black),  $Q_f = 10.9$ . Varet<sup>1</sup> measured the heat of transformation, HgS (c, black) = HgS (c, red), to be 0.30. See also the equilibrium data of Pelabon,<sup>1</sup> Rinse,<sup>1</sup> and Jellinek and Zakowski.<sup>1</sup>

**Hg<sub>2</sub>(NO<sub>3</sub>)<sub>2</sub> · HNO<sub>3</sub> (aq.).** Varet<sup>1</sup> measured the heat of solution of Hg<sub>2</sub>(NO<sub>3</sub>)<sub>2</sub> · 2 H<sub>2</sub>O (c) in HNO<sub>3</sub> (aq.) to be -12.4.

**Hg<sub>2</sub>O (c).** Thomsen<sup>15</sup> measured the heat of the reaction of (Hg<sub>2</sub>(NO<sub>3</sub>)<sub>2</sub> + 1.079 HNO<sub>3</sub>) (aq.) with 3.079 NaOH (aq.), and his data yield, for Hg<sub>2</sub>O (c),  $Q_f = 21.67$ . Varet's<sup>1</sup> data on the reaction of mercurous

chloride with aqueous KOH yield, for  $\text{Hg}_2\text{O}$  (c),  $Q_f=21.7$ . Varet's<sup>1</sup> data on the heat of reaction of solid mercurous acetate with aqueous KOH yield, for  $\text{Hg}_2\text{O}$  (c),  $Q_f=21.4$ .

$\text{Hg}_2(\text{C}_2\text{H}_3\text{O}_2)_2$  (c). Varet<sup>1</sup> measured the heats of reaction of this substance with aqueous KI and aqueous  $\text{KI}_3$ , his data yielding, for solid mercurous acetate,  $Q_f=203.2$  and  $203.3$ .

$\text{HgH}$  (g). The values for the energy of dissociation and of excitation of gaseous  $\text{HgH}$  are taken from Bengtsson and Hulthen<sup>1</sup> and Hori.<sup>3</sup>

$\text{Hg}_2\text{SO}_4$  (c). Varet's<sup>1</sup> data on the reaction with KI (aq.),  $\text{KI}_3$  (aq.), and KOH (aq.) yield, for  $\text{Hg}_2\text{SO}_4$  (c),  $Q_f=176.37$ ,  $176.47$ , and  $176.85$ . The data of Henderson and Stegeman<sup>1</sup> on the cell reaction,  $\text{Pb}$  (c) +  $\text{Hg}_2\text{SO}_4$  (c) =  $\text{PbSO}_4$  (c) +  $2\text{Hg}$  (liq.), yield  $Q=42.14$ ; whence, for  $\text{Hg}_2\text{SO}_4$  (c),  $Q_f=176.36$ . See also Ishikawa.<sup>4</sup>

$\text{HgSO}_4$  (c). Varet<sup>1</sup> measured the heat of solution of this substance in  $2\text{HCl}$  (aq.), and his data yield, for  $\text{HgSO}_4$  (c),  $Q_f=165.7$ . Varet's<sup>1</sup> data on the reaction of mercuric sulfate with aqueous HCN yield, for  $\text{HgSO}_4$  (c),  $Q_f=166.7$ . Berthelot's<sup>83</sup> data on the heats of mixing  $\text{HgSO}_4$  with HCl (aq.), with NaCl (aq.), and with  $\text{H}_2\text{SO}_4$  (aq.) yield, for  $\text{HgSO}_4$  (c),  $Q_f=166.6$ .

$\text{HgSO}_4 \cdot 4\text{H}_2\text{SO}_4$  (aq.). Varet<sup>1</sup> measured the heat of solution of  $\text{HgSO}_4$  (c) in  $4\text{H}_2\text{SO}_4$  (100) to be  $4.4$ .

$(\text{HgO})_3\text{SO}_3$  (c). Varet<sup>1</sup> measured the heat of solution of this substance in  $6\text{HCl}$  (aq.) and  $25\text{H}_2\text{SO}_4$  (aq.) to be  $43.4$  and  $9.1$ , respectively.

$\text{HgSe}$  (c). Fabre<sup>2</sup> found the heat of solution of mercuric selenide in bromine water to be  $76.1$ , and the heat of mixing  $\text{HgCl}_2$  (500) with  $\text{Na}_2\text{Se}$  (500) to be  $70.4$ ; whence, for  $\text{HgSe}$  (c),  $Q_f=3.5$  and  $8.0$ , respectively.

$\text{Hg}_2\text{N}_6$  (c). Berthelot and Vieille<sup>10</sup> found the heat of decomposition of mercury azide to be  $143.5$ ; Wohler and Martin<sup>1</sup> found  $100.0$ .

$\text{Hg}(\text{NO}_3)_2$  (aq.). Thomsen's<sup>15</sup> data on the reaction of  $\text{HgO}$  (c) with  $\text{HNO}_3$  (aq.) yield, for  $\text{Hg}(\text{NO}_3)_2$  (aq.),  $Q_f=57.0$ . Varet's<sup>1</sup> data on the heat of solution of the hemihydrate in aqueous HCl and in aqueous  $\text{HNO}_3$  yield, for  $\text{Hg}(\text{NO}_3)_2$  (aq.),  $Q_f=56.2$ .

$\text{Hg}(\text{NO}_3)_2 \cdot \frac{1}{2}\text{H}_2\text{O}$  (c). Varet<sup>1</sup> measured the heat of solution of the hemihydrate in HCl (aq.), in KCN (aq.), and in  $\text{HNO}_3$  (aq.) to be  $4.62$ ,  $24.0$ , and  $-1.4$ , respectively.

$\text{Hg}(\text{NO}_3)_2 \cdot 2\text{HgO} \cdot \text{H}_2\text{O}$  (c). Varet<sup>1</sup> measured the heat of solution of this substance in  $\text{HNO}_3$  (aq.) and in KCN (aq.) to be  $3.8$  and  $77.6$ , respectively.

$(\text{Hg}_2\text{N})_2\text{O}$  (c). We have here formally considered all the mercury nitrogen compounds derived from Millon's base,  $\text{Hg}_2\text{NH}_5\text{O}_3$ , to be derivatives of the oxide  $(\text{Hg}_2\text{N})_2\text{O}$ , where the group  $\text{Hg}_2\text{N}$  has an ordinary valence of plus one. The thermochemistry of these compounds has been studied by Gaudechon,<sup>1</sup> who measured the heats of solution of the derivatives and of  $\text{HgO}$  in aqueous KCN. For the oxide  $(\text{Hg}_2\text{N})_2\text{O}$  (c), Gaudechon<sup>1</sup> measured the heat of solution in KCN (aq.) to be  $151.0$ , and

for  $\text{HgO}$  (c) in  $\text{KCN}$  (aq.) to be 154.6; whence, for  $(\text{Hg}_2\text{N})_2\text{O}$  (c),  $Qf = -77.0$ .

$(\text{Hg}_2\text{N})_2\text{O}$  (aq.). Gaudechon<sup>1</sup> measured the heat of solution of the solid.

$\text{Hg}_2\text{NOH} \cdot n\text{H}_2\text{O}$  (c). Gaudechon<sup>1, 2</sup> measured the heats of solution, in aqueous  $\text{KCN}$ , of  $\text{Hg}_2\text{NOH}$  (c) and of the hydrates with  $1\frac{1}{2}$ , 2, and 4  $\text{H}_2\text{O}$ .

$\text{Hg}_2\text{NCl} \cdot n\text{H}_2\text{O}$  (c). Gaudechon<sup>1, 2</sup> measured the heats of solution, in aqueous  $\text{KCN}$ , of the hemi- and monohydrates.

$\text{Hg}_2\text{NCl} \cdot n\text{NH}_4\text{Cl}$  (c). Gaudechon<sup>1, 2</sup> measured the heat of solution, in aqueous  $\text{KCN}$ , of  $\text{Hg}_2\text{NCl} \cdot \text{NH}_4\text{Cl}$  (c) and of  $\text{Hg}_2\text{NCl} \cdot 3\text{NH}_4\text{Cl}$  (c).

$\text{Hg}_2\text{NCl} \cdot n\text{NH}_3$  (c). Gaudechon<sup>1, 2</sup> measured the heats of solution of the ammines with  $\frac{1}{2}$  and 1  $\text{NH}_3$ .

$\text{Hg}_2\text{NCl} \cdot \frac{1}{2}\text{HgCl}_2$  (c). Gaudechon<sup>1</sup> measured the heat of solution in aqueous  $\text{KCN}$ .

$\text{Hg}_2\text{NBr}$  (c). Gaudechon<sup>1</sup> measured the heat of solution in aqueous  $\text{KCN}$ .

$\text{Hg}_2\text{NBr} \cdot n\text{HgBr}_2$  (c). Gaudechon<sup>1</sup> measured the heats of solution, in aqueous  $\text{KCN}$ , of these compounds with  $n = \frac{1}{4}$ ,  $\frac{1}{2}$ , 1, and 3.

$\text{HgCl}_2 \cdot n\text{NH}_3$  (c). Biltz, Klatte, and Rahlfs<sup>1</sup> measured the heat of solution of mercuric chloride and of the diammine in aqueous  $\text{HCl}$  to be  $-1.5$  and  $34.5$ , respectively. Biltz and Mau<sup>1</sup> measured the heat of solution of the diammine in water to be  $10.2$ . Biltz and Mau<sup>1</sup> obtained dissociation pressure data on the ammines with 8 and  $8\frac{1}{2}$   $\text{NH}_3$ .

$\text{HgBr}_2 \cdot n\text{NH}_3$  (c). Biltz, Klatte, and Rahlfs<sup>1</sup> obtained dissociation pressure data on the octammine, and measured the heat of solution of the diammine in aqueous (20 per cent)  $\text{KCN}$ .

$\text{HgI}_2 \cdot n\text{NH}_3$  (c). Biltz, Klatte, and Rahlfs<sup>1</sup> measured the dissociation pressures of the di- and octammines, and measured the heat of solution of the diammine in aqueous (20 per cent)  $\text{KCN}$ . For the dissociation,  $\text{HgI}_2 \cdot 2\text{NH}_3$  (c) =  $\text{HgI} \cdot \frac{3}{4}\text{NH}_3$  (c) +  $1\frac{1}{4}\text{NH}_3$  (g), the data of these authors give  $Q = 1\frac{1}{4}(-13.1)$ .

$\text{HgF}_2 \cdot n\text{NH}_3$  (c). Biltz and Rahlfs<sup>2</sup> measured the dissociation pressures of the di-, tetra-, and pentammines.

$\text{HgBr}_2 \cdot 2\text{NH}_4\text{Br}$  (aq.). Varet's<sup>6</sup> data on the heat of mixing yield  $Qf = 160.8$ . We have computed, from the ions,  $Qf = 162.3$ .

$\text{Hg}_2\text{Cl}_2 \cdot 2\text{NH}_3$  (c). Bonnefoi<sup>1</sup> calculated the heat of dissociation from the data of Isambert.<sup>1</sup>

$\text{Hg}_2\text{SO}_4 \cdot n\text{NH}_3$  (c). Ephraim<sup>8</sup> measured the dissociation pressures of these ammines, but the data can not be used because of uncertainty as to the products of dissociation.

$\text{HgC}_2\text{O}_4$  (c). Berthelot<sup>90</sup> measured the heat of solution of mercuric oxalate in 4  $\text{HCl}$  (100).

$\text{Hg}_2(\text{C}_2\text{H}_3\text{O}_2)_2$  (c). Varet<sup>1</sup> found the heat of solution of mercurous acetate in  $\text{KI}$  (aq.) and in  $\text{KI}_3$  (aq.) to be  $36.6$  and  $67.5$ ; whence, for  $\text{Hg}_2(\text{C}_2\text{H}_3\text{O}_2)_2$  (c),  $Qf = 203.16$  and  $203.36$ , respectively.

$\text{Hg}(\text{C}_2\text{H}_3\text{O}_2)_2$  (aq.). Berthelot<sup>90</sup> measured the heat of reaction of aqueous mercuric acetate with  $\text{HCl}$  (aq.), with aqueous acetic acid, and with  $\text{KOH}$  (aq.), respectively.

$\text{Hg}(\text{C}_2\text{H}_3\text{O}_2)_2$  (c). Berthelot<sup>90</sup> measured the heat of solution.

$\text{HgCl}_2 \cdot \text{CH}_3\text{OH}$  (c). Lloyd, Brown, Bunnell, and Jones<sup>1</sup> measured the dissociation pressures.

$\text{Hg}(\text{CN})_2$  (aq.). Thomsen<sup>15</sup> found the heats of the reaction of  $\text{HgCl}_2$  (400) with 4  $\text{KCN}$  (100), and of  $\text{K}_2\text{Hg}(\text{CN})_4$  (aq.) with  $\text{HgCl}_2$  (400), to be 45.6 and 22.0, respectively; whence, for  $\text{Hg}(\text{CN})_2$  (aq.),  $Q_f = -64.8$ . Varet<sup>1</sup> measured the heat of solution of  $\text{HgSO}_4$  (c) in 2  $\text{HCN}$  (250) to be 28.33, and of  $\text{HgO}$  (c, red) in 2  $\text{HCN}$  (aq.) to be 31.6. Berthelot<sup>87</sup> measured the heat of the latter reaction to be 31.0<sup>15</sup>.

$\text{Hg}(\text{CN})_2$  (c). Thomsen's<sup>15</sup> data yield  $-2.97$  for the heat of solution; Berthelot<sup>7</sup> found  $-3.0$ .

$\text{Hg}(\text{CN})_4^{--}$  (aq.). Berthelot<sup>87</sup> measured the heats of mixing  $\text{Hg}(\text{CN})_2$  (aq.) with 2  $\text{KCN}$  (aq.), and of  $\text{K}_2\text{Hg}(\text{CN})_4$  (aq.) with 2  $\text{HCl}$  (aq.).

$\text{Hg}(\text{CN})_2 \cdot n\text{HgO}$  (c). Joannis<sup>1</sup> measured the heats of solution, in aqueous  $\text{HCl}$ , of these compounds with  $n = \frac{1}{2}$  and 1.

$\text{Hg}(\text{CN})_2 \cdot n\text{NH}_4\text{CN}$  (aq.). Varet<sup>1</sup> measured the heat of mixing  $\text{Hg}(\text{CN})_2$  (aq.) with 1 and 2 moles of  $\text{NH}_4\text{CN}$  (aq.), respectively.

$\text{Hg}(\text{CN})_2 \cdot \text{NH}_4\text{X}$  (aq.). Varet<sup>2</sup> measured the heat of mixing  $\text{Hg}(\text{CN})_2$  (aq.) with  $\text{NH}_4\text{Cl}$  (aq.),  $\text{NH}_4\text{Br}$  (aq.), and  $\text{NH}_4\text{I}$  (aq.), respectively.

$\text{Hg}(\text{CN})_2 \cdot \text{NH}_4\text{X} \cdot n\text{H}_2\text{O}$  (c). Varet<sup>2</sup> measured the heats of solution of  $\text{Hg}(\text{CN})_2 \cdot \text{NH}_4\text{Cl} \cdot \frac{3}{4}\text{H}_2\text{O}$  (c), of  $\text{Hg}(\text{CN})_2 \cdot \text{NH}_4\text{Br} \cdot \text{H}_2\text{O}$  (c), and of  $\text{Hg}(\text{CN})_2 \cdot \text{NH}_4\text{I} \cdot \frac{1}{4}\text{H}_2\text{O}$  (c).

$\text{Hg}(\text{ONC})_2$  (c). Kast and Selle<sup>1</sup> measured the heat of decomposition of mercuric fulminate to be 117.7. See also Berthelot and Vieille.<sup>1</sup>

$\text{Hg}(\text{CNS})_2$  (c). Joannis<sup>1</sup> measured the heat of reaction of  $\text{HgCl}_2$  (aq.) with 2  $\text{KCNS}$  (aq.) to be 14.6.

$\text{Hg}_{100}\text{Bi}$  (liq.). Tammann and Ohler<sup>1</sup> determined the heat of formation of this amalgam.

$\text{Hg}_n\text{Sn}$  (liq.). The values for  $\text{Hg}_{50}\text{Sn}$  (liq.) and  $\text{Hg}_{100}\text{Sn}$  (liq.) are from van Heteren,<sup>1</sup> Richards and Wilson,<sup>1</sup> and Tammann and Ohler.<sup>1</sup>

$\text{Hg}_n\text{Pb}$  (liq.). The values for these amalgams, with  $n = 100, 260$ , and 1000, are from Richards and Garrod-Thomas<sup>1</sup> and Tammann and Ohler.<sup>1</sup>

$\text{HgPb}_2$  (c). The value for this amalgam is obtained from the data of Gerke,<sup>1</sup> Brönsted,<sup>1, 4</sup> and Henderson and Stegeman.<sup>1</sup>

$\text{Hg}_5\text{Tl}_2$  (c). The data of Biltz and Meyer<sup>2</sup> yield  $Q_f = 2.5$  for this amalgam.

$\text{Hg}_n\text{Tl}$  (liq.). The values for the liquid thallium amalgams are from Richards and Daniels<sup>1</sup> and Richards and Smith.<sup>2</sup>

$\text{Hg}_m\text{In}_n$ . See Richards and Wilson.<sup>1</sup>

$\text{Hg}_m\text{Zn}_n$  (liq.). The values for the liquid zinc amalgams are from Richards and Lewis,<sup>1</sup> Richards and Wilson,<sup>1</sup> Favre,<sup>1, 2</sup> Taylor,<sup>3</sup> and Pearce and Eversole.<sup>1</sup>

$\text{Hg}_m\text{Cd}_n$  (c),  $\text{Hg}_m\text{Cd}$  (liq.). The values for the liquid and solid cadmium amalgams are from Richards and Garrod-Thomas,<sup>1</sup> Biji,<sup>1</sup> Richards and Forbes,<sup>1</sup> Cohen,<sup>5</sup> Carhart,<sup>1</sup> Richards and Lewis,<sup>1,2</sup> Richards, Frevert, and Teeter,<sup>1</sup> Hulett,<sup>1</sup> Tammann and Ohler,<sup>1</sup> Richards and Wilson,<sup>1</sup> Getman,<sup>1</sup> and Hildebrand, Foster, and Beebe.<sup>1</sup>

$\text{HgBr}_2 \cdot n\text{ZnBr}_2$  (aq.). Varet<sup>2,6</sup> measured the heat of mixing  $\text{HgBr}_2$  (aq.) with  $\frac{1}{2}$ , 1, and 2 moles of  $\text{ZnBr}_2$  (aq.).

$\text{Hg}(\text{CN})_2 \cdot \text{ZnCl}_2$  (aq.). Varet<sup>2,6</sup> measured the heat of mixing.

$\text{Hg}(\text{CN})_2 \cdot \text{ZnCl}_2 \cdot 7\text{H}_2\text{O}$  (c). Varet<sup>2,6</sup> measured the heat of solution.

$\text{Hg}(\text{CN})_2 \cdot \text{ZnBr}_2$  (aq.). Varet<sup>2,6</sup> measured the heat of mixing.

$\text{Hg}(\text{CN})_2 \cdot \text{ZnBr}_2 \cdot 8\text{H}_2\text{O}$  (c). Varet<sup>2,6</sup> measured the heat of solution.

$\text{HgBr}_2 \cdot n\text{CdBr}_2$  (aq.). Varet<sup>2,6</sup> measured the heat of mixing  $\text{HgBr}_2$  (aq.) with  $\frac{1}{2}$ , 1, and 2 moles of  $\text{CdBr}_2$  (aq.).

$\text{Hg}(\text{CN})_2 \cdot n\text{CdX}_2$  (aq.). Varet measured the heat of mixing  $\text{Hg}(\text{CN})_2$  (aq.) with 1 mole of  $\text{CdCl}_2$  (aq.), with  $\frac{1}{2}$  and 1 mole of  $\text{CdBr}_2$  (aq.), and with  $\frac{1}{2}$  mole of  $\text{CdI}_2$  (aq.).

$n\text{Hg}(\text{CN})_2 \cdot \text{CdX}_2 \cdot m\text{H}_2\text{O}$  (c). Varet<sup>2,6</sup> measured the heats of solution of  $\text{Hg}(\text{CN})_2 \cdot \text{CdCl}_2 \cdot 2\text{H}_2\text{O}$  (c),  $\text{Hg}(\text{CN})_2 \cdot \text{CdBr}_2 \cdot 3\text{H}_2\text{O}$  (c), and  $2\text{Hg}(\text{CN})_2 \cdot \text{CdI}_2 \cdot 8\text{H}_2\text{O}$  (c).

#### COPPER

$\text{Cu}$  (c). Standard state.

$\text{Cu}$  (liq.). Data on the heat of fusion of copper at its melting point, 1083°, were reported by the following: Umino,<sup>3</sup> -3.21; Glaser,<sup>1</sup> -2.65; Richards,<sup>1a</sup> -2.70; Wust, Meuthen, and Durrer<sup>1</sup> (recalculated by Randall, Nielsen, and West<sup>1</sup>), -3.24. See also Honda and Ishigaki.<sup>1</sup> These data were reviewed by Randall, Nielsen, and West.<sup>1</sup>

$\text{Cu}$  (g). Vapor pressure data were reported by Fery,<sup>1</sup> Greenwood,<sup>3,4,5,7</sup> Harteck,<sup>1</sup> Jones, Langmuir, and Mackay,<sup>1</sup> Ruff and Bergdahl,<sup>1</sup> Ruff and Konschak,<sup>1</sup> and Ruff and Mugdan.<sup>1</sup> From these data Randall, Nielsen, and West<sup>1</sup> computed the heat of sublimation at 25° to be -90.4. This value is much higher than those calculated from the same data by van Laar,<sup>1</sup> van Liempt,<sup>1</sup> Sherman,<sup>1</sup> and us; and is not in agreement with the calculations of Langmuir and Mackay,<sup>1</sup> and the measurements of Rosenhain and Ewen.<sup>1</sup> The measurements of Jones, Langmuir, and Mackay<sup>1</sup> lead to the value -82.0. We have selected Sherman's<sup>1</sup> value of -81.2.

The energy states of gaseous monatomic copper have been evaluated from the following: Fowler,<sup>3</sup> Shenstone,<sup>1a</sup> Kichlu,<sup>1</sup> Bacher and Goudsmit,<sup>1</sup> Krueger,<sup>2</sup> Lang,<sup>1a</sup> and Wahlin.<sup>2</sup>

$\text{Cu}_2\text{O}$  (c). Maier's<sup>1a</sup> equilibrium data on the reaction,  $\text{Cu}_2\text{O}$  (c) +  $\text{H}_2$  (g) = 2  $\text{Cu}$  (c) +  $\text{H}_2\text{O}$  (g), yield  $Q=16.45$ ; whence, for  $\text{Cu}_2\text{O}$  (c),  $Q_f=41.35$ . Maier's<sup>4</sup> electromotive force data on the cell reaction,  $\text{Cu}_2\text{O}$  (c) +  $\text{H}_2$  (g) = 2  $\text{Cu}$  (c) +  $\text{H}_2\text{O}$  (liq.), yield  $Q=27.45$ ; whence, for  $\text{Cu}_2\text{O}$  (c),  $Q_f=40.92$ . From the data on entropies and free energies of the substances in the foregoing reaction, Millar<sup>5</sup> computed, for  $\text{Cu}_2\text{O}$  (c),  $Q_f=40.64$ .

Thomsen<sup>15</sup> found  $Q = 15.16$  for the reaction,  $\text{Cu}_2\text{O} (\text{c}) + \text{H}_2\text{SO}_4(100) = \text{Cu} (\text{c}) + \text{CuSO}_4(100) + \text{H}_2\text{O} (\text{liq.})$ ; whence, for  $\text{Cu}_2\text{O} (\text{c})$ ,  $Q_f = 42.5$ . See also Wohler and Balz,<sup>2</sup> Allmand,<sup>1, 1a</sup> Ishikawa and Kimura,<sup>1</sup> Nielsen and Brown,<sup>1</sup> Andrews,<sup>14</sup> and Dulong.<sup>2</sup>

**$\text{Cu}_2\text{O} (\text{liq.})$ .** Randall, Nielsen, and West<sup>1</sup> calculated the heat of fusion of cuprous oxide.

**$\text{CuO} (\text{c})$ .** The data of von Wartenberg and Werth<sup>1</sup> yield for the reaction,  $\text{CuO} (\text{c}) + \text{H}_2 (\text{g}) = \text{Cu} (\text{c}) + \text{H}_2\text{O} (\text{liq.})$ ,  $Q = 38.3$ ; whence, for  $\text{CuO} (\text{c})$ ,  $Q_f = 38.5$ . The values reported by Andrews<sup>14</sup> and Dulong<sup>2</sup> nearly 100 years ago were 38.4 and 39.4, respectively. Randall, Nielsen, and West<sup>1</sup> reviewed the equilibrium data of Smyth and Roberts,<sup>1</sup> Roberts and Smyth,<sup>1</sup> Foote and Smith,<sup>1</sup> Wohler and Foss,<sup>1</sup> Wohler and Balz,<sup>2</sup> Moles and Paya,<sup>1</sup> and Ruer and Nakamota,<sup>1</sup> and concluded that, for  $\text{CuO} (\text{c})$ ,  $Q_f = 34.4$ . Maier's<sup>4</sup> electromotive force data on the cell reaction,  $\text{Cu}_2\text{O} (\text{c}) + \text{H}_2\text{O} (\text{liq.}) = 2 \text{CuO} (\text{c}) + \text{H}_2 (\text{g})$ , yield  $Q = -30.0$ ; whence, for  $\text{CuO} (\text{c})$ ,  $Q_f = 38.4$ . See also Biltz,<sup>8</sup> Smyth and Roberts,<sup>1</sup> Brody and Mullner,<sup>1</sup> Halla,<sup>1</sup> Treadwell,<sup>1</sup> and Bernoulli.<sup>1</sup>

**$\text{CuO} (\text{liq.})$ .** From the foregoing data on equilibria involving both solid and liquid  $\text{CuO}$ , we have computed the heat of fusion to be  $-13.3^{1336}$ .

**$\text{CuSO}_4 (\text{aq.})$ .** Thomsen's<sup>15</sup> data on the heat of solution of  $\text{CuO}$  in aqueous  $\text{H}_2\text{SO}_4$  yield, for  $\text{CuSO}_4(400)$ ,  $Q_f = 200.8$ . For the heat of the reaction,  $\text{CuSO}_4(400) + \text{Fe} (\text{c}) = \text{FeSO}_4(400) + \text{Cu} (\text{c})$ , Thomsen<sup>15</sup> found  $Q = 37.24$ ; whence, for  $\text{CuSO}_4(400)$ ,  $Q_f = 198.7$ . Data on the heat of dilution were reported by Thomsen,<sup>15</sup> Perreu,<sup>2</sup> and Arrhenius.<sup>2</sup>

**$\text{CuSO}_4 (\text{c})$ .** The data on the heat of solution are: Thomsen,<sup>15</sup>  $15.80_{800}$ ; Donnan and Hope,<sup>1</sup>  $15.7$ ; Pickering,<sup>7</sup>  $15.92_{400}$ ; Schottky,<sup>1</sup>  $15.93_{400}$ .

**$\text{CuSO}_4 \cdot \text{H}_2\text{O} (\text{c})$ .** The data on the heat of solution are: Thomsen,<sup>15</sup>  $9.32_{400}$ ; Donnan and Hope,<sup>1</sup>  $10.1$ ; Jorissen<sup>2</sup> (see Thomsen<sup>15</sup>),  $9.33$ ; Pickering,<sup>7</sup>  $8.90_{400}$ ; Schottky,<sup>1</sup>  $9.33_{400}$ . See also Siggel.<sup>1</sup> Vapor pressure data on the system  $\text{CuSO}_4 \cdot \text{H}_2\text{O} (\text{c}) - \text{CuSO}_4 (\text{c}) - \text{H}_2\text{O} (\text{g})$  were reported by Lescoeur,<sup>4</sup> Siggel,<sup>1</sup> Schottky,<sup>1</sup> and Foote and Scholes.<sup>1</sup>

**$\text{CuSO}_4 \cdot 3 \text{H}_2\text{O} (\text{c})$ .** The data on the heat of solution are: Thomsen,<sup>15</sup>  $2.84_{400}$ ; Jorissen<sup>2</sup> (see Thomsen<sup>15</sup>),  $3.08$ ; Partington and Huntingford,<sup>1</sup>  $3.46$ ; Donnan and Hope,<sup>1</sup>  $3.20$ . Vapor pressure data on the system  $\text{CuSO}_4 \cdot 3 \text{H}_2\text{O} (\text{c}) - \text{CuSO}_4 \cdot \text{H}_2\text{O} (\text{c}) - \text{H}_2\text{O} (\text{g})$  were reported by Lescoeur,<sup>4</sup> Frowein,<sup>1</sup> and Carpenter and Jette.<sup>1</sup> These data were reviewed by Randall, Nielsen, and West.<sup>1</sup>

**$\text{CuSO}_4 \cdot 5 \text{H}_2\text{O} (\text{c})$ .** The data on the heat of solution are: Donnan and Hope,<sup>1</sup>  $-3.3$ ; Favre,<sup>8</sup>  $-3.17^{19}$ ; Pickering,  $-2.80_{800}$ ; Scholz,  $-3.4_{400}^0$ . See also Favre and Valson<sup>1</sup> and Perreu.<sup>1</sup> Vapor pressure data on the system  $\text{CuSO}_4 \cdot 5 \text{H}_2\text{O} (\text{c}) - \text{CuSO}_4 \cdot 3 \text{H}_2\text{O} (\text{c}) - \text{H}_2\text{O} (\text{g})$  were reported by Lescoeur,<sup>4</sup> Carpenter and Jette,<sup>1</sup> Frowein,<sup>1</sup> Hollman,<sup>1</sup> Wilson,<sup>2</sup> Noyes and Westbrook,<sup>1</sup> Foote and Scholes,<sup>1</sup> Linebarger,<sup>1</sup> Partington,<sup>1</sup> Partington and Huntingford,<sup>1</sup> and Schumb.<sup>1</sup> These data were reviewed by Randall, Nielsen, and West.<sup>1</sup> The electromotive force data of Oholm<sup>1</sup> and Obata<sup>1</sup>

on the cell reaction,  $\text{Cu (c)} + \text{Hg}_2\text{SO}_4 \text{ (c)} + 5 \text{H}_2\text{O (satd. soln. of CuSO}_4\text{)} = \text{CuSO}_4 \cdot 5 \text{H}_2\text{O (c)} + \text{Hg (liq.)}$ , yield  $Q = 24.86$  and  $24.71$ , respectively. The average yields, for  $\text{CuSO}_4 \cdot 5 \text{H}_2\text{O (c)}$ ,  $Q_f = 545.34$ . See also Cohen, Chattaway, and Tombrock,<sup>1</sup> Nielsen and Brown,<sup>1</sup> Bedeau,<sup>1</sup> and Burian.<sup>1</sup>

**CuCl (c).** Thomsen<sup>15</sup> measured the heat of reaction of cuprous oxide with  $2 \text{HCl (aq.)}$  to be  $14.66$ ; whence, for  $\text{CuCl (c)}$ ,  $Q_f = 33.8$ . Noyes and Chow<sup>1</sup> found  $Q = 9.81$  for the reaction,  $3 \text{CuCl (c)} + 1\frac{1}{2} \text{Sn (c)} = 1\frac{1}{2} \text{SnCl}_2 \text{ (aq.)} + 3 \text{Cu (c)}$ ; whence, for  $\text{CuCl (c)}$ ,  $Q_f = 37.15$ . The electromotive force data of Noyes and Chow<sup>1</sup> on the cell reaction,  $1\frac{1}{2} \text{H}_2 \text{ (g)} + 3 \text{CuCl (c)} = 3 \text{Cu (c)} + 3 \text{HCl (aq.)}$ , yield  $Q = 21.57$ ; whence, for  $\text{CuCl (c)}$ ,  $Q_f = 32.3$ . From equilibrium data on the reaction between cuprous chloride and hydrogen, Watanabe<sup>1a, 2</sup> calculated, for  $\text{CuCl (c)}$ ,  $Q_f = 32.6$ . Bodlander and Storbeck<sup>1</sup> estimated  $Q_f = 32.9$ . See also Parravano and Malquorri.<sup>3</sup> Thomsen's<sup>15</sup> data on the reaction of cuprous chloride with  $\text{KMnO}_4 \text{ (aq.)}$  yield, for  $\text{CuCl (c)}$ ,  $Q_f = 34.2$ . Berthelot's<sup>59</sup> data on the reaction of cuprous chloride with hydrogen peroxide yield, for  $\text{CuCl (c)}$ ,  $Q_f = 37.1$ . The data of Edgar and Cannon<sup>1</sup> on the equilibrium,  $\text{CuCl (c)} + \text{AgCl (c)} = \text{CuCl}_2 \text{ (aq.)} + \text{Ag (c)}$ , yield, for  $\text{CuCl (c)}$ ,  $Q_f = 32.0$ . Sievert and Gotta's<sup>1</sup> data on the reaction,  $\text{Cu (c)} + \text{CuCl}_2 \text{ (aq.)} = 2 \text{CuCl (c)}$ , yield  $Q = 3.80$ ; whence, for  $\text{CuCl (c)}$ ,  $Q_f = 33.9$ .

**CuCl (aq. HCl).** Noyes and Chow<sup>1</sup> found the heat of solution of  $\text{CuCl}$  in  $\text{HCl(500)}$  to be  $-6.44$ ; Berthelot<sup>59</sup> found values ranging from  $-0.8^{14}$  for  $\text{HCl(5)}$  to  $9.5^{14}$  for  $\text{HCl(60)}$ .

**Cu<sub>2</sub>Cl<sub>2</sub> (liq.).** Watanabe<sup>1a, 2</sup> reported  $F = -7.74^{430}$ .

**Cu<sub>2</sub>Cl<sub>2</sub> (g).** The vapor pressure data of von Wartenberg and Bosse<sup>1</sup> yield  $-19.2$  for the heat of vaporization. The vapor of cuprous chloride is  $\text{Cu}_2\text{Cl}_2$ .

**CuCl<sub>2</sub> (aq.).** Thomsen's<sup>15</sup> data on the reactions,  $\text{CuCl}_2(200) + \text{H}_2\text{SO}_4(200) = \text{CuSO}_4(200) + 2 \text{HCl}(200)$  and  $\text{CuSO}_4(400) + \text{BaCl}_2(400) = \text{CuCl}_2(800) + \text{BaSO}_4 \text{ (c)}$ , yield, for  $\text{CuCl}_2(200)$ ,  $Q_f = 64.0$ . Data on the heat of dilution of aqueous cupric chloride were reported by Thomsen,<sup>15</sup> Reicher and van Deventer,<sup>2</sup> Berthelot,<sup>5</sup> and Partington and Soper.<sup>1</sup>

**CuCl<sub>2</sub> (c).** The data on the heat of solution are: Favre and Silbermann,<sup>3</sup>  $9.9$ ; Sabatier,<sup>2</sup>  $11.2_{400}^{20}$ ; Partington and Soper,<sup>1</sup>  $16.30_{200}^{25}$ ; Agostini,<sup>1</sup>  $11.08_{600}$ ; Thomsen,<sup>15</sup>  $11.12_{600}$ .

**CuCl<sub>2</sub> · 2 H<sub>2</sub>O (c).** The data on the heat of solution are: van Deventer and van der Stadt,<sup>1</sup>  $3.71_{200}$ ; Thomsen,<sup>15</sup>  $4.21_{400}$ ; Biltz, Broham, and Wein,<sup>1</sup>  $6.3$ , in  $\text{HCl(20)}$ .

**CuCl<sub>2</sub> · 3 CuO · nH<sub>2</sub>O (c).** Berthelot<sup>77</sup> measured the heats of solution in aqueous  $\text{HCl}$  of the anhydrous salt and the tetrahydrate.

**CuO · CuCl<sub>2</sub> (c).** Korveze,<sup>1</sup> from equilibrium data, reported  $Q = 29.05$  for the reaction,  $2 \text{CuCl}_2 \text{ (c)} + \frac{1}{2} \text{O}_2 \text{ (g)} = \text{Cl}_2 \text{ (g)} + \text{CuO} \cdot \text{CuCl}_2 \text{ (c)}$ .

**CuCl<sub>2</sub>(C<sub>2</sub>H<sub>5</sub>OH).** Partington and Soper<sup>1</sup> measured the heat of solution of cupric chloride in various amounts of ethyl alcohol.

**CuH (g).** The energy of dissociation and of excitation of gaseous  $\text{CuH}$  are taken from the work of Bengtsson and Hulthen.<sup>1</sup>

**Cu(OH)<sub>2</sub> (c).** Sabatier<sup>9</sup> and de Forcrand<sup>63</sup> measured the heats of solution of both the blue and the green forms of solid cupric hydroxide in aqueous nitric acid. Thomsen<sup>15</sup> measured the heat of reaction of KOH (aq.) with CuSO<sub>4</sub> (aq.), and of Ba(OH)<sub>2</sub> (aq.) with CuSO<sub>4</sub> (aq.). See also Bouzat.<sup>1</sup>

**3 CuO · H<sub>2</sub>O (c).** Sabatier<sup>9</sup> and de Forcrand<sup>63</sup> measured the heat of solution in aqueous nitric acid.

**CuF<sub>2</sub> (aq.).** Petersen<sup>3</sup> measured the heat of reaction of CuCl<sub>2</sub>(300) with 2 AgF to be 31.88.

**Cu(ClO<sub>3</sub>)<sub>2</sub> (aq.).** Thomsen<sup>15</sup> measured the heat of reaction of CuSO<sub>4</sub> (200) with Ba(ClO<sub>3</sub>)<sub>2</sub>(200) to be 4.37.

**Cu(ClO<sub>4</sub>)<sub>2</sub> (aq.).** The value for this substance has been computed from those for the ions.

**CuClO<sub>4</sub> (aq.).** Heinerth<sup>1</sup> reported  $Q = -18.80$  for the reaction, Cu (c) + Cu(ClO<sub>4</sub>)<sub>2</sub> (aq.) = 2 CuClO<sub>4</sub> (aq.).

**CuBr (c).** Thomsen<sup>15</sup> measured the heat of reaction of Cu<sub>2</sub>O (c) with 2 HBr (aq.) to be 20.76; whence, for CuBr (c),  $Q_f = 26.0$ . Bodlander and Storbeck<sup>1</sup> estimated  $Q_f = 25.0$ . Klein's<sup>1</sup> electromotive force data on the cell reaction, CuBr (c) + KI (aq.) = CuI (c) + KBr (aq.), yield, for CuBr (c),  $Q_f = 26.6$ .

**Cu<sub>2</sub>Br<sub>2</sub> (g).** The vapor pressure data of von Wartenberg and Bosse<sup>1</sup> and of Jellinek and Rudat<sup>2</sup> yield  $-18.8$  for the heat of vaporization at 1000°.

**CuBr<sub>2</sub> (aq.).** Rolla<sup>1</sup> measured the heat of solution of copper in bromine water to be 38.3.

**CuBr<sub>2</sub> (c).** The data on the heat of solution are: Thomsen,<sup>15</sup> 8.25<sub>400</sub><sup>20</sup>; Sabatier,<sup>7</sup> 7.9<sup>12</sup>.

**CuBr<sub>2</sub> · 4 H<sub>2</sub>O (c).** Sabatier<sup>7</sup> measured the heat of solution.

**CuBr<sub>2</sub> · 3 Cu(OH)<sub>2</sub> (c).** Sabatier<sup>9</sup> measured the heat of solution in aqueous HBr.

**CuI (c).** Thomsen<sup>15</sup> measured the heat of reaction of Cu<sub>2</sub>O (c) with 2 HI (aq.) to be 33.73; whence, for CuI (c),  $Q_f = 17.2$ . Bodlander and Storbeck<sup>1</sup> estimated  $Q_f = 16.3$ . Thomsen's<sup>15</sup> data on the reaction, 2 CuSO<sub>4</sub> (aq.) + H<sub>2</sub>O (liq.) + 2 KI (aq.) + H<sub>2</sub>SO<sub>3</sub> (aq.) = 2 CuI (c) + (2 KHSO<sub>4</sub> + H<sub>2</sub>SO<sub>4</sub>) (aq.), yield, for CuI (c),  $Q_f = 17.7$ . Berthelot's<sup>59</sup> data on the reaction of aqueous cupric sulfate with aqueous KI yield, for CuI (c),  $Q_f = 18.1$ . Joannis<sup>75</sup> data on the reaction of cupric oxide with aqueous HI yield, for CuI (c),  $Q_f = 16.2$ .

**CuI (g).** From spectroscopic data, Butkow and Terenin<sup>1</sup> reported  $Q = -131$  for the reaction CuI (g) = Cu\* (g) + I (g).

**Cu<sub>2</sub>I<sub>2</sub> (g).** The vapor pressure data of von Wartenberg and Bosse<sup>1</sup> yield  $-18.9$  for the heat of vaporization at 1300°. Gaseous cuprous iodide is practically all Cu<sub>2</sub>I<sub>2</sub>.

**CuI<sub>2</sub> (aq.).** The value for aqueous cupric iodide is obtained from the ions.

**CuI<sub>2</sub> (c).** We have estimated the heat of formation of this substance.

**CuS (c).** By direct measurement, von Wartenberg<sup>10</sup> found, for CuS (c),  $Q_f = 11.61$ . Berthelot<sup>14</sup> found the heat of reaction of  $\text{CuSO}_4$  (aq.) with  $\text{H}_2\text{S}$  (aq.) and with  $\text{Na}_2\text{S}$  (aq.) to be 13.2 and 37.4, respectively; whence, for CuS (c),  $Q_f = 11.86$  and 12.3. For the reaction,  $\text{CuSO}_4(200) + \text{Na}_2\text{S}(200) = \text{CuS (c)} + \text{Na}_2\text{SO}_4(400)$ , Thomsen<sup>15</sup> found  $Q = 37.23$ ; whence, for CuS (c),  $Q_f = 12.17$ . Equilibrium data were reported by Biltz and Juza,<sup>1</sup> Preuner and Brockmoller,<sup>1</sup> Allen and Lombard,<sup>1</sup> and Halford.<sup>1</sup>

**$\text{Cu}_2\text{S}$  (c).** By direct measurement, von Wartenberg<sup>10</sup> found, for  $\text{Cu}_2\text{S}$  (c, III),  $Q_f = 18.97$ . Thomsen's data on the reaction of cuprous chloride with aqueous sodium sulfide yield, for  $\text{Cu}_2\text{S}$  (c, III),  $Q_f = 20.1$ . Equilibrium data involving cuprous sulfide were reported by Jellinek and Zakowski,<sup>1</sup> Allen and Lombard,<sup>1</sup> Biltz and Juza,<sup>1</sup> Preuner and Brockmoller,<sup>1</sup> Tubandt and Reinhold,<sup>1</sup> Halford,<sup>1</sup> Stubbs,<sup>1</sup> Wajuchnowa,<sup>1</sup> Reinders and Goudriaan,<sup>1</sup> and Schenck and Hempelmann.<sup>1</sup> Data on the heats of transition of cuprous sulfide were obtained by Bellati and Lussana<sup>1</sup> and Bornemann and Hengstenberg.<sup>1</sup> These data were reviewed by Randall, Nielsen, and West,<sup>1</sup> whose values we have selected.

**$3\text{CuO} \cdot \text{CuSO}_4$  (c).** From their equilibrium data, Reinders and Goudriaan<sup>1</sup> assumed the existence of this substance, and reported  $Q = 39.1$  for the reaction,  $2\text{CuSO}_4$  (c) +  $\text{Cu}_2\text{O}$  (c) =  $3\text{CuO} \cdot \text{CuSO}_4$  (c) +  $\text{SO}_2$  (g); but these data are uncertain.

**$3\text{CuO} \cdot \text{CuSO}_4 \cdot 4\text{H}_2\text{O}$  (c).** Sabatier<sup>9</sup> measured the heat of solution of this substance in aqueous sulfuric acid.

**$\text{Cu}_2\text{SO}_4$  (c).** Recoura<sup>4</sup> found  $Q = 21.0$  for the reaction,  $\text{Cu}_2\text{SO}$  (c) =  $\text{Cu}$  (c) +  $\text{CuSO}_4$  (aq.).

**$\text{Cu}_2\text{SO}_4$  (aq.).** From equilibrium data, Heinerth<sup>1</sup> computed  $Q = -9.4$  for the reaction,  $\text{CuSO}_4$  (aq.) +  $\text{Cu}$  (c) =  $\text{Cu}_2\text{SO}_4$  (aq.).

**$\text{CuS}_2\text{O}_6$  (aq.).** The value for this substance is obtained from those for the ions.

**$\text{CuS}_2\text{O}_6 \cdot 5\text{H}_2\text{O}$  (c).** Thomsen<sup>15</sup> measured the heat of solution.

**$\text{CuSO}_4 \cdot 2\text{HCl}$  (c).** Ephraim<sup>7</sup> obtained dissociation pressure data on this substance.

**CuSe (c).** Favre's<sup>2</sup> data on the reaction of aqueous cupric acetate with gaseous hydrogen selenide yield, for CuSe (c),  $Q_f = 19$ .

**$\text{Cu}_2\text{Se}$  (c).** Favre's<sup>2</sup> data on the reaction of cuprous selenide with bromine water yield, for  $\text{Cu}_2\text{Se}$  (c, II),  $Q_f = 14.5$ . The equilibrium data of Tubandt and Reinhold<sup>1</sup> on the reaction,  $\text{Ag}_2\text{S}$  (c) +  $\text{Cu}_2\text{Se}$  (c) =  $\text{Ag}_2\text{Se}$  (c) +  $\text{Cu}_2\text{S}$  (c), yield, for  $\text{Cu}_2\text{Se}$  (c, I),  $Q_f = 10.6$ . Bellati and Lussana<sup>1</sup> gave  $T = -1.12^{110}$  for the transition from II to I.

**$\text{CuSeO}_4$  (aq.).** Metzner<sup>1</sup> found  $Q = 13.07$  for the reaction,  $\text{CuSeO}_4$  (aq.) +  $2\text{KOH}$  (aq.) =  $\text{K}_2\text{SeO}_4$  (aq.) +  $\text{Cu(OH)}_2$  (c).

**$\text{CuSeO}_4 \cdot 5\text{H}_2\text{O}$  (c).** Metzner<sup>1</sup> measured the heat of solution of the pentahydrate.

**$\text{CuN}_3$  (c).** Wohler and Martin<sup>1</sup> measured the heat of decomposition of copper azide to be 56.8.

$\text{Cu}(\text{NO}_3)_2$  (aq.). Thomsen<sup>15</sup> measured the heat of the reaction,  $2 \text{AgNO}_3(400) + \text{Cu}(c) = 2 \text{Ag}(c) + \text{Cu}(\text{NO}_3)_2(800)$ , to be 35.63; whence, for  $\text{Cu}(\text{NO}_3)_2(800)$ ,  $Q_f = 83.55$ . Thomsen's<sup>15</sup> data on the reaction between aqueous barium nitrate and aqueous cupric sulfate yield, for  $\text{Cu}(\text{NO}_3)_2(200)$ ,  $Q_f = 81.4$ . Data on the heat of dilution of aqueous copper nitrate were reported by Thomsen<sup>15</sup> and Berthelot.<sup>5</sup>

$\text{Cu}(\text{NO}_3)_2$  (c). Guntz and Martin<sup>1</sup> measured the heat of solution.

$\text{Cu}(\text{NO}_3)_2 \cdot 3 \text{H}_2\text{O}$  (c). Sabatier<sup>9</sup> measured the heat of solution.

$\text{Cu}(\text{NO}_3)_2 \cdot 6 \text{H}_2\text{O}$  (c). The data on the heat of solution are: Sabatier,<sup>9</sup>  $-10.5^{15}$ ; Thomsen,<sup>15</sup>  $-10.71_{400}$ . Reisenfeld and Milchsack<sup>1</sup> found the heat of fusion to be  $-8.68^{26}$ .

$\text{Cu}(\text{NO}_3)_2 \cdot n\text{NH}_3$  (c). Ephraim and Bolle<sup>2</sup> measured the dissociation pressures of the tetra- and hexammines.

$\text{Cu}(\text{NO}_3)_2 \cdot 3 \text{CuO} \cdot 3 \text{H}_2\text{O}$  (c). Sabatier<sup>9</sup> measured the heat of solution in aqueous nitric acid.

$\text{CuCl}_2 \cdot n\text{NH}_3$  (aq.). Bouzat<sup>1</sup> measured the heat of adding 4, 6, 8, and 12  $\text{NH}_3$  (aq.) to  $\text{CuCl}_2$  (aq.).

$\text{CuSO}_4 \cdot n\text{NH}_3$  (aq.). Bouzat<sup>1</sup> measured the heats of adding 4, 6, 8, and 12  $\text{NH}_3$  (aq.) to  $\text{CuSO}_4$  (aq.).

$\text{Cu}(\text{C}_2\text{H}_3\text{O}_2)_2 \cdot n\text{NH}_3$  (aq.). Bouzat<sup>1</sup> measured the heats of adding 4, 6, 8, and 12  $\text{NH}_3$  (aq.) to 1 mole of aqueous cupric acetate.

$\text{Cu}(\text{NH}_3)_n^{++}$  (aq.). The values given for the heats of formation of these ions, with  $n=4, 6, 8$ , and 12, are purely formal, since the actual ion is probably  $\text{Cu}(\text{NH}_3)_4^{++}$ . The values are obtained from the values for the aqueous ammonia solutions of cupric acetate, cupric chloride, and cupric sulfate.

$\text{CuCl}_2 \cdot 2 \text{NH}_3$  (c). Bouzat<sup>1</sup> measured the heat of solution of the diammine to be  $3.37$  in 6  $\text{NH}_3$  (aq.) and  $7.95$  in  $\text{HCl}$  (aq.); Biltz, Brohan, and Wein<sup>1</sup> found the heat of solution in  $\text{HCl}(20)$  to be  $6.1$ . Biltz, Klatte, and Rahlfs<sup>1</sup> reported  $D = -21$ .

$\text{CuCl}_2 \cdot 2 \text{NH}_3 \cdot \frac{1}{2} \text{H}_2\text{O}$  (c). Bouzat<sup>1</sup> measured the heat of solution in aqueous ammonia.

$\text{CuCl}_2 \cdot 3\frac{1}{2}\text{NH}_3$  (c). Biltz, Klatte, and Rahlfs<sup>1</sup> reported  $D = -14.1$ .

$\text{CuCl}_2 \cdot 4 \text{NH}_3 \cdot 2 \text{H}_2\text{O}$  (c). Bouzat<sup>1</sup> measured the heat of solution in aqueous ammonia.

$\text{CuCl}_2 \cdot n\text{NH}_3$  (c). Biltz, Klatte, and Rahlfs<sup>1</sup> reported dissociation pressure data on the amines with 5, 6, and 10  $\text{NH}_3$ . See also Biltz, Brohan, and Wein<sup>1</sup> and Ephraim.<sup>1, 3, 5</sup>

$\text{CuCl}_2 \cdot 5 \text{NH}_3 \cdot n\text{H}_2\text{O}$  (c). Bouzat<sup>1</sup> measured the heats of solution of these hydrated pentammines with  $\frac{1}{2}$  and  $1\frac{1}{2}$   $\text{H}_2\text{O}$ .

$\text{CuCl}_2 \cdot 2 \text{NH}_4\text{Cl} \cdot n\text{H}_2\text{O}$  (c). Bouzat<sup>1</sup> and Bouzat and Chauvenet<sup>1</sup> measured the heats of solution of the anhydrous compound and of the dihydrate.

$\text{CuCl} \cdot n\text{NH}_3$  (c). Biltz and Stollenwerk<sup>2</sup> obtained dissociation pressure data on the amines with 1,  $1\frac{1}{2}$ , and 3  $\text{NH}_3$ . See also Lloyd.<sup>1</sup>

$\text{CuBr}_2 \cdot n\text{NH}_3$  (c). Biltz, Brohan, and Wein<sup>1</sup> measured the heat of

solution of the diammine in aqueous HCl, and obtained dissociation pressure data on the ammines with 2,  $3\frac{1}{2}$ , 5, 6, and 10  $\text{NH}_3$ . See also Biltz, Klatte, and Rahlfs<sup>1</sup> and Ephraim.<sup>1, 9</sup>

$\text{CuBr} \cdot n\text{NH}_3$  (c). Biltz and Stollenwerk<sup>1</sup> obtained dissociation pressure data on the ammines with 1,  $1\frac{1}{2}$ , and 3  $\text{NH}_3$ . See also Lloyd.<sup>1</sup>

$\text{CuI}_2 \cdot n\text{NH}_3$  (c). Biltz, Brohan, and Wein<sup>1</sup> reported dissociation pressure data on the ammines with 2,  $3\frac{1}{2}$ , 5, and 10  $\text{NH}_3$ . See also Ephraim.<sup>9</sup>

$\text{CuI} \cdot n\text{NH}_3$  (c). Biltz and Stollenwerk<sup>1</sup> measured the dissociation pressures of the ammines with  $\frac{1}{2}$ , 1, 2, and 3  $\text{NH}_3$ . See also Lloyd.<sup>1</sup>

$\text{Cu}(\text{ClO}_3)_2 \cdot n\text{NH}_3$  (c). Ephraim and Bolle<sup>2</sup> measured the dissociation pressures of the tetra- and hexammines.

$\text{Cu}(\text{IO}_3)_2 \cdot 5\text{NH}_3$  (c). Ephraim and Bolle<sup>2</sup> measured the dissociation pressure of the pentammine.

$\text{Cu}(\text{ClO}_4)_2 \cdot n\text{NH}_3$  (c). Ephraim and Bolle<sup>2</sup> measured the dissociation pressures of the tetra- and hexammines.

$\text{CuSO}_4 \cdot n\text{NH}_3$  (c). Bouzat<sup>1</sup> measured the heats of solution in aqueous ammonia of the mono-, di-, and tetrammines. Ephraim<sup>8, 10</sup> measured the dissociation pressures of the tetra- and pentammines. Bouzat<sup>1</sup> obtained data on the hexammine.

$\text{CuSO}_4 \cdot 4\text{NH}_3 \cdot 1\frac{1}{2}\text{H}_2\text{O}$  (c). Bouzat<sup>1</sup> measured the heat of solution in aqueous ammonia.

$\text{CuSO}_4 \cdot (\text{NH}_4)_2\text{SO}_4 \cdot n\text{H}_2\text{O}$  (c). Bouzat<sup>1</sup> measured the heat of solution of the hexahydrate; Favre<sup>3</sup> (See Bouzat<sup>1</sup>) measured that of the anhydrous salt. Caven and Ferguson<sup>1</sup> measured the dissociation pressures for the system, hexahydrate -dihydrate -water vapor, and found  $D = -18.5$ .

$\text{CuS}_2\text{O}_6 \cdot n\text{NH}_3$  (c). Ephraim and Bolle<sup>2</sup> measured the dissociation pressures of the tetra- and pentammines.

$\text{CuS}_4\text{O}_6 \cdot 4\text{NH}_3$  (c). Ephraim and Bolle<sup>2</sup> measured the dissociation pressures.

$\text{CuP}_2$  (c). Granger<sup>1</sup> obtained equilibrium data on the reaction,  $2\text{CuP}_2$  (c) =  $2\text{Cu}$  (c) +  $\text{P}_4$  (g).

$\text{Cu}_3\text{Sb}$  (c). Biltz and Haase<sup>1</sup> measured the heats of solution in aqueous (30 per cent)  $\text{KBr}_3$  of  $3\text{Cu}$  (c) +  $\text{Sb}$  (c) and of  $\text{Cu}_3\text{Sb}$  (c).

$\text{CuCO}_3 \cdot \text{Cu}(\text{OH})_2$  (c). Berthelot<sup>12</sup> found the reaction of aqueous copper sulfate with aqueous sodium carbonate to go in two stages, with  $Q = -2.1$  and  $1.7$ , respectively. The product is indefinite, but probably approximates  $\text{CuCO}_3 \cdot \text{Cu}(\text{OH})_2$  (c).

$\text{Cu}(\text{CHO}_2)_2$  (aq.). Berthelot<sup>9, 10</sup> measured the heat of neutralization of aqueous formic acid with cupric hydroxide.

$\text{Cu}(\text{CHO}_2)_2$  (c). Berthelot<sup>9, 10</sup> measured the heat of solution of cupric formate.

$\text{Cu}(\text{CHO}_2)_2 \cdot 4\text{H}_2\text{O}$  (c). Berthelot<sup>9, 10</sup> measured the heat of solution of cupric formate tetrahydrate.

$\text{Cu}(\text{C}_2\text{H}_3\text{O}_2)_2$  (aq.). Berthelot<sup>5, 9</sup> measured the heat of neutralization

of aqueous acetic acid with cupric hydroxide. Thomsen<sup>15</sup> measured the heat of reaction of aqueous cupric acetate with aqueous barium hydroxide.

$\text{Cu}(\text{C}_2\text{H}_3\text{O}_2)_2$  (c). Berthelot<sup>5, 9</sup> measured the heat of solution of cupric acetate.

$\text{Cu}(\text{C}_2\text{H}_3\text{O}_2)_2 \cdot \text{H}_2\text{O}$  (c). For the heat of solution, Berthelot<sup>5, 9</sup> found  $-0.80_{220}^{10}$ ; Thomsen<sup>15</sup> found  $0.17_{400}^{18}$ .

$\text{Cu}(\text{C}_2\text{H}_3\text{O}_3)_2$  (c). de Forcrand<sup>3</sup> measured the heat of reaction of solid copper glycollate with aqueous hydrogen sulfide.

$\text{Cu}(\text{C}_2\text{H}_3\text{O}_3)_2$  (aq.). de Forcrand<sup>3</sup> measured the heat of reaction of aqueous cupric sulfate with aqueous lead glycollate.

$\text{Cu}_2\text{Cl}_2 \cdot \text{CO} \cdot 2 \text{H}_2\text{O}$  (aq.). Hammerl<sup>1</sup> reported the heat of formation of this substance.

$\text{Cu}_2\text{Cl}_2 \cdot \text{CO} \cdot 2 \text{H}_2\text{O}$  (c). Hammerl<sup>1</sup> reported the heat of formation of this substance.

$\text{CuCl}_2 \cdot 2 \text{CH}_3\text{OH}$  (c). Dissociation pressure data were reported by Lloyd, Brown, Bonnell, and Jones.<sup>1</sup>

$\text{Cu}(\text{C}_2\text{H}_5\text{SO}_4)_2$  (aq.). Thomsen<sup>15</sup> measured the heat of mixing aqueous barium ethyl sulfate with aqueous cupric sulfate.

$\text{CuONC}$  (c). Wohler and Martin<sup>1</sup> measured the heat of decomposition to be 50.0.

$\text{CuCN}$  (aq.). Varet<sup>3</sup> measured the heat of reaction of cuprous iodide with aqueous mercuric cyanide.

$\text{Cu}_3\text{Sn}$  (c). Biltz<sup>6</sup> and Herschkowitsch<sup>2</sup> measured the heats of solution of various bronzes. Biltz<sup>6</sup> found, for  $\text{Cu}_3\text{Sn}$  (c),  $Q_f = 8.0$

$\text{Cu}_2\text{Zn}_3$  (c). Biltz,<sup>6</sup> Baker,<sup>2</sup> Galt,<sup>1</sup> and Herschkowitsch<sup>2</sup> investigated the heats of formation of the brasses. Biltz<sup>6</sup> found, for  $\text{Cu}_2\text{Zn}_3$  (c),  $Q_f = 16.0$ .

$\text{Cu}_2\text{Cd}_3$  (c). This alloy was studied by Biltz and Haase,<sup>1</sup> Roos,<sup>2</sup> and Schreiner and Seljesaeter.<sup>1</sup> Biltz and Haase<sup>1</sup> found, for  $\text{Cu}_2\text{Cd}_3$  (c),  $Q_f = 3.0$ .

$\text{CuC}_2\text{O}_4 \cdot 5 \text{NH}_3$  (c). Ephraim and Bolle<sup>2</sup> measured the dissociation pressures of the pentammine of cupric oxalate.

$\text{Cu}(\text{CHO}_2)_2 \cdot 4 \text{NH}_3$  (c). Ephraim and Bolle<sup>2</sup> measured the dissociation pressures of the tetrammine of cupric formate.

$\text{Cu}(\text{C}_2\text{H}_3\text{O}_2)_2 \cdot 4 \text{NH}_3$  (c). Ephraim and Bolle<sup>2</sup> measured the dissociation pressures of the tetrammine of cupric acetate.

$\text{Cu}(\text{CNS})_2 \cdot n\text{NH}_3$  (c). Ephraim and Bolle<sup>2</sup> measured the dissociation pressures of the tetra- and hexammines.

$\text{CuSO}_4 \cdot \text{Ti}_2\text{SO}_4 \cdot 6 \text{H}_2\text{O}$  (c). Caven and Ferguson<sup>1</sup> measured the dissociation pressures for the system, hexahydrate -dihydrate -water vapor.

## SILVER

$\text{Ag}$  (c). Standard state. Though both Berthelot<sup>122</sup> and Petersen<sup>5</sup> reported significant differences (1.2 and 3.2, respectively) between the heat contents of electrolytic and precipitated silver, modern evidence indicates that there is but one form of solid silver. Some of the observed

differences in heat content may be due to differences in the size of the crystals.

**Ag (liq.).** The data on the heat of fusion of silver are: Person,<sup>1</sup> -2.28; Umino,<sup>3</sup> -2.69; Wust, Meuthen, and Durrer,<sup>1</sup> -2.8.

**Ag (g).** Vapor pressure data were reported by Greenwood,<sup>2, 3, 5, 6</sup> Ruff and Bergdahl,<sup>1</sup> von Wartenberg,<sup>3, 7</sup> Harteck,<sup>2</sup> and Jones, Langmuir, and Mackay.<sup>1</sup> van Liempt<sup>2</sup> reviewed the data. See also Piersol<sup>1</sup> and Tiede and Birnbrauer.<sup>1</sup> We have assumed gaseous silver to be monatomic.

The energy states of gaseous monatomic silver have been evaluated from the data of Fowler,<sup>3</sup> Blair,<sup>1</sup> Kayser and Runge,<sup>1</sup> Randall,<sup>1</sup> Ritz,<sup>1</sup> Shenstone,<sup>1, 3</sup> Fujioka and Nakamura,<sup>1</sup> White,<sup>1</sup> Frings,<sup>1</sup> McLennan and McLay,<sup>2</sup> Majumdar,<sup>1</sup> and Gibbs and White.<sup>1</sup>

**Ag<sup>+</sup> (aq.).** The value for this substance is obtained from those for AgNO<sub>3</sub> (aq.) and NO<sub>3</sub><sup>-</sup> (aq.).

**Ag<sub>2</sub>O (c).** Equilibrium data on the decomposition of silver oxide were reported by Lewis,<sup>4</sup> Keyes and Hara,<sup>1</sup> and Benton and Drake.<sup>1</sup> Lewis and Randall<sup>5</sup> calculated from the data of the first two investigations,  $Q_f = 6.95$ ; while Benton and Drake<sup>1</sup> calculated  $Q_f = 7.02$ . Mixter's<sup>12</sup> data yield  $Q_f = 6.2$ . See also Biltz,<sup>8</sup> Favre and Silbermann,<sup>2</sup> and Newton.<sup>1</sup>

**Ag<sub>2</sub>O<sub>2</sub> (c).** Jirsa<sup>2, 3, 4</sup> measured the heats of solution of Ag<sub>2</sub>O (c) and of Ag<sub>2</sub>O<sub>2</sub> (c) in aqueous HClO<sub>4</sub> and aqueous HNO<sub>3</sub>; and measured the heats of reduction of Ag<sub>2</sub>O (c) and of Ag<sub>2</sub>O<sub>2</sub> (c) with aqueous N<sub>2</sub>H<sub>2</sub>. His data yield, for Ag<sub>2</sub>O<sub>2</sub> (c),  $Q_f = 5.95$  and 6.4, respectively.

**AgH (g).** Farkas<sup>1</sup> studied the equilibrium,  $2 \text{ Ag (c)} + \text{H}_2 \text{ (g)} = 2 \text{ AgH (g)}$ , spectroscopically, and calculated  $Q = 7.5$ .

**AgNO<sub>3</sub> (aq.).** For the heat of solution of Ag<sub>2</sub>O (c) in aqueous nitric acid, Jirsa<sup>1</sup> found 12.2 and Berthelot<sup>128</sup> 10.32; whence, for AgNO<sub>3</sub> (aq.),  $Q_f = 24.5$  and 23.6, respectively. Thomsen's<sup>15</sup> data on the reactions of Ba(OH)<sub>2</sub>(400) with 2 AgNO<sub>3</sub>(200) and with 2 HNO<sub>3</sub>(200),  $Q = 17.38$  and 28.28, respectively, yield, for AgNO<sub>3</sub>(200),  $Q_f = 23.83$ . Lange and Fuoss<sup>1</sup> data on the reaction of AgNO<sub>3</sub>(600) with KCl(660),  $Q = 15.77^{25}$ , yield, for AgNO<sub>3</sub>(600),  $Q_f = 23.92$ . Thomsen's<sup>15</sup> data on the reaction of AgNO<sub>3</sub>(200) with KCl(200) and with HCl(200) yield  $Q = 15.87$  and 15.75, respectively, whence, for AgNO<sub>3</sub>(200),  $Q_f = 23.99$  and 24.10. See also Berthelot<sup>12</sup> and Andre.<sup>1</sup> Berthelot,<sup>12</sup> Lange and Shibata,<sup>1</sup> and Thomsen<sup>15</sup> measured the heat of reaction of aqueous silver nitrate with aqueous potassium iodide. The data of the latter two investigations yield, respectively, AgNO<sub>3</sub>(1000),  $Q_f = 24.22$ , and AgNO<sub>3</sub>(400),  $Q_f = 24.36$ . Jahn<sup>1</sup> obtained electromotive force data on the cell reaction of Pb (c) with 2 AgNO<sub>3</sub> (aq.). Data on the heat of dilution of aqueous silver nitrate were reported by Fricke and Havestadt.<sup>1</sup>

**AgNO<sub>3</sub> (c, II).** The data on the heat of solution are Thomsen,<sup>15</sup> -5.46<sub>400</sub>; Berthelot,<sup>10</sup> -5.7; Favre and Silbermann,<sup>10</sup> -5.3; Bruni and Levi,<sup>2</sup> -5.3. See also Petersen.<sup>5</sup>

**AgNO<sub>3</sub> (c, I).** Bridgman<sup>6a</sup> reported the heat of transition.

**AgNO<sub>3</sub> (liq.).** Magnus and Oppenheimer<sup>1</sup> reported the heat of fusion of silver nitrate.

**AgCl (c).** The electromotive force data of Gerke<sup>1</sup> and of Wolff<sup>2</sup> on the cell reaction,  $\text{Ag (c)} + \frac{1}{2} \text{Cl}_2 \text{ (g)} = \text{AgCl (c)}$ , yield  $Q_f = 30.32$  and  $30.16$ , respectively. The electromotive force data on the cell reaction,  $\text{Ag (c)} + \text{HgCl (c)} = \text{AgCl (c)} + \text{Hg (liq.)}$ , yield the following values for  $Q$ : Brönsted,<sup>1</sup>  $-1.40$ ; Gerke,<sup>1</sup>  $-1.276$ ; Brönsted,<sup>2a</sup>  $-1.30$ ; Halle,<sup>2</sup>  $-1.40$ . See also the electromotive force data of Gerke,<sup>1</sup> Brönsted,<sup>4</sup> Halle,<sup>2</sup> and Krahmer<sup>1</sup> on the cell reaction,  $2 \text{Ag (c)} + \text{PbCl}_2 \text{ (c)} = 2 \text{AgCl (c)} + \text{Pb (c)}$ . See also Noyes and Ellis,<sup>1</sup> Harned and Brumbaugh,<sup>1</sup> Butler and Robertson,<sup>1</sup> Melcher,<sup>1</sup> and Rossini.<sup>10</sup> Berthelot<sup>86</sup> and Lange and Fuoss<sup>1</sup> found the difference in energy content of the variously prepared forms of silver chloride to be small.

**AgCl (liq.).** The data on the heat of fusion are: Weber,<sup>1</sup>  $-4.4$ ; Goodwin and Kalmus,<sup>1</sup>  $-3.06$ .

**AgCl (g).** Vapor pressure data were reported by von Wartenberg and Bosse<sup>1</sup> and Maier.<sup>6</sup> Brice<sup>1</sup> reported a value of  $-72.3$  for the energy of dissociation of gaseous silver chloride at  $-273^\circ$ , from spectroscopic data. The assumption that the dissociated atoms are in the normal state yields, for  $\text{AgCl (g)}$ ,  $Q_f = -24.7$ .

**AgI (c, II).** Webb's<sup>1, 2</sup> data on the direct combination of silver with iodine yield  $Q_f = 14.94$ . Webb's<sup>1, 2</sup> data on the heats of dissolving, in concentrated aqueous KI,  $\text{AgI (c)}$  and  $\text{Ag (c)} + \text{I}_2 \text{ (c)}$  yield, for  $\text{AgI (c)}$ ,  $Q_f = 15.01$ . In similar experiments with aqueous KCN as the solvent, Webb's<sup>1, 2</sup> found, for  $\text{AgI (c)}$ ,  $Q_f = 15.2$ . From experiments similar to the latter Braune and Koref<sup>1</sup> found  $Q_f = 15.1$ . The electromotive force data yield the following values: Taylor and Anderson,<sup>1</sup>  $15.13$ ; Jones and Kaplan,<sup>1</sup>  $14.35$ ; Gerke,<sup>1</sup>  $14.81$ ; Taylor,<sup>2</sup>  $15.15$ . From the difference in the heats of solution of  $\text{AgCl (c)}$  and  $\text{AgI (c)}$  in aqueous KCN, the data of Fischer<sup>1</sup> and Wolff<sup>1</sup> yield, for  $\text{AgI (c)}$ ,  $Q_f = 15.1$  and  $14.93$ . See Bodlander<sup>2</sup> and Bernoulli.<sup>1</sup>

**AgI (c, I).** The following are the data on the transition from II to I at  $146^\circ$ : Cohen and Joss,<sup>1</sup>  $-1.26$ ; Mallard and LeChatelier,<sup>1</sup>  $-1.5$ .

**AgI (g).** Jellinek and Rudat<sup>2</sup> computed the heat of vaporization from vapor pressure data. From the spectroscopic absorption limit and the assumption that the products of dissociation are a normal silver atom and an excited iodine atom, Franck and Kuhn<sup>1</sup> computed a value for the energy of dissociation of gaseous silver iodide which leads to the value  $Q_f = -38$  for  $\text{AgI (g)}$ .

**AgF (aq.).** Petersen<sup>3</sup> measured the heat of reaction of  $\text{AgF (aq.)}$  with  $\text{HCl (aq.)}$  to be  $13.31$ ; Guntz<sup>1</sup> that of  $\text{AgF (aq.)}$  with  $\text{KOH (aq.)}$  to be  $17.6$ .<sup>10</sup>

**AgF (c).** Guntz<sup>1</sup> measured the heat of solution.

**AgF (amorphous, red).** Guntz<sup>1</sup> measured the heat of solution.

**AgF ·  $n\text{H}_2\text{O}$  (c).** Guntz<sup>1</sup> measured the heat of solution of the tetrahydrate; Guntz and Guntz<sup>1, 2</sup> those of the mono- and dihydrates.

**AgHF<sub>2</sub> (aq.).** Guntz<sup>1</sup> measured the heat of mixing AgF (aq.) + HF (aq.) to be 2.0.

**Ag<sub>2</sub>F (c).** Guntz<sup>10</sup> measured the heat of solution.

**Ag<sub>2</sub>Cl (c).** Without giving details, Guntz<sup>11</sup> reported for the reaction, Ag (c) + AgCl (c) = Ag<sub>2</sub>Cl (c),  $Q = 0.5$ .

**AgClO<sub>3</sub> (aq.).** The value for this substance is obtained from those for the ions.

**AgClO<sub>3</sub> (c).** Foote and Saxon<sup>1</sup> measured the heat of solution. See also Bedeau.<sup>1</sup>

**AgClO<sub>4</sub> (aq.).** Jirsa<sup>1</sup> found the heats of reaction of AgClO<sub>4</sub> (aq.) with HCl (aq.), HBr (aq.), and HI (aq.), respectively, to be 15.75, 20.52, and 26.87. Jirsa<sup>1</sup> also measured the heat of reaction of Ag<sub>2</sub>O (c) with concentrated HClO<sub>4</sub> (aq.).

**AgClO<sub>4</sub> (c).** Bruni and Levi<sup>2</sup> measured the heat of solution.

**AgBr (c).** Webb's<sup>1, 2</sup> electromotive force data on the reaction, Ag (c) +  $\frac{1}{2}$  Br<sub>2</sub> (liq.) = AgBr (c), yield  $Qf = 23.81$ . Krahmer's<sup>1</sup> electromotive force data on the reaction, AgI (c) +  $\frac{1}{2}$  PbBr<sub>2</sub> (c) = AgBr (c) +  $\frac{1}{2}$  PbI<sub>2</sub> (c), yield, for AgBr (c),  $Qf = 24.16$ . See also Klein<sup>1</sup> and Bernoulli.<sup>1</sup> Berthelot<sup>12</sup> and Thomsen<sup>15</sup> measured the heat of reaction of aqueous silver nitrate with aqueous hydrobromic acid. The latter's data yield, for AgBr (c),  $Qf = 23.68$ .

**AgBr (g).** Jellinek and Rudat<sup>2</sup> computed the heat of vaporization from vapor pressure data.

**AgBr (liq.).** We have estimated the heat of fusion.

**3 AgI · HI · 7 H<sub>2</sub>O (c).** Berthelot<sup>69</sup> measured the heat of solution.

**AgI<sub>3</sub><sup>-</sup> (aq.).** Webb<sup>1</sup> measured the heat of solution of silver iodide in concentrated aqueous potassium iodide to be 1.8. See also Berthelot.<sup>151</sup>

**Ag<sub>2</sub>S (c, II).** Thomsen's<sup>15</sup> data on the reaction of 2 AgNO<sub>3</sub> (100) with Na<sub>2</sub>S (200) yield, for Ag<sub>2</sub>S (c, II),  $Qf = 6.86$ . Berthelot's<sup>14, 133</sup> data on the similar reaction with H<sub>2</sub>S (aq.) yield  $Qf = 5.0$ . Equilibrium data on the reaction, Ag<sub>2</sub>S (c) + H<sub>2</sub> (g) = H<sub>2</sub>S (g) + 2 Ag (c), were reported by Jellinek and Zakowski,<sup>1</sup> Pelabon,<sup>3</sup> Keyes and Felsing,<sup>1</sup> and Watanabe.<sup>1</sup> The latter calculated  $Qf = 5.1$ . See also Jellinek and Podjaski<sup>1</sup> and Noyes and Freed.<sup>1</sup>

**Ag<sub>2</sub>S (c, I).** Bellati and Lussana<sup>1</sup> reported the heat of transition.

**Ag<sub>2</sub>SO<sub>4</sub> (aq.).** Thomsen's<sup>15</sup> data on the reaction of Ag<sub>2</sub>SO<sub>4</sub> (aq.) with 2 KOH (aq.) yield, for Ag<sub>2</sub>SO<sub>4</sub> (aq.),  $Qf = 165.27$ . See also Berthelot.<sup>128</sup>

**Ag<sub>2</sub>SO<sub>4</sub> (c).** From indirect measurements, Thomsen<sup>15</sup> reported the heat of solution to be -4.48. Thomsen's<sup>15</sup> data on the reaction of 2 AgNO<sub>3</sub> (100) with (NH<sub>4</sub>)<sub>2</sub>SO<sub>4</sub> (100) yield -4.58 for the heat of solution of silver sulfate. See also Marchal.<sup>3</sup>

**Ag(S<sub>2</sub>O<sub>3</sub>)<sub>2</sub><sup>-</sup> (aq.).** Fogh<sup>1</sup> measured the heat of reaction of aqueous silver nitrate with excess aqueous sodium thiosulfate to be 20.0.

**Ag<sub>2</sub>S<sub>2</sub>O<sub>6</sub> (aq.).** The value for this substance is obtained from the ions.

$\text{Ag}_2\text{S}_2\text{O}_6 \cdot 2 \text{H}_2\text{O}$  (c). Thomsen<sup>15</sup> measured the heat of solution.

$\text{Ag}_2\text{Se}$  (c, II). Fabre<sup>2</sup> measured the heats of reaction of silver selenide with bromine water and of aqueous silver acetate with gaseous hydrogen selenide. See also Pelabon<sup>1</sup> and Tubandt and Reingold.<sup>1</sup>

$\text{Ag}_2\text{Se}$  (c, I). Bellati and Lussana<sup>1</sup> reported the heat of transition.

$\text{Ag}_2\text{SeO}_4$  (c). Metzner<sup>1, 2</sup> measured the heat of reaction of aqueous silver nitrate with aqueous potassium selenate to be 8.48.

$\text{AgN}_3$  (c). Wohler and Martin<sup>1</sup> measured the heat of decomposition of silver azide to be 67.3.

$\text{AgNO}_2$  (aq.). Berthelot<sup>9, 10, 28</sup> reported a value for the heat of neutralization of nitrous acid with silver oxide.

$\text{AgNO}_2$  (c). Berthelot<sup>9, 10, 28</sup> measured the heat of solution.

$\text{Ag}_2\text{N}_2\text{O}_2$  (c). Berthelot and Ogier<sup>7</sup> reported a value for the heat of neutralization of hyponitrous acid with silver oxide.

$\text{Ag}_2\text{O}_2 \cdot \text{HNO}_3 \cdot 2 \text{H}_2\text{O}$  (liq.). Jirsa<sup>2</sup> reported a value for the heat of formation of this substance.

$\text{AgNO}_3 \cdot n\text{NH}_3$  (aq.). Bruni and Levi<sup>1</sup> measured the heat of mixing  $\text{AgNO}_3$ (100) with  $2 \text{NH}_3$ (1100) to be 12.79, and found no evolution of heat on the addition of more ammonia. For the same reaction, Berthelot and Delepine<sup>2</sup> found  $Q = 13.39$ . These investigators also measured the heat of reaction of  $\text{AgNO}_3 \cdot 2 \text{NH}_3$  (aq.) with aqueous nitric acid to be 11.64 and 12.25, respectively. Bruni and Levi<sup>2</sup> measured the heat of reaction of the aqueous triammine with aqueous nitric acid to be 24.01.

$\text{AgNO}_3 \cdot 2 \text{NH}_3$  (c). The data on the heat of solution are: Bruni and Levi,<sup>2</sup> -9.05; Berthelot and Delepine,<sup>2</sup> -8.97; Jirsa and Diamant,<sup>1</sup> -9.23.

$\text{AgNO}_3 \cdot \text{NH}_3$  (c). Data on the dissociation pressure of the system, diammine-monoammine- $\text{NH}_3$  (g), were reported by Ephraim.<sup>4</sup> See also Joannis and Crozier<sup>1</sup> and Lemoult.<sup>1</sup>

$\text{AgNO}_3 \cdot 3 \text{NH}_3$  (c). For the heat of solution Bruni and Levi<sup>2</sup> found -10.44 in water, Jirsa and Diamant<sup>1</sup> -9.23 in aqueous nitric acid. Data on the dissociation pressure of the triammine were reported by Ephraim.<sup>4</sup> See also Joannis and Crozier<sup>1</sup> and Lemoult.<sup>1</sup>

$\text{AgClO}_4 \cdot n\text{NH}_3$  (aq.). Bruni and Levi<sup>2</sup> measured the heat of mixing aqueous silver perchlorate with aqueous ammonia.

$\text{AgClO}_4 \cdot n\text{NH}_3$  (c). Bruni and Levi<sup>2</sup> measured the heats of solution of the di- and triammines.

$\text{Ag}(\text{NH}_3)_2^+$  (aq.). The value for this substance is obtained from those for  $\text{AgNO}_3 \cdot 2 \text{NH}_3$  (aq.) and  $\text{NO}_3^-$  (aq.).

$\text{AgX} \cdot n\text{NH}_3$  (c). Isambert<sup>5</sup> reported values for the heats for formation of  $\text{AgCl} \cdot 3 \text{NH}_3$  (c) and of  $\text{AgCl} \cdot 1\frac{1}{2} \text{NH}_3$  (c), computed from unpublished values for the heats of solution. The dissociation pressure data of Biltz and Stollenwerk<sup>1</sup> yield values for the amines of  $\text{AgCl}$  with 1,  $1\frac{1}{2}$ , and 3  $\text{NH}_3$ , for those of  $\text{AgBr}$  with 1,  $1\frac{1}{2}$ , and 3  $\text{NH}_3$ , and for those of  $\text{AgI}$  with  $\frac{1}{2}$ , 1,  $1\frac{1}{2}$ , 2, and 3  $\text{NH}_3$ . See also Jarry,<sup>1</sup> Bonnefoi,<sup>1</sup> and Joannis and Crozier.<sup>1</sup>

$\text{AgBrO}_3 \cdot 3 \text{NH}_3$  (c). Ephraim<sup>4</sup> obtained dissociation pressure data on this ammine.

$\text{AgNO}_2 \cdot 3 \text{NH}_3$  (c). Ephraim<sup>4</sup> obtained dissociation pressure data on this ammine.

$\text{Ag}_2\text{C}_2$  (c). Berthelot and Delepine<sup>1</sup> measured the heat of reaction of acetylene with  $2 \text{AgNO}_3 \cdot 2 \text{NH}_3$  (c), and the heat of solution of  $\text{Ag}_2\text{C}_2$  (c) in aqueous silver nitrate.

$\text{Ag}_2\text{C}_2 \cdot n\text{AgCl}$  (c). Berthelot and Delepine<sup>1</sup> measured the heats of solution of  $\text{Ag}_2\text{C}_2 \cdot \text{AgCl}$  (c) and of  $\text{Ag}_2\text{C}_2 \cdot \frac{1}{2} \text{AgCl}$  (c) in aqueous HCl.

$\text{Ag}_2\text{C}_2 \cdot n\text{AgI}$  (c). Berthelot and Delepine<sup>1</sup> measured the heats of solution in aqueous HCl of  $\text{Ag}_2\text{C}_2 \cdot \text{AgI}$  (c) and of  $\text{Ag}_2\text{C}_2 \cdot 2 \text{AgI}$  (c).

$\text{Ag}_2\text{C}_2 \cdot \frac{1}{2} \text{Ag}_2\text{SO}_4$  (c). Berthelot and Delepine<sup>1</sup> measured the heat of solution in aqueous HCl.

$\text{Ag}_2\text{C}_2 \cdot \text{AgNO}_3$  (c). Berthelot and Delepine<sup>1</sup> measured the heat of solution in aqueous HCl.

$\text{Ag}_2\text{CO}_3$  (c). Berthelot's<sup>12</sup> data on the reaction of aqueous silver nitrate with aqueous potassium carbonate yield  $Q_f=117$  for the freshly precipitated silver carbonate, and  $Q_f=121$  for the crystallized material. The equilibrium data of Centnerszwer and Krustinson<sup>1</sup> on the reaction,  $\text{Ag}_2\text{CO}_3$  (c) =  $\text{Ag}_2\text{O}$  (c) +  $\text{CO}_2$  (g), yield, for  $\text{Ag}_2\text{CO}_3$  (c),  $Q_f=119.9$ .

$\text{Ag}_2\text{C}_2\text{O}_4$  (c). Berthelot<sup>10</sup> measured the heat of reaction of aqueous silver nitrate with aqueous potassium oxalate to be 14.6.

$\text{AgC}_2\text{H}_3\text{O}_2$  (aq.). Berthelot<sup>9</sup> reported a value for the heat of neutralization of silver oxide with aqueous acetic acid.

$\text{AgC}_2\text{H}_3\text{O}_2$  (c). The data on the heat of solution are: Berthelot,<sup>9</sup> -4.3; van Laar,<sup>10</sup> -4.41; Goldschmidt and van Maarsevenn,<sup>1</sup> -4.37. See also Rudolphi.<sup>1</sup>

$\text{AgCN}_2^-$  (aq.). The value for this substance is obtained from those for the aqueous salts.

$\text{AgCN}$  (c). Thomsen<sup>15</sup> measured the heats of the reactions,  $\text{AgNO}_3$  (200) +  $2 \text{KCN}$  (200) =  $(\text{KAg}(\text{CN})_2 + \text{KNO}_3)$  (600) and  $\text{KAg}(\text{CN})_2$  (600) +  $\text{AgNO}_3$  (200) =  $\text{KNO}_3$  (800) +  $2 \text{AgCN}$  (c); to be 33.21 and 20.22, respectively.

$\text{Ag}(\text{CN})_3^-$  (aq.). Varet<sup>5</sup> measured the heat of solution of silver cyanide in various aqueous cyanides.

$\text{AgCN} \cdot \text{NH}_3$  (c). Joannis and Crozier<sup>1</sup> reported  $D = -14.0$ .

$\text{AgCNO}$  (c). Lemoult<sup>1</sup> measured the heat of the reaction,  $\text{KCNO}$  (aq.) +  $\text{AgNO}_3$  (aq.) =  $\text{KNO}_3$  (aq.) +  $\text{AgCNO}$  (c), to be 13.46.

$\text{Ag}_2\text{CN}_2$  (c). Lemoult<sup>1</sup> measured the heat of solution in aqueous HCl.

$\text{AgONC}$  (c). Wohler and Martin<sup>1</sup> measured the heat of decomposition of silver fulminate into  $\text{Ag}$  (c) +  $\frac{1}{2} \text{N}_2$  (g) +  $\text{CO}$  (g) to be 69.6.

$\text{AgCNS}$  (c). Joannis<sup>1</sup> measured the heat of the reaction,  $\text{HCNS}$  (aq.) +  $\text{AgNO}_3$  (aq.) =  $\text{HNO}_3$  (aq.) +  $\text{AgCNS}$  (c), to be 22.44.

$\text{AgCNS}$  (aq.). Kirschner's<sup>1</sup> data on the temperature coefficient of the solubility yield -21.3 for the heat of solution.

$\text{AgX} \cdot \text{CH}_3\text{NH}_2$  (c). Jarry<sup>1</sup> obtained dissociation pressure data on

the monomethylamines of silver chloride, silver bromide, and silver iodide.

**AgI · PbI<sub>2</sub> (c).** Bellati and Romanese<sup>2</sup> measured the heat of transition.

**AgI · *n*CuI (c).** Bellati and Romanese<sup>2</sup> measured the heat of transition of these compounds with *n*=1 and 2.

**Ag<sub>3</sub>Hg<sub>4</sub> (c).** Data on the silver amalgams were reported by Berthelot<sup>123</sup> and Littleton.<sup>1</sup>

### GOLD

**Au (c).** Standard state.

**Au (liq.).** For the heat of fusion at its melting point, 1063°, Wust, Meuthen, and Durrer<sup>1</sup> reported -3.13 and Umino<sup>3</sup> -3.11.

**Au (g).** The vapor pressure data of Ruff and Bergdahl,<sup>1</sup> Tiede and Birnbauer,<sup>1</sup> and von Wartenberg<sup>3</sup> yield -86 for the heat of vaporization at 2611°. The energy states of gaseous monatomic gold are evaluated from the data of McLennan and McLay.<sup>1</sup>

**AuCl (c).** Fischer and Biltz<sup>1</sup> measured the heats of solution of Cl<sub>2</sub> (g), Au (c), and AuCl (c) in aqueous ICl<sub>3</sub> to be 7.1, 18.5, and 17.2, respectively; whence, for AuCl (c), *Qf*=8.4. The dissociation pressure data of Fischer and Biltz<sup>1</sup> and of Ephraim<sup>6</sup> yield, for AuCl (c), *Qf*=8.8 and 8.25, respectively. See also Matignon<sup>9</sup> and Meyer.<sup>1a</sup>

**AuCl<sub>3</sub> (c).** Fischer and Biltz<sup>1</sup> measured the heats of solution in aqueous ICl<sub>3</sub> of Cl<sub>2</sub> (g), Au (c), and AuCl<sub>3</sub> (c), and their data yield, for the latter, *Qf*=28.3. The dissociation pressure data of Fischer and Biltz,<sup>7</sup> Petit,<sup>2</sup> and Pellaton<sup>1</sup> yield, for AuCl<sub>3</sub> (c), *Qf*=28.1, 26.6, and 29.5.

**AuBr (c).** Fischer and Biltz<sup>1</sup> measured the heats of solution of Au (c), Br<sub>2</sub> (liq.), and AuBr (c) in aqueous ICl<sub>3</sub>, their data yielding, for AuBr (c), *Qf*=3.4. Thomsen<sup>15</sup> measured the heat of solution of AuBr (c) in HBr (aq.) to be 1.20 and in H<sub>2</sub>SO<sub>3</sub> (aq.) to be 21.38; whence, for AuBr (c), *Qf*=5.0 and 5.8. Fischer and Biltz<sup>1</sup> studied the equilibrium, AuBr (c) + Br<sub>2</sub> (g) = AuBr<sub>3</sub> (c), and found *Q*=17±2. See also Ephraim,<sup>6</sup> Meyer,<sup>1</sup> and Petersen.<sup>1, 2</sup>

**AuBr<sub>3</sub> (c).** Fischer and Biltz<sup>1</sup> measured the heats of solution of Au (c), Br<sub>2</sub> (liq.), and AuBr<sub>3</sub> (c) in aqueous ICl<sub>3</sub>, their data yielding, for AuBr<sub>3</sub> (c), *Qf*=14.5.

**AuBr<sub>3</sub> (aq.).** Thomsen<sup>15</sup> measured the heat of solution of AuBr<sub>3</sub> (c) to be -3.76<sub>200</sub>.

**AuCl<sub>3</sub> (aq.).** Thomsen<sup>15</sup> measured the heat of reaction of 2 AuCl<sub>3</sub> (1500) with 3 SO<sub>2</sub> (500) to be 83.60; whence, for AuCl<sub>3</sub> (aq.), *Qf*=29.78. Thomsen<sup>15</sup> measured the heat of solution of AuCl<sub>3</sub> in water to be 4.45<sub>900</sub>. Combination with Fischer and Biltz's<sup>1</sup> value for AuCl<sub>3</sub> (c) yield, for AuCl<sub>3</sub> (aq.), *Qf*=32.75.

**AuCl<sub>3</sub> · 2 H<sub>2</sub>O (c).** Fischer and Biltz<sup>1</sup> measured the heat of solution.

**HAuCl<sub>4</sub> (aq.).** Thomsen<sup>15</sup> and Fischer and Biltz<sup>1</sup> measured the heat of solution of AuCl<sub>3</sub> (c) in aqueous HCl to be 8.98 and 10.1, respectively. Using 28.3 as the value for AuCl<sub>3</sub> (c), one obtains, for HAuCl<sub>4</sub> (aq.),

$Q_f = 76.7$  and  $77.8$ . Thomsen<sup>15</sup> and Fischer and Biltz<sup>1</sup> measured the heat of the reaction,  $3 \text{ AuCl (c)} + \text{HCl (aq.)} = \text{HAuCl}_4 \text{ (aq.)} + 2 \text{ Au (c)}$ , to be  $5.0$  and  $13.5$ , respectively; whence, for  $\text{HAuCl}_4 \text{ (aq.)}$ ,  $Q_f = 69.4$  and  $77.8$ . Thomsen<sup>15</sup> explained the difference in his two values by assuming that the gold formed in the latter reaction has an energy content of about  $5$  greater than that of ordinary gold; but there is no other evidence to support this view.

$\text{HAuCl}_4 \cdot n\text{H}_2\text{O (c)}$ . Thomsen<sup>15</sup> measured the heats of solution of the tri- and tetrahydrates.

$\text{AuCl}_2 \text{ (c)}$ . Fischer and Biltz<sup>1</sup> and Petersen<sup>1, 2</sup> measured the heat of solution of this supposed compound to be, respectively,  $6.75$  in  $\text{HCl(100)}$  and  $5.15$  in  $\text{HCl(900)}$ . These data yield, for  $\text{AuCl}_2 \text{ (c)}$ ,  $Q_f = 18.1$  and  $19.7$ , respectively. One-half the sum of the values for  $\text{AuCl (c)}$  and  $\text{AuCl}_3 \text{ (c)}$  is  $18.3$ .

$\text{HAuBr}_4 \text{ (aq.)}$ . Thomsen<sup>15</sup> measured the heat of mixing  $\text{AuBr}_3 \text{ (aq.)}$  with  $\text{HBr (aq.)}$  to be  $7.70$ ; whence, for  $\text{HAuBr}_4 \text{ (aq.)}$ ,  $Q_f = 47.1$ .

$\text{HAuBr}_4 \cdot 5 \text{ H}_2\text{O (c)}$ . Thomsen<sup>15</sup> measured the heat of solution.

$\text{AuI (c)}$ . Thomsen<sup>15</sup> measured the heat of the reaction,  $\text{AuCl}_3 \text{ (aq.)} + 3 \text{ KI (aq.)} = \text{AuI (c)} + 3 \text{ KCl (aq.)} + \text{I}_2 \text{ (c)}$ , to be  $45.66$ ; whence, for  $\text{AuI (c)}$ ,  $Q_f = -0.3$ . Thomsen<sup>15</sup> also measured the heat of the reaction of aurous iodide with aqueous sulfur dioxide. Fischer and Biltz<sup>1</sup> measured the heats of solution in aqueous  $\text{ICl}_3$  of  $\text{Au (c)}$ ,  $\text{I}_2 \text{ (c)}$ , and  $\text{AuI (c)}$ , and their data yield, for  $\text{AuI (c)}$ ,  $Q_f = -0.2$ .

$\text{Au(OH)}_3 \text{ (c)}$ . Thomsen<sup>15</sup> measured the heat of solution in  $4 \text{ HBr (aq.)}$  and in  $4 \text{ HCl (aq.)}$ .

$\text{Au}_2\text{O}_3 \text{ (c)}$ . Mixer's<sup>12</sup> data on the heats of the reactions of  $3 \text{ Na}_2\text{O}_2 \text{ (c)}$  with  $2 \text{ Au (c)}$  and with  $\text{Au}_2\text{O}_3 \text{ (c)}$ , yield, for the latter,  $Q_f = -11$ .

$\text{AuH (g)}$ . From band spectra, Bengtsson and Hulthen<sup>1</sup> calculated  $D^\circ = -103.5$ . See also Farkas.<sup>1</sup>

$\text{Au(CN)}_2^- \text{ (aq.)}$ . Biltz<sup>6a, 6b</sup> measured the heats of solution of  $\text{AuI (c)}$ ,  $\text{AuBr (c)}$ , and  $\text{AuCl (c)}$  in aqueous cyanide solutions, and his data yield, for  $\text{Au(CN)}_2^- \text{ (aq.)}$ ,  $Q_f = -58.0$ ,  $-56.8$ , and  $-57.5$ .

$\text{AuHg}_{100} \text{ (liq.)}$ . Data on the heat of formation of gold amalgam were reported by Biltz and Meyer<sup>2</sup> and Tammann and Ohler,<sup>1</sup> who found, for  $\text{AuHg}_{100} \text{ (liq.)}$ ,  $Q_f = -1.3$  and  $-2.0$ , respectively.

$\text{AuAgCl}_2 \text{ (c)}$ . We have estimated the heat of formation of this substance from  $\text{AgCl (c)}$  and  $\text{AuCl (c)}$  to be zero.

$\text{AuAgCl}_4 \text{ (c)}$ . Parravano and Malquori<sup>3</sup> studied the equilibrium,  $\text{AuAgCl}_4 \text{ (c)} = \text{Cl}_2 \text{ (g)} + \text{AuAgCl}_2 \text{ (c)}$ , and calculated  $Q = 18.6$ .

$\text{AuCl} \cdot n\text{NH}_3 \text{ (c)}$ . Biltz<sup>6a, 6b</sup> measured the heats of solution of the mono- and diammines in aqueous KCN, and obtained dissociation pressure data on the di- and hexammines. Ephraim<sup>6</sup> measured the dissociation pressures of the diammine.

$\text{AuBr} \cdot n\text{NH}_3 \text{ (c)}$ . Biltz<sup>6a, 6b</sup> measured the heats of solution of the mono- and diammines in aqueous KCN, and obtained dissociation pressure data on the di-, tri-, tetra-, and hexammines.

**AuI · nNH<sub>3</sub> (c).** Biltz<sup>6a, 6b</sup> measured the heat of solution of the monoammine, and obtained dissociation pressure data on the di-, tri-, hexa-, and octammines.

#### PLATINUM

**Pt (c).** Standard state.

**Pt (g).** Jones, Langmuir, and Mackay<sup>1</sup> calculated the heat of sublimation of platinum to be -127, from the rate of loss of the metal from a hot platinum wire. See also Langmuir and Mackay<sup>2</sup> and van Liempt.<sup>2</sup> The energy states of gaseous monatomic platinum have been evaluated from the data of Livingood.<sup>1</sup>

**Pt (liq.).** Violle<sup>1</sup> measured the heat of fusion.

**H<sub>2</sub>PtCl<sub>6</sub> (aq.).** Thomsen's<sup>15</sup> data on the heat of neutralization of H<sub>2</sub>PtCl<sub>6</sub> (600) with 2 NaOH (300) yield  $Q = 27.02$ ; whence, for H<sub>2</sub>PtCl<sub>6</sub> (600),  $Q_f = 166.2$ . Pigeon's<sup>1</sup> data on the reaction of H<sub>2</sub>PtCl<sub>6</sub> (aq.) with solid cobalt yield, for H<sub>2</sub>PtCl<sub>6</sub> (aq.),  $Q_f = 152.7$ , which value is quite divergent. Pigeon<sup>1</sup> measured the heats of the following reactions: PtCl<sub>4</sub> (aq.) + 2 Co (c) = 2 CoCl<sub>2</sub> (aq.) + Pt (c),  $Q = 110.1$ ; PtCl<sub>4</sub> (c) = PtCl<sub>4</sub> (aq.),  $Q = 19.56$ ; PtCl<sub>4</sub> (c) + 2 HCl (aq.) = H<sub>2</sub>PtCl<sub>6</sub> (aq.),  $Q = 24.8$ . Combination of these data yields, for H<sub>2</sub>PtCl<sub>6</sub> (aq.),  $Q_f = 165.6$ . Combination of Thomsen's<sup>15</sup> data on the heat of the reaction, Na<sub>2</sub>PtCl<sub>6</sub> (aq.) + 2 CuCl (c) = (Na<sub>2</sub>PtCl<sub>4</sub> + 2 CuCl<sub>2</sub>) (aq.), with his data on the heat of neutralization of H<sub>2</sub>PtCl<sub>6</sub> (aq.) with 2 NaOH (aq.) yields, for H<sub>2</sub>PtCl<sub>6</sub> (aq.),  $Q_f = 166.1$ .

**PtCl<sub>6</sub><sup>-</sup> (aq.).** The value for this substance is obtained from those for the aqueous sodium and potassium salts. Miller and Terrey<sup>1</sup> obtained electromotive force data on the cell reaction, 2 Hg (liq.) + PtCl<sub>6</sub><sup>-</sup> (aq.), = 2 HgCl (c) + PtCl<sub>4</sub><sup>-</sup> (aq.), which give  $Q = 21.71$ ; whence, for the reaction, PtCl<sub>4</sub><sup>-</sup> (aq.) + Cl<sub>2</sub> (g) = PtCl<sub>6</sub><sup>-</sup> (aq.),  $Q = 41.4$ .

**HPtCl<sub>5</sub> · 2 H<sub>2</sub>O (c).** Pigeon<sup>1</sup> measured the heat of solution in aqueous HCl.

**H<sub>2</sub>PtCl<sub>6</sub> · 6 H<sub>2</sub>O (c).** Pigeon<sup>1</sup> measured the heat of solution in aqueous HCl.

**H<sub>2</sub>PtCl<sub>4</sub> (aq.).** The heat of neutralization of H<sub>2</sub>PtCl<sub>4</sub> (aq.) with 2 NaOH (aq.) is assumed to be the same as that for H<sub>2</sub>PtCl<sub>6</sub> (aq.).

**PtCl<sub>4</sub><sup>-</sup> (aq.).** This value is obtained from those for the aqueous sodium and potassium salts.

**PtCl<sub>n</sub> (c).** Pigeon<sup>1</sup> measured the heat of solution of PtCl<sub>4</sub> (c) in water to be 19.56, and in 2 HCl (aq.) to be 24.8. Wohler and Streicher<sup>2</sup> obtained dissociation pressure data on PtCl (c), PtCl<sub>2</sub> (c), PtCl<sub>3</sub> (c), and PtCl<sub>4</sub> (c).

**PtCl<sub>4</sub> · 5 H<sub>2</sub>O (c).** Pigeon<sup>1</sup> measured the heat of solution.

**Pt(OH)<sub>2</sub> (c).** Thomsen<sup>15</sup> measured the heat of reduction of this substance with aqueous formic acid to be 48.3; whence, for Pt(OH)<sub>2</sub> (c),  $Q_f = 87.5$ .

**H<sub>2</sub>PtBr<sub>6</sub> (aq.).** Pigeon's<sup>1</sup> data on the reactions of PtBr<sub>4</sub> (aq.) with 2 Co (c), of PtBr<sub>4</sub> (c) with water, and of PtBr<sub>4</sub> (c) with 2 HBr (aq.),

yield, for  $\text{H}_2\text{PtBr}_6$  (aq.),  $Qf=119.8$ . Thomsen's<sup>15</sup> data on the platinous salts together with the heat of oxidation with liquid bromine yield  $Qf=115.3$ . From the values for  $\text{Na}_2\text{PtBr}_6$  (aq.) and  $\text{K}_2\text{PtBr}_6$  (aq.) and the heat of neutralization of  $\text{H}_2\text{PtBr}_6$  (aq.) with 2  $\text{NaOH}$  (aq.) or 2  $\text{KOH}$  (aq.) (assumed to be the same as that for  $\text{H}_2\text{PtCl}_6$  (aq.)), one obtains, for  $\text{H}_2\text{PtBr}_6$  (aq.),  $Qf=116.2$  and  $115.5$ .

$\text{PtBr}_6^{--}$  (aq.). This value is obtained from those for the aqueous sodium and potassium salts.

$\text{H}_2\text{PtBr}_6 \cdot 9 \text{H}_2\text{O}$  (c). Pigeon<sup>1</sup> measured the heat of solution.

$\text{PtBr}_4$  (aq.). Pigeon<sup>1</sup> measured the heat of reduction of this substance with 2  $\text{Co}$  (c) to be 93.5.

$\text{PtBr}_4$  (c). Pigeon<sup>1</sup> measured the heat of solution of this substance in water to be 9.86, and in 2  $\text{HBr}$  (aq.) to be 18.27.

$\text{PtBr}_4^{--}$  (aq.). The value for this substance is obtained from that for  $\text{K}_2\text{PtBr}_4$  (aq.).

$\text{PtI}_4$  (c). Pigeon<sup>1</sup> measured the heat of reaction of this substance with 2  $\text{NaI}$  (aq.) to be 7.3.

$\text{PtI}_6^{--}$  (aq.). This value is obtained from that for  $\text{Na}_2\text{PtI}_6$  (aq.).

$\text{PtS}$  (c),  $\text{PtS}_2$  (c). Biltz and Jirsa<sup>1</sup> obtained dissociation pressure data on these sulfides.

$\text{Pt}(\text{NH}_3)_4\text{Cl}_2 \cdot \text{H}_2\text{O}$  (c). We have estimated the heat of formation of this hydrate from that for  $\text{PtCl}_2 \cdot 4 \text{NH}_3$  (c).

$\text{Pt}(\text{NH}_3)_4\text{Cl}_2$  (aq.). Thomsen<sup>15</sup> measured the heat of solution of  $\text{Pt}(\text{NH}_3)_4\text{Cl}_2 \cdot \text{H}_2\text{O}$  (c) in water.

$\text{Pt}(\text{NH}_3)_4(\text{OH})_2$  (aq.). Thomsen<sup>15</sup> measured the heat of reaction of this substance with 2  $\text{HCl}$  (aq.) to be 27.3.

$\text{Pt}(\text{NH}_3)_4\text{SO}_4$  (aq.). Thomsen<sup>15</sup> measured the heat of reaction of  $\text{Pt}(\text{NH}_3)_4(\text{OH})_2$  (aq.) with  $\text{H}_2\text{SO}_4$  (aq.) to be 30.85.

$(\text{NH}_4)_2\text{PtCl}_4$  (aq.). The value for this substance is obtained from those for  $\text{NH}_4^+$  (aq.) and  $\text{PtCl}_4^{--}$  (aq.).

$(\text{NH}_4)_2\text{PtCl}_4$  (c). Thomsen<sup>15</sup> measured the heat of solution.

$\text{PtCl}_2 \cdot n\text{NH}_3$  (c). Isambert<sup>1</sup> reported a value for the heat of formation of the diammine. Ephraim and Millman<sup>1</sup> obtained dissociation pressure data on the tetra- and pentammines.

$\text{PtI}_2 \cdot n\text{NH}_3$  (c). Ephraim and Millman<sup>1</sup> obtained dissociation pressure data on the tetra- and hexammines.

$\text{Ag}_2\text{PtCl}_6$  (c). Pigeon<sup>1</sup> measured the heat of reaction of  $\text{H}_2\text{PtCl}_6$  (aq.) with 2  $\text{AgNO}_3$  (aq.) to be 14.55.

$\text{Ag}_2\text{PtBr}_6$  (c). Pigeon<sup>1</sup> measured the heat of reaction of  $\text{H}_2\text{PtBr}_6$  (aq.) with 2  $\text{AgNO}_3$  (aq.) to be 32.0.

$[\text{Pt} \cdot 6 \text{NH}_3]^{+++}$  (aq.),  $[\text{Pt} \cdot 5 \text{NH}_3 \cdot \text{NH}_2]^{+++}$  (aq.),  $[\text{Pt} \cdot 5 \text{NH}_3 \cdot \text{Cl}]^{+++}$  (aq.),  $[\text{Pt} \cdot 4 \text{NH}_3 \cdot \text{NH}_2 \cdot \text{Cl}]^{++}$  (aq.). See Grunberg and Faermann.<sup>1</sup>

**Ir** (c). Standard state. **IRIDIUM**

**Ir** (g). We have estimated the heat of sublimation to be  $-120$ . See Meggers and Laporte<sup>1</sup> for the energy states of gaseous monatomic iridium.

**IrO<sub>2</sub> (c).** From their vapor pressure data, Wohler and Witzmann<sup>1</sup> calculated  $Qf=50$ ; Biltz<sup>1</sup> computed  $Qf=52$  from the same data.

**IrCl<sub>n</sub> (c).** Wohler and Streicher<sup>1</sup> obtained dissociation pressure data on IrCl (c), IrCl<sub>2</sub> (c), and IrCl<sub>3</sub> (c).

**IrCl<sub>6</sub><sup>-</sup> (aq.).** The value for this substance is obtained from those for K<sub>2</sub>IrCl<sub>6</sub> (aq.) and K<sup>+</sup> (aq.).

**IrCl<sub>6</sub><sup>-</sup> (aq.).** The values for K<sub>3</sub>IrCl<sub>6</sub> (aq.) and K<sup>+</sup> (aq.) yield, for IrCl<sub>6</sub><sup>-</sup> (aq.),  $Qf=187.2$ . The electromotive force data of Terrey and Baker<sup>1</sup> on the cell reaction, Hg (liq.) + Cl<sup>-</sup> (aq.) + IrCl<sub>6</sub><sup>-</sup> (aq.) = HgCl (c) + IrCl<sub>6</sub><sup>-</sup> (aq.), yield  $Q=25.7$ ; whence, for IrCl<sub>6</sub><sup>-</sup> (aq.),  $Qf=186.3$ .

**IrF<sub>6</sub> (liq.).** For the heat of formation of this substance, Ruff and Fischer<sup>1</sup> reported the approximate value 130.

**IrF<sub>6</sub> (g).** Ruff and Fischer<sup>1</sup> reported  $V=-8.50$ .

#### OSMIUM

**Os (c).** Standard state.

**Os (g).** We have estimated the heat of sublimation to be  $-125$ . See Meggers and Laporte<sup>1</sup> concerning the energy states of gaseous monatomic osmium.

**OsO<sub>4</sub> (c).** von Wartenberg<sup>1</sup> determined the heat of combustion of osmium to form the tetroxide.

**OsO<sub>4</sub> (liq.).** von Wartenberg<sup>1</sup> found the heat of fusion to be  $-3.41$  at  $40^\circ$ .

**OsO<sub>4</sub> (g).** von Wartenberg's<sup>1</sup> data yield  $-13.5$  for the heat of sublimation of solid osmium tetroxide.

#### RHENIUM

**Re (c).** Standard state.

**ReO<sub>3</sub> (c), Re<sub>2</sub>O<sub>7</sub> (c).** Roth and Becker<sup>4, 5</sup> measured the heat of combustion of rhenium (97.9 to 98.9% pure) in oxygen to form a mixture of the two oxides. The amount of rhenium burned to the lower oxide ranged from 1.5 to 13.8%, and that to the higher oxide ranged from 86 to 98%. These investigators calculated, for Re<sub>2</sub>O<sub>7</sub> (c),  $Qf=297.5 \pm 2.0$ , and for ReO<sub>3</sub> (c),  $Qf=82.5 \pm 8.0$ .

**HReO<sub>4</sub> (aq.).** Roth and Becker<sup>4</sup> measured the heat of solution of Re<sub>2</sub>O<sub>7</sub> (c) in water at  $20^\circ$  at concentrations ranging from 9370 to 46,350 H<sub>2</sub>O. For 9370 H<sub>2</sub>O,  $Q=11.23$ , whence, for HReO<sub>4</sub>(4700),  $Qf=222.73$ .

We have estimated values for the heat of dilution of aqueous HReO<sub>4</sub> from the above data of Roth and Becker.

**ReO<sub>4</sub><sup>-</sup> (aq.).** This value is obtained from that for HReO<sub>4</sub> ( $\infty$ ).

#### PALLADIUM

**Pd (c).** Standard state.

**Pd (g).** We have estimated the heat of sublimation. The values for the energy states of gaseous monatomic palladium are from McLennan and Smith<sup>1</sup> and Shenstone.<sup>1c, 4</sup>

**Pd (liq.).** Violle<sup>1a</sup> measured the heat of fusion.

**PdO (c).** Biltz<sup>8</sup> computed the heat of formation of this substance from the dissociation pressure data of Wohler.<sup>1</sup>

**Pd<sub>2</sub>H (c).** The data on the heat of formation of this compound are: Gillespie and Hall,<sup>1</sup> 8.86; Gillespie and Ambrose,<sup>1</sup> 9.28; Favre,<sup>9</sup> 8.9. See also Moutier.<sup>1</sup>

**Pd(OH)<sub>2</sub> (c).** Thomsen<sup>15</sup> measured the heat of reaction of Na<sub>2</sub>PdCl<sub>4</sub> (aq.) with 2 NaOH (aq.) to be 12.55; Joannis<sup>4</sup> measured the heat of reaction of K<sub>2</sub>PdBr<sub>4</sub> (aq.) with 2 KOH (aq.) to be 9.02. These data yield, for Pd(OH)<sub>2</sub> (c),  $Q_f = 90.7$  and  $89.1$ , respectively.

**Pd(OH)<sub>4</sub> (c).** Thomsen<sup>15</sup> measured the heat of reaction of K<sub>2</sub>PdCl<sub>6</sub> (aq.) with 4 NaOH (aq.) to be 18.01; whence, for Pd(OH)<sub>4</sub> (c),  $Q_f = 155.0$ .

**PdCl<sub>2</sub> (c).** Joannis<sup>4</sup> found  $Q = 4.72$  for the reaction, PdCl<sub>2</sub> (c) + 2 KCl (aq.) = K<sub>2</sub>PdCl<sub>4</sub> (aq.); while, for that with 2 HCl (aq.), Thomsen<sup>15</sup> found  $Q = 4.0$ . These data yield, for PdCl<sub>2</sub> (c),  $Q_f = 43.5$  and  $44.2$ , respectively.

**PdCl<sub>4</sub><sup>-</sup> (aq.).** This value is obtained from that for K<sub>2</sub>PdCl<sub>4</sub> (aq.).

**PdCl<sub>6</sub><sup>-</sup> (aq.).** This value is obtained from that for K<sub>2</sub>PdCl<sub>6</sub> (aq.).

**H<sub>2</sub>PdCl<sub>6</sub> (aq.).** We have assumed the heat of ionization to be zero.

**H<sub>2</sub>PdCl<sub>4</sub> (aq.).** Thomsen<sup>15</sup> measured the heat of neutralization of this acid with 2 NaOH (aq.) to be 27.25.

**PdBr<sub>2</sub> (c).** Joannis<sup>4</sup> reported  $Q_f = 24.9$ .

**PdBr<sub>4</sub><sup>-</sup> (aq.).** This value is obtained from that for K<sub>2</sub>PdBr<sub>4</sub> (aq.).

**PdI<sub>2</sub> · H<sub>2</sub>O (c).** Joannis<sup>4</sup> measured the heat of reaction of K<sub>2</sub>PdBr<sub>4</sub> (aq.) with 2 KI (aq.) to form PdI<sub>2</sub> · H<sub>2</sub>O (c) + 4 KBr (aq.) to be 18.40. For the reaction of K<sub>2</sub>PdCl<sub>4</sub> (aq.) with 2 KI (aq.), Thomsen<sup>15</sup> found  $Q = 22.56$ . These data yield, for PdI<sub>2</sub> · H<sub>2</sub>O (c),  $Q_f = 84.3$  and  $86.5$ .

**PdI<sub>2</sub> (c).** We have estimated the heat of dissociation of the monohydrate.

**Pd(CN)<sub>2</sub> (c).** Joannis<sup>4</sup> measured the heat of reaction of K<sub>2</sub>PdBr<sub>4</sub> (aq.) with 2 KCN (aq.) to be 47.14; whence, for Pd(CN)<sub>2</sub> (c),  $Q_f = -51.7$ .

**PdX<sub>2</sub> · nNH<sub>3</sub> (c).** Isambert<sup>6</sup> reported values for the heats of formation of the di- and tetrammines of the chloride and bromide.

## RHODIUM

**Rh (c).** Standard state.

**Rh (g).** We have estimated the heat of sublimation. The values for the energy states of gaseous monatomic rhodium are from Bacher and Goudsmit.<sup>1</sup>

**Rh<sub>n</sub>O<sub>m</sub> (c).** Wohler and Muller<sup>2</sup> obtained dissociation pressure data on RhO (c), Rh<sub>2</sub>O (c), and Rh<sub>2</sub>O<sub>3</sub> (c), from which we have estimated the heats of formation.

**RhCl<sub>n</sub> (c).** Wohler and Muller<sup>2</sup> obtained dissociation pressure data on RhCl (c), RhCl<sub>2</sub> (c), and RhCl<sub>3</sub> (c), from which we have estimated the heats of formation.

**RhCl<sub>6</sub><sup>-</sup> (aq.).** The value for this substance is obtained from that for Na<sub>3</sub>RhCl<sub>6</sub> (aq.).

## RUTHENIUM

**Ru (c).** Standard state.

**Ru (g).** We have estimated the heat of sublimation. The values for the energy states of gaseous monatomic ruthenium are from Bacher and Goudsmit.<sup>1</sup>

**RuO<sub>2</sub> (c).** Remy and Kohn<sup>1</sup> obtained dissociation pressure data on this substance.

**RuCl<sub>3</sub> (c).** Remy and Kohn<sup>1</sup> obtained dissociation pressure data on RuCl<sub>3</sub> (c). See also Wohler and Balz.<sup>1</sup>

## MASURIUM

**Ma (c).** Standard state.

## NICKEL

**Ni (c, III).** Standard state.

**Ni (c, II).** For the heat of transition at the Curie point, 360°, the data are: Weiss, Piccard, and Carard,<sup>1</sup> -0.17; Laschtschenko,<sup>2</sup> -0.12; Wust, Meuthen, and Durrer,<sup>1</sup> -0.08; Umino,<sup>4</sup> -0.12; Laschtschenko,<sup>5</sup> -0.18. See also Pionchon,<sup>2</sup> Werner,<sup>1</sup> and Klinkhardt.<sup>1</sup>

**Ni (c, I).** There is supposed to be a transition at about 1130°, but the heat effect must be small as it has not been observed.

**Ni (liq.).** For the heat of fusion of nickel at 1452°, White<sup>1</sup> reported -4.34 and Umino<sup>4</sup> -4.07.

**Ni (g).** Jones, Langmuir, and Mackay<sup>1</sup> calculated the heat of sublimation of nickel to be -89.4; Millar<sup>1</sup> calculated the value -88.2; we have estimated the value -85.0. The energy states of gaseous monatomic nickel are evaluated from the data of Russell,<sup>6</sup> Menzies,<sup>4</sup> and Shenstone.<sup>2</sup>

**NiO (c).** The data on the heat of combustion of nickel to form NiO (c) are: Roth,<sup>5</sup> 58.9; Mixter,<sup>11</sup> 57.9; Ruff and Gersten,<sup>4</sup> 53; Dulong,<sup>2</sup> 59.7. Equilibrium data involving NiO (c) were obtained by Treadwell,<sup>1</sup> Watanabe,<sup>1b</sup> Pease and Cook,<sup>1</sup> Skapski and Dabrowski.<sup>1</sup> See also Wohler and Balz<sup>2</sup> and Foote and Smith.<sup>1</sup>

**Ni(OH)<sub>2</sub> (c, ppt.).** Thomsen<sup>15</sup> measured the heat of the reactions of NiSO<sub>4</sub>(400) with Ba(OH)<sub>2</sub>(400) and of NiSO<sub>4</sub>(100) with 2 NaOH (100) to be 10.63 and 5.33, respectively; whence, for Ni(OH)<sub>2</sub> (c, ppt.)  $Q_f = 129.8$  and  $129.8$ . Giordani and Mattias<sup>1, 8</sup> measured the heat of solution of Ni(OH)<sub>2</sub> (c) in aqueous HCl and in aqueous H<sub>2</sub>SO<sub>4</sub> to be 20.65 and 22.16, respectively; whence, for Ni(OH)<sub>2</sub> (c),  $Q_f = 131$  and  $133$ .

**Ni(OH)<sub>3</sub> (c, ppt.).** Thomsen<sup>15</sup> measured the heat of the reaction, 2 NiCl<sub>2</sub> (aq.) + NaOCl (aq.) + H<sub>2</sub>O (liq.) + 4 NaOH (aq.) = 2 Ni(OH)<sub>3</sub> (c, ppt.) + 5 NaCl (aq.), and his data yield, for Ni(OH)<sub>3</sub> (c, ppt.),  $Q_f = 163.2$ . Giordani and Mattias<sup>1, 8</sup> measured the heat of solution of Ni(OH)<sub>3</sub> (c) in aqueous H<sub>2</sub>SO<sub>4</sub> to be 39.7.

**NiF<sub>2</sub> (aq.).** Petersen<sup>1</sup> measured the heat of reaction of NiCl<sub>2</sub> (aq.) with 2 AgF (aq.) to be 31.71; whence, for NiF<sub>2</sub> (aq.),  $Q_f = 171.4$ . Mulert<sup>1</sup>

measured the heat of solution of  $\text{Ni}(\text{OH})_2(\text{c})$  in aqueous (20%)  $\text{HF}$  to be 28.0.

$\text{NiF}_2(\text{c})$ . The equilibrium data of Jellinek and Rudat<sup>1</sup> on the reaction,  $\text{NiF}_2(\text{c}) + \text{H}_2(\text{g}) = 2\text{HF}(\text{g}) + \text{Ni}(\text{c})$ , yield, for  $\text{NiF}_2(\text{c})$ ,  $Q_f^{\text{600}} = 157.5$ .

$\text{NiCl}_2(\text{aq.})$ . Thomsen<sup>15</sup> found  $Q = 15.17$  for the heat of solution of  $\text{Ni}(\text{c})$  in  $2\text{HCl}(400)$ ; whence, for  $\text{NiCl}_2(800)$ ,  $Q_f = 94.23$ . Data on the heat of dilution of aqueous  $\text{NiCl}_2$  were reported by Thomsen.<sup>15</sup>

$\text{NiCl}_2(\text{c})$ . Thomsen<sup>15</sup> measured the heat of solution.

$\text{NiCl}_2 \cdot \text{H}_2\text{O}(\text{c})$ . Sabatier<sup>2</sup> measured the heat of solution.

$\text{NiCl}_2 \cdot 4\text{H}_2\text{O}(\text{c})$ . Dissociation pressure data on the system, hexahydrate-tetrahydrate-water vapor, were obtained by Derby and Yngve<sup>1</sup> and Lescoeur.<sup>2</sup>

$\text{NiCl}_2 \cdot 6\text{H}_2\text{O}(\text{c})$ . Thomsen<sup>15</sup> measured the heat of solution. See also Berger and Crut,<sup>1</sup> Jellinek and Podjaski,<sup>1</sup> and Jellinek and Uloth<sup>1</sup> for equilibrium data.

$\text{Ni}^{++}(\text{aq.})$ . This value is obtained from that for  $\text{NiCl}_2(\text{aq.})$ .

$\text{NiBr}_2(\text{aq.})$ . From the values for the aqueous ions, we have computed, for  $\text{NiBr}_2(\text{aq.})$ ,  $Q_f = 72.4$ . Fabre<sup>1</sup> reported the value 72.4.

$\text{NiBr}_2(\text{c})$ . Crut<sup>1</sup> measured the heat of solution. See also his equilibrium data.

$\text{NiBr}_2 \cdot 3\text{H}_2\text{O}(\text{c})$ . Crut<sup>1</sup> measured the heat of solution.

$\text{NiI}_2(\text{aq.})$ . This value is obtained from the ions.

$\text{NiI}_2(\text{c})$ . Mosnier<sup>1</sup> measured the heat of solution.

$\text{NiS}(\text{c})$ . Thomsen<sup>15</sup> measured the heat of reaction of  $\text{NiSO}_4(400)$  with  $\text{Na}_2\text{S}(400)$  to be 15.08.

$\text{NiSO}_4(\text{aq.})$ . Thomsen<sup>15</sup> measured the heat of the reaction of  $\text{NiCl}_2(200)$  with  $\text{H}_2\text{SO}_4(200)$ , and of  $\text{NiSO}_4(200)$  with  $2\text{HCl}(100)$ , to be 1.13 and 3.19, respectively; whence, for  $\text{NiSO}_4(200)$ ,  $Q_f = 231.1$ .

$\text{NiSO}_4(\text{c})$ . We have estimated the heat of solution of this substance.

$\text{NiSO}_4 \cdot 7\text{H}_2\text{O}(\text{c})$ . Thomsen<sup>15</sup> measured the heat of solution. See also Lescoeur.<sup>8</sup>

$\text{NiS}_2\text{O}_6(\text{aq.})$ . The value for this substance is obtained from those for the ions.

$\text{NiS}_2\text{O}_6 \cdot 6\text{H}_2\text{O}(\text{c})$ . Thomsen<sup>15</sup> measured the heat of solution.

$\text{NiSe}(\text{c})$ . Fabre<sup>1</sup> measured the heat of reaction of  $\text{NiSe}(\text{c})$  with bromine water, and of  $\text{NiSO}_4(\text{aq.})$  with  $\text{Na}_2\text{Se}(\text{aq.})$ , to be 101.2 and 35.7, respectively; whence, for  $\text{NiSe}(\text{c})$ ,  $Q_f = 12$  and 14.

$\text{NiTe}(\text{c})$ . Fabre<sup>3</sup> measured the heat of reaction of  $\text{NiTe}(\text{c})$  with bromine water to be 115.5.

$\text{NiN}_6 \cdot \text{H}_2\text{O}(\text{c})$ . Wohler and Martin<sup>1</sup> measured the heat of decomposition of this substance to be 89.5, the products being solid nickel, gaseous nitrogen, and gaseous water.

$\text{Ni}(\text{NO}_3)_2(\text{aq.})$ . This value is obtained from those for the ions.

$\text{Ni}(\text{NO}_3)_2(\text{c})$ . Guntz and Martin<sup>1</sup> measured the heat of solution.

$\text{Ni}(\text{NO}_3)_2 \cdot 6\text{H}_2\text{O}(\text{c})$ . Thomsen<sup>15</sup> measured the heat of solution.

$\text{Ni}(\text{NO}_3)_2 \cdot 6 \text{H}_2\text{O}$  (liq.). Reisenfeld and Milchsach<sup>1</sup> determined the heat of fusion of the hexahydrate to be  $-10.6$  at  $60^\circ$ .

$\text{NiX}_2 \cdot n \text{NH}_3$  (c). Ephraim<sup>1, 2, 8, 9</sup> and Ephraim and Jahnsen<sup>1</sup> obtained dissociation pressure data on the hexammines of  $\text{NiCl}_2$ ,  $\text{NiBr}_2$ , and  $\text{NiI}_2$ . Biltz and Fetkenheuer,<sup>1, 2</sup> Biltz,<sup>4, 9</sup> and Biltz and Hüttig<sup>2</sup> obtained dissociation pressure data on the mono-, di-, and hexammines of  $\text{NiCl}_2$  and  $\text{NiBr}_2$  and on the di- and hexammines of  $\text{NiI}_2$ , and measured the following heats of solution:  $\text{NiCl}_2 \cdot 6 \text{NH}_3$  (c),  $44.3$  in  $\text{HCl}$  (aq.),  $9.8$  in  $\text{NH}_3$  (aq.);  $\text{NiCl}_2 \cdot 2 \text{NH}_3$  (c),  $19.5$  in  $\text{HCl}$  (aq.),  $13.9$  in  $\text{NH}_3$  (aq.);  $\text{NiCl}_2 \cdot \text{NH}_3$  (c),  $17.8$  in  $\text{HCl}$  (aq.),  $24.3$  in  $\text{NH}_3$  (aq.);  $\text{NiCl}_2$  (c),  $18.7$  in  $\text{HCl}$  (aq.).

$\text{Ni}(\text{NO}_2)_2 \cdot 5 \text{NH}_3$  (c). Ephraim<sup>2</sup> measured the dissociation pressures.

$\text{Ni}(\text{NO}_3)_2 \cdot 6 \text{NH}_3$  (c). Ephraim<sup>2</sup> measured the dissociation pressures.

$\text{NiF}_2 \cdot \text{H}_2\text{O} \cdot n \text{NH}_3$  (c). Biltz and Rahlfs<sup>2</sup> obtained dissociation pressure data on the penta- and monoammines.

$\text{Ni}(\text{ClO}_3)_2 \cdot 6 \text{NH}_3$  (c). Ephraim<sup>2</sup> and Ephraim and Jahnsen<sup>1</sup> measured the dissociation pressures.

$\text{Ni}(\text{ClO}_4)_2 \cdot 6 \text{NH}_3$  (c). Ephraim<sup>2</sup> measured the dissociation pressures.

$\text{Ni}(\text{IO}_3)_2 \cdot 5 \text{NH}_3$  (c). Ephraim and Jahnsen<sup>1</sup> measured the dissociation pressures.

$\text{NiSO}_4 \cdot n \text{NH}_3$  (c). Ephraim<sup>2, 8</sup> obtained dissociation pressure data on the ammines with  $\frac{1}{2}$ ,  $2$ ,  $4$ , and  $6 \text{NH}_3$ .

$\text{NiS}_2\text{O}_6 \cdot n \text{NH}_3$  (c). Ephraim<sup>2</sup> measured the dissociation pressures of the penta- and hexammines.

$\text{NiS}_4\text{O}_6 \cdot 6 \text{NH}_3$  (c). Ephraim<sup>2</sup> measured the dissociation pressures.

$\text{Ni}(\text{H}_2\text{PO}_2)_2 \cdot 6 \text{NH}_3$  (c). Ephraim<sup>2</sup> measured the dissociation pressures.

$\text{Ni}(\text{COOH})_2 \cdot 4 \text{NH}_3$  (c). Ephraim<sup>2</sup> measured the dissociation pressures.

$\text{Ni}(\text{C}_2\text{H}_3\text{O}_2)_2 \cdot 4 \text{NH}_3$  (c). Ephraim<sup>2</sup> measured the dissociation pressures.

$\text{Ni}(\text{CNS})_2 \cdot 6 \text{NH}_3$  (c). Ephraim<sup>2</sup> measured the dissociation pressures.

$\text{Ni}(\text{NH}_4)_2(\text{SO}_4)_2 \cdot 6 \text{H}_2\text{O}$  (c). Caven and Ferguson<sup>2</sup> measured the dissociation pressures of the system, hexahydrate-dihydrate-water vapor.

$\text{NiC}_3$  (c). Roth's<sup>5</sup> data on the heat of combustion of nickel carbide yield  $Q_f = -9.2$ . See also Ruff and Gersten.<sup>2</sup>

$\text{Ni}(\text{CO})_4$  (liq.). From his vapor pressure data, Anderson<sup>2</sup> calculated the heat of vaporization.

$\text{Ni}(\text{CN})_2$  (c, ppt.). Varet<sup>4, 5</sup> measured the heats of the reactions of  $\text{NiSO}_4$  (aq.) with  $2 \text{KCN}$  (aq.),  $\text{NiSO}_4$  (aq.) with  $2 \text{NaCN}$  (aq.),  $\text{Ni}(\text{NO}_3)_2$  (aq.) with  $2 \text{KCN}$  (aq.), and  $\text{Ni}(\text{NO}_3)_2$  (aq.) with  $2 \text{NaCN}$  (aq.) to be  $31.6$ ,  $31.4$ ,  $31.0$ , and  $30.9$ , respectively.

**Ni (CN)<sub>4</sub><sup>-</sup> (aq.).** Varet<sup>4, 5</sup> measured the heat of solution of Ni (CN)<sub>2</sub> (c) in 2 KCN (aq.), 2 NaCN (aq.), Ba (CN)<sub>2</sub> (aq.), and Sr (CN)<sub>2</sub> (aq.), respectively.

**Ni (C<sub>2</sub>H<sub>3</sub>O<sub>2</sub>)<sub>2</sub> (aq.).** This value is obtained from those for the ions.

**NiBr<sub>2</sub> · 3 CH<sub>3</sub>OH (c).** Lloyd, Brown, Bonnell, and Jones<sup>1</sup> measured the dissociation pressures.

**2 NiI<sub>2</sub> · PbI<sub>2</sub> (c).** Mosnier<sup>1</sup> measured the heat of solution.

**2 NiI<sub>2</sub> · PbI<sub>2</sub> · 3 H<sub>2</sub>O (c).** Mosnier<sup>1</sup> measured the heat of solution.

**NiBr<sub>2</sub> · n HgBr<sub>2</sub> (aq.).** Varet<sup>6</sup> measured the heats of mixing NiBr<sub>2</sub> (aq.) with 1 and 2 moles of HgBr<sub>2</sub> (aq.).

**(Ni + n Cu) (solid solution).** White<sup>2</sup> measured the heat of fusion of monel metal, a solid solution of nickel and copper.

### COBALT

**Co (c, III).** Standard state.

**Co (c, II).** For the heat of transition at the Curie point, 460°, Umino<sup>1a, 4</sup> reported the values -0.13 and -0.06.

**Co (c, I).** For the heat of transition at 1150°, Umino<sup>1a, 4</sup> reported the values -0.07 and -0.12. See also Wust, Meuthen, and Durrer,<sup>1</sup> and Pionchon.<sup>2</sup>

**Co (liq.).** Umino<sup>4</sup> reported a value for the heat of fusion of cobalt.

**Co (g).** Millar<sup>1</sup> calculated the heat of sublimation at 25° to be -85.0. We have estimated the value for 2375°. See also Ruff and Kerlig.<sup>1</sup> The energy states of gaseous monatomic cobalt have been evaluated from the data of Catalan<sup>8</sup> and Findlay.<sup>1</sup>

**Co<sup>++</sup> (aq.).** The value for this substance is obtained from that for CoCl<sub>2</sub> (aq.).

**CoO (c).** Mixer<sup>11</sup> determined the heat of combustion of cobalt to form CoO (c) to be 57.5. See also Dulong.<sup>2</sup> Mixer's<sup>11</sup> experiments with sodium peroxide probably lead to the formation of Na<sub>2</sub>CoO<sub>3</sub>, in which case his data yield, for CoO (amorp.), *Qf*=51. The recent equilibrium data of Emmett and Schultz<sup>1</sup> on the reaction, CoO (c) + H<sub>2</sub> (g) = Co (c) + H<sub>2</sub>O (g), yield, for CoO (c), *Qf*=56.2. See also Glaser,<sup>3</sup> Chaudron,<sup>1</sup> and Wohler and Balz.<sup>2</sup>

**Co<sub>3</sub>O<sub>4</sub> (c).** Mixer's<sup>11</sup> data on the reaction of Co<sub>3</sub>O<sub>4</sub> (c) with sodium peroxide yield, for Co<sub>3</sub>O<sub>4</sub> (c), *Qf*=196.6. Biltz<sup>8</sup> computed *Qf*=196.2 from the dissociation pressure data of Foote and Smith.<sup>1</sup> The agreement is probably fortuitous.

**Co(OH)<sub>2</sub> (c).** Thomsen<sup>15</sup> measured the heats of reaction of CoSO<sub>4</sub> (400) with Ba(OH)<sub>2</sub>(400) and with 2 NaOH(200) to be 12.23 and 5.89, respectively.

**Co(OH)<sub>3</sub> (c).** Thomsen<sup>15</sup> measured the heat of the reaction, 2 CoCl<sub>2</sub> (aq.) + NaClO (aq.) + H<sub>2</sub>O (liq.) + 4 NaOH (aq.) = 2 Co(OH)<sub>3</sub> (c) + 5 NaCl (aq.).

**CoF<sub>2</sub> (aq.).** Petersen<sup>3</sup> measured the heat of mixing CoCl<sub>2</sub> (aq.) with 2 AgF (aq.) to be 31.97.

**CoF<sub>2</sub> (liq.).** The high temperature equilibrium data of Jellinek and Rudat<sup>1</sup> on the reaction,  $\text{CoF}_2 (\text{liq.}) + \text{H}_2 (\text{g}) = \text{Co} (\text{c}) + 2 \text{HF} (\text{g})$ , yield the value  $Q_f^{700} = 161$ .

**CoCl<sub>2</sub> (aq.).** Thomsen<sup>15</sup> measured the heat of solution of  $\text{Co} (\text{c})$  in  $2 \text{HCl} (\text{aq.})$  to be 16.35.

**CoCl<sub>2</sub> (c).** Thomsen<sup>15</sup> measured the heat of solution.

**CoCl<sub>2</sub> · 2 H<sub>2</sub>O (c).** Sabatier<sup>2</sup> measured the heat of solution.

**CoCl<sub>2</sub> · 6 H<sub>2</sub>O (c).** Thomsen<sup>15</sup> measured the heat of solution. See also the equilibrium data of Biltz,<sup>6</sup> Lescœur,<sup>2, 4</sup> Crut,<sup>1</sup> Jellinek and Podjaski,<sup>1</sup> and Jellinek and Uloth.<sup>1</sup>

**CoBr<sub>2</sub> (aq.).** This value is obtained from those for the ions. Fabre<sup>1</sup> measured the heat of the reaction of  $\text{Co} (\text{c})$  with bromine water to be 37.0.

**CoBr<sub>2</sub> (c).** Crut<sup>1</sup> measured the heat of solution to be 18.4; whence, for  $\text{CoBr}_2 (\text{c})$ ,  $Q_f = 54.6$ . Crut's<sup>1</sup> data on the equilibrium,  $\text{CoBr}_2 (\text{c}) + \text{H}_2 (\text{g}) = \text{Co} (\text{c}) + 2 \text{HBr} (\text{g})$ , yield, for  $\text{CoBr}_2 (\text{c})$ ,  $Q_f = 56.9$ .

**CoBr<sub>2</sub> · 6 H<sub>2</sub>O (c).** Crut<sup>1</sup> measured the heat of solution.

**CoI<sub>2</sub> (aq.).** This value is obtained from those for the ions. Pigeon<sup>1</sup> measured the heat of reaction of  $\text{Co} (\text{c})$  with  $\text{NaI}_3 (\text{aq.})$  to be 41.5.

**CoI<sub>2</sub> (c).** Mosnier<sup>1</sup> measured the heat of solution.

**CoS (c, ppt.).** Thomsen<sup>15</sup> measured the heat of the reaction of  $\text{CoSO}_4 (400)$  with  $\text{Na}_2\text{S} (400)$  to be 16.30. See also Jellinek and Zakowsky.<sup>1</sup>

**Co<sub>2</sub>S<sub>3</sub> (c).** We have estimated this value.

**CoSO<sub>4</sub> (aq.).** Thomsen<sup>15</sup> measured the heat of reaction of  $\text{CoSO}_4 (400)$  with  $\text{BaCl}_2 (400)$  to be 5.69; and of  $\text{CoCl}_2 (200)$  with  $\text{H}_2\text{SO}_4 (200)$  and  $\text{CoSO}_4 (200)$  with  $2 \text{HCl} (100)$  to be 1.15 and 2.44. These data yield, for  $\text{CoSO}_4 (400)$ ,  $Q_f = 231.7$ , and for  $\text{CoSO}_4 (200)$ ,  $Q_f = 231.6$ .

**CoSO<sub>4</sub> (c).** We have estimated the heat of dehydration of the hexahydrate and the heat of dissociation of the diammine.

**CoSO<sub>4</sub> · 6 H<sub>2</sub>O (c).** Carpenter and Jette<sup>1</sup> measured the vapor pressures in the system, heptahydrate-hexahydrate-water vapor.

**CoSO<sub>4</sub> · 7 H<sub>2</sub>O (c).** Thomsen<sup>15</sup> measured the heat of solution.

**CoSe (c).** Fabre<sup>1</sup> measured the heat of reaction of  $\text{CoSe} (\text{c})$  with bromine water to be 74.0 and of  $\text{CoSO}_4 (\text{aq.})$  with  $\text{Na}_2\text{Se} (\text{aq.})$  to be 33.1; whence, for  $\text{CoSe} (\text{c})$ ,  $Q_f = 13.3$  and 12.0, respectively.

**CoTe (c).** Fabre<sup>1</sup> measured the heat of reaction of  $\text{CoTe} (\text{c})$  with bromine water to be 115.9.

**Co(NO<sub>3</sub>)<sub>2</sub> (aq.).** The value for this substance is obtained from those for the ions.

**Co(NO<sub>3</sub>)<sub>2</sub> (c).** Guntz and Martin<sup>1</sup> measured the heat of solution.

**Co(NO<sub>3</sub>)<sub>2</sub> · 6 H<sub>2</sub>O (c).** Thomsen<sup>15</sup> measured the heat of solution.

**Co(NO<sub>3</sub>)<sub>2</sub> · 6 H<sub>2</sub>O (liq.).** Reisenfeld and Milchsack<sup>1</sup> reported the heat of fusion to be  $-8.7$  at  $56^\circ$ .

**CoX<sub>2</sub> · nNH<sub>3</sub> (c).** Biltz and Hüttig<sup>1, 2</sup> and Biltz and Fetkenheuer<sup>2</sup> obtained dissociation pressure data on the ammines of  $\text{CoCl}_2$  and  $\text{CoBr}_2$  with 1, 2, and 6  $\text{NH}_3$ , and those of  $\text{CoI}_2$  with 2 and 6  $\text{NH}_3$ , and measured

the following heats of solution in aqueous HCl:  $\text{CoCl}_2 \cdot 6 \text{NH}_3$  (c), 46.3;  $\text{CoCl}_2 \cdot 2 \text{NH}_3$  (c), 19.6;  $\text{CoCl}_2 \cdot \text{NH}_3$  (c), 17.5;  $\text{CoCl}_2$  (c), 18.0. Ephraim<sup>1, 9</sup> measured the dissociation pressures of the hexammines of  $\text{CoCl}_2$ ,  $\text{CoBr}_2$ , and  $\text{CoI}_2$ .

$\text{CoF}_2 \cdot \text{H}_2\text{O} \cdot n\text{NH}_3$  (c). Biltz and Rahlfs<sup>2</sup> obtained dissociation pressure data on the ammines with  $\frac{1}{2}$ , 1, and 5  $\text{NH}_3$ .

$\text{CoSO}_4 \cdot n\text{NH}_3$  (c). Ephraim<sup>8</sup> obtained dissociation pressure data on the ammines with  $\frac{1}{2}$ , 2, 3, 4, and 6  $\text{NH}_3$ .

$[\text{Co} \cdot (\text{NH}_3)_5 \cdot \text{NO}_3] (\text{NO}_3)_2$  (c). Lamb and Simmons<sup>1</sup> measured the heat of reaction of this substance with aqueous sodium sulfide, the cobalt product being  $\text{Co}_2\text{S}_3$  (c).

$[\text{Co} \cdot (\text{NH}_3)_5 \cdot \text{NO}_3] (\text{NO}_3)_2$  (aq.). Lamb and Simmons<sup>1</sup> measured the heat of solution of the solid.

$[\text{Co} \cdot (\text{NH}_3)_5 \cdot \text{NO}_3]^{++}$  (aq.). This value is obtained from the aqueous nitrate.

$[\text{Co} \cdot (\text{NH}_3)_5 \cdot \text{H}_2\text{O}] (\text{NO}_3)_3$  (c). Lamb and Simmons<sup>1</sup> measured the heat of reaction of this substance with aqueous sodium sulfide, the product containing cobalt being  $\text{Co}_2\text{S}_3$  (c).

$[\text{Co} \cdot (\text{NH}_3)_5 \cdot \text{H}_2\text{O}] (\text{NO}_3)_3$  (aq.). Lamb and Simmons<sup>1</sup> measured the heat of solution of the solid.

$[\text{Co} \cdot (\text{NH}_3)_5 \cdot \text{H}_2\text{O}]^{+++}$  (aq.). This value is obtained from those for the aqueous nitrate, chloride, and bromide.

$[\text{Co} \cdot (\text{NH}_3)_5 \cdot \text{H}_2\text{O}] \text{X}_3$  (c). Lamb and Simmons<sup>1</sup> measured the heats of reaction of the chloride and the bromide with aqueous sodium sulfide, the cobalt product being  $\text{Co}_2\text{S}_3$  (c).

$[\text{Co} \cdot (\text{NH}_3)_5 \cdot \text{H}_2\text{O}] \text{X}_3$  (aq.). Lamb and Simmons<sup>1</sup> measured the heats of solution of the solid bromide and chloride.

$[\text{Co} \cdot (\text{NH}_3)_5 \cdot \text{X}] \text{X}_2$  (c). Lamb and Simmons<sup>1</sup> measured the heats of reaction of the chloride and the bromide with aqueous sodium sulfide, the cobalt product being  $\text{Co}_2\text{S}_3$  (c).

$[\text{Co} \cdot (\text{NH}_3)_5 \cdot \text{X}] \text{X}_2$  (aq.). Lamb and Simmons<sup>1</sup> measured the heats of solution of the solid chloride and the bromide.

$[\text{Co} \cdot (\text{NH}_3)_5 \cdot \text{Cl}]^{++}$  (aq.). This value is obtained from the aqueous chloride.

$[\text{Co} \cdot (\text{NH}_3)_5 \cdot \text{Br}]^{++}$  (aq.). This value is obtained from the aqueous bromide.

$\text{CoBr}_2 \cdot 2 \text{NH}_4 \text{Br}$  (aq.). Varet<sup>6</sup> measured the heat of mixing  $\text{CoBr}_2$  (aq.) with  $2 \text{NH}_4\text{Br}$  (aq.) to be 0.17.

$\text{Co} (\text{NH}_4)_2 (\text{SO}_4)_2 \cdot 6 \text{H}_2\text{O}$  (c). From dissociation pressure data, Caven and Ferguson<sup>1</sup> determined the heat of dissociation of the hexahydrate to the dihydrate.

$\text{Co}_3\text{C}$  (c). The equilibrium data of Schenck, Krageloh, and Eisenstecken<sup>1</sup> yield  $Q_f = -11.3$ .

$\text{CoCO}_3$  (c). de Carli<sup>1</sup> measured the heat of the reaction of  $\text{CoSO}_4$  (600) with  $\text{Na}_2\text{CO}_3$  (600) to be  $-4.04$ .

$\text{CoX}_2 \cdot n \text{CH}_3\text{OH}$  (c). Dissociation pressure data on  $\text{CoCl}_2 \cdot 3 \text{CH}_3\text{OH}$

(c),  $\text{CoBr}_2 \cdot 3 \text{CH}_3\text{OH}$  (c), and  $\text{CoBr}_2 \cdot 2 \text{CH}_3\text{OH}$  (c) were obtained by Lloyd, Brown, Bonnell, and Jones.<sup>1</sup>

$\text{Co}(\text{C}_2\text{H}_5\text{SO}_4)_2$  (aq.). Thomsen<sup>15</sup> measured the heat of reaction of aqueous cobalt sulfate with aqueous barium ethyl sulfate to be 5.76.

$2 \text{CoI}_2 \cdot \text{PbI}_2$  (c). Mosnier<sup>1</sup> measured the heat of solution.

$2 \text{CoI}_2 \cdot \text{PbI}_2 \cdot 3 \text{H}_2\text{O}$  (c). Mosnier<sup>1</sup> measured the heat of solution.

$\text{CoBr}_2 \cdot n \text{HgBr}_2$  (aq.). Varet<sup>6</sup> measured the heat of mixing  $\text{CoBr}_2$  (aq.) with  $\frac{1}{2}$ , 1, and 2 moles of  $\text{HgBr}_2$  (aq.).

$\text{CoCl}_3 \cdot 6\text{NH}_3$  (c). Biltz<sup>3</sup> measured the dissociation pressures.

## IRON

**Fe (c).** Normal iron at room temperature is taken as the standard state, and is labeled the  $\alpha$  or IV form. The transition from IV to III, or  $\alpha$  to  $\beta$ , is associated with a change in magnetic properties and takes place in the range from 725° to 785°, mainly at the Curie point, 769°. The data on this heat of transition are: Wust, Meuthen, and Durrer<sup>1, 2</sup> -0.348; Pionchon,<sup>2</sup> -0.298; Osmond,<sup>1</sup> -0.07; Laschtschenko,<sup>2</sup> -0.30; Durrer,<sup>1</sup> -0.28 and -0.31; Stansfield,<sup>1</sup> -0.05; Meuthen,<sup>1</sup> -0.31; Klinkhardt,<sup>1</sup> -0.375; Bredemeier,<sup>1</sup> -0.737; Oberhoffer and Grosse,<sup>1</sup> -0.14. See also Dinkler<sup>1</sup> and Weiss, Piccard, and Carard.<sup>1</sup> The transition from III to II, or  $\beta$  to  $\gamma$ , occurs at 906°, and is associated with a change in crystal properties, the forms being martensite and ferrite. The data on the heat of this transition are: Klinkhardt,<sup>1</sup> -0.214; Durrer,<sup>1</sup> -0.37; Meuthen,<sup>1</sup> -0.30; Stansfield,<sup>1</sup> -0.159; Laschtschenko,<sup>1</sup> -0.34; Osmond,<sup>1</sup> -0.21; Wust, Meuthen, and Durrer,<sup>1, 2</sup> -0.35; Oberhoffer and Grosse,<sup>1</sup> -0.38. For the heat of the transition from II to I, or  $\gamma$  to  $\delta$ , which occurs at 1405°, the data are: Wust, Meuthen, and Durrer,<sup>1, 2</sup> -0.103; Bredemeier,<sup>1</sup> -0.108; Durrer,<sup>1</sup> -0.108. See also the review of Yap.<sup>1</sup>

**Fe (liq.).** The data on the heat of fusion of iron at its melting point, 1535°, are Umino,<sup>3</sup> -3.86; Oberhoffer and Grosse,<sup>1</sup> -3.60.

**Fe (g).** The vapor pressure data of Greenwood<sup>3, 5</sup> and Ruff and Bormann<sup>1</sup> were reviewed by Johnston, Fenwick, and Leopold<sup>1</sup> and yield -73.8 for the heat of vaporization at 2000°; whence at 18° the heat of sublimation becomes -89.0. For this latter Sherman<sup>1</sup> calculated -94, and Jones, Langmuir, and Mackay<sup>1</sup> reported -89. See also Millar.<sup>1</sup>

The energy states of gaseous monatomic iron have been evaluated from the data of Laporte,<sup>1</sup> Russell,<sup>1, 2</sup> White,<sup>5</sup> and Gilroy.<sup>1</sup>

**$\text{Fe}_3\text{O}_4$  (c).** The product of the combustion of iron in oxygen is principally  $\text{Fe}_3\text{O}_4$ . The data on the heat of combustion of iron are: Dulong,<sup>2</sup> 278; Andrews,<sup>14</sup> 275; Mixter,<sup>15</sup> 265.2; Ruff and Gersten,<sup>3</sup> 268.3; Ruff and Gersten,<sup>2</sup> 266.4; Baykoff and Erniloff,<sup>1</sup> 275; Roth,<sup>5</sup> 266.9. See also Doepke.<sup>1</sup> Mixter's<sup>15</sup> data on the reaction with sodium peroxide yield, for  $\text{Fe}_3\text{O}_4$  (c, III),  $Q_f=265$ . Berthelot's<sup>70</sup> data on the heat of solution of iron in aqueous HCl yield  $Q_f=289$ . The heats of transition of  $\text{Fe}_3\text{O}_4$  (c) were measured by Millar.<sup>6</sup>

**FeO (c).** The values for the heat of combustion of FeO (c) to form

$\frac{1}{3}$  Fe<sub>3</sub>O<sub>4</sub> (c) are: LeChatelier,<sup>8</sup> 25.2; Roth,<sup>5</sup> 24.7. See also Ruff and Gersten,<sup>2</sup> Roth's<sup>5</sup> value yields, for FeO (c, I),  $Q_f=64.3$ . Mixer's<sup>15</sup> data on the reaction with sodium peroxide yield  $Q_f=65.0$ . The equilibrium data of Wohler and Gunther,<sup>1</sup> Chaudron,<sup>1</sup> and Groningen<sup>1</sup> on the reaction,  $\text{Fe (c)} + \text{H}_2\text{O (g)} = \text{FeO (c)} + \text{H}_2\text{ (g)}$ , yield, for FeO (c, I)  $Q_f=62.7$ . See also Tigerschoild,<sup>1</sup> Schreiner and Grimmes,<sup>1</sup> Wohler and Balz,<sup>2</sup> von Royen,<sup>1</sup> Treadwell,<sup>1</sup> and Eastman and Evans.<sup>1</sup> The equilibrium data of Wohler and Gunther,<sup>1</sup> Chaudron,<sup>1</sup> and Groningen<sup>1</sup> on the reaction,  $3\text{FeO (c)} + \text{H}_2\text{O (g)} = \text{Fe}_3\text{O}_4\text{ (c)} + \text{H}_2\text{ (g)}$ , yield, for FeO (c, I),  $Q_f=64.3$ . From equilibrium data on the reaction,  $\text{FeO (c)} + \text{CO (g)} = \text{Fe (c)} + \text{CO}_2\text{ (g)}$ , Garrañ calculated, for FeO (c, I),  $Q_f=64.6$ . See also Tigerschoild,<sup>1</sup> Matsubara,<sup>1</sup> and Chaudron.<sup>1, 2, 3</sup> Millar<sup>6</sup> measured the heat of transition.

Fe<sub>2</sub>O<sub>3</sub> (c). For the heat of combustion of Fe<sub>2</sub>O<sub>3</sub> (c) to form  $\frac{2}{3}$  Fe<sub>3</sub>O<sub>4</sub> (c), LeChatelier,<sup>8, 10</sup> found -15 and Roth<sup>5</sup> -20.6. The latter value yields, for Fe<sub>2</sub>O<sub>3</sub> (c),  $Q_f=198.5$ . Mixer's<sup>15</sup> data on the reaction with sodium peroxide yield 194.6. Berthelot<sup>70</sup> measured the heat of solution of iron in HCl(4) to be 17.1. See also Walden,<sup>1</sup> Biltz,<sup>8</sup> Sosman and Hostetter,<sup>1</sup> and Treadwell.<sup>1</sup>

Fe(OH)<sub>2</sub> (c, ppt.). Thomsen<sup>15</sup> measured the heats of the reactions of FeSO<sub>4</sub> (aq.) with 2KOH (aq.) and with Ba(OH)<sub>2</sub> (aq.) to be 6.34 and 12.00, respectively; whence, for Fe(OH)<sub>2</sub> (c, ppt.),  $Q_f=135.9$ .

Fe(OH)<sub>3</sub> (c, ppt.). Thomsen<sup>15</sup> measured the heat of the reaction of FeCl<sub>3</sub> (aq.) with 3NaOH (aq.) to be 24.5. See also Petersen<sup>3</sup> and Mixer.<sup>15</sup>

Fe<sup>++</sup> (aq.). The value for aqueous ferrous ion is obtained from that for aqueous ferrous chloride.

FeCl<sub>2</sub> (aq.). Thomsen<sup>15</sup> and Richards, Rowe, and Burgess<sup>1</sup> measured the heat of solution of iron in 2HCl(200). Their data yield, for FeCl<sub>2</sub>(400),  $Q_f=100.18$  and 99.76, respectively. See also Favre and Silbermann<sup>3</sup> and Andrews.<sup>3</sup>

FeCl<sub>2</sub> (c). Thomsen<sup>15</sup> found  $S=17.90_{400}$ . See also Favre and Silbermann.<sup>3</sup>

FeCl<sub>2</sub> · nH<sub>2</sub>O (c). Sabatier<sup>2, 4</sup> measured the heats of solution of the di- and tetrahydrates. Dissociation pressure data on the dihydrate were reported by Lescoeur.<sup>7</sup>

FeCl<sub>2</sub> (g). Maier's<sup>1</sup> vapor pressure data yield -32.1 for the heat of vaporization.

FeCl<sub>3</sub> (aq.). Thomsen<sup>15</sup> measured the heats of reaction of FeCl<sub>2</sub> (aq.) with HClO (aq.) and with Cl<sub>2</sub> (g) to form FeCl<sub>3</sub> (aq.) to be 54.44 and 55.00, respectively. See also Berthelot,<sup>26</sup> Doerinkel,<sup>1</sup> and Browne.<sup>1</sup> Data on the heat of dilution of aqueous ferric chloride were reported by Thomsen.<sup>15</sup> (The heat of mixing aqueous ferric chloride with aqueous HCl is large.)

Fe<sup>+++</sup> (aq.). Pissarjewsky<sup>1a</sup> obtained data on the equilibrium,  $\text{Fe}^{++}\text{ (aq.)} + \text{Ag}^+\text{ (aq.)} = \text{Fe}^{+++}\text{ (aq.)} + \text{Ag (c)}$ , and reported  $Q=8.7$ , whence,

for  $\text{Fe}^{+++}(\text{aq.})$ ,  $Qf=4.1$ . Fleharty's<sup>1</sup> recent data on the equilibrium,  $\text{Fe}^{++}(\text{aq.}) + \frac{1}{2} \text{Hg}_2^{++}(\text{aq.}) = \text{Fe}^{+++}(\text{aq.}) + \text{Hg}(\text{liq.})$ , yield  $Q=10.0$ ; whence, for  $\text{Fe}^{+++}(\text{aq.})$ ,  $Qf=10.6$ . From the values for  $\text{FeCl}_3(\text{aq.})$  and  $\text{Cl}^-(\text{aq.})$ , one obtains, for  $\text{Fe}^{+++}(\text{aq.})$ ,  $Qf=9.3$ .

**$\text{FeCl}_3(\text{c.})$ .** Lemoine<sup>1</sup> measured the heat of solution.

**$\text{FeCl}_3 \cdot n\text{H}_2\text{O}(\text{c.})$ .** Sabatier<sup>2, 4</sup> measured the heat of solution of the hydrate with  $2\frac{1}{2} \text{H}_2\text{O}$ , and Lemoine<sup>1</sup> that of the hexahydrate.

**$\text{Fe}_2\text{Cl}_6(\text{g.})$ .** Deville and Troost<sup>1</sup> have shown that the vapor of ferric chloride has the formula  $\text{Fe}_2\text{Cl}_6$ . The vapor pressure data of Stirnemann<sup>1</sup> yield  $-33.1$  for the heat of sublimation of  $\text{Fe}_2\text{Cl}_6$ .

**$\text{Fe}_2\text{Cl}_6(\text{liq.})$ .** The vapor pressure data of Stirnemann<sup>1</sup> yield  $-11.3$  for the heat of vaporization of the liquid.

**$\text{FeF}_2(\text{aq.})$ .** Petersen<sup>3</sup> measured the heat of mixing  $2\text{AgF}(300)$  with  $\text{FeCl}_2(600)$  to be  $31.76$ .

**$\text{FeF}_2(\text{liq.})$ .** The equilibrium data of Jellinek and Rudat<sup>1</sup> yield, for  $\text{FeF}_2(\text{liq.})$ ,  $Qf^{800}=158$ .

**$\text{FeF}_3(\text{aq.})$ .** Petersen<sup>3</sup> measured the heat of mixing  $\text{FeCl}_3(300)$  with  $3\text{HF}(50)$  and  $\text{FeF}_3(300)$  with  $3\text{HCl}(50)$ , the heat of the reaction of  $3\text{AgF}(200)$  with  $\text{FeCl}_3(600)$ , and the heat of solution of  $\text{Fe}(\text{OH})_3(\text{c.})$  in aqueous  $\text{HF}$ . His data yield, for  $\text{FeF}_3(1200)$ ,  $Qf=243.3$ , and for  $\text{FeF}_3(300)$ ,  $Qf=242.5$ .

**$\text{FeF}_3(\text{liq.})$ .** The dissociation pressure data of Jellinek and Rudat<sup>1</sup> yield, for  $\text{FeF}_3(\text{liq.})$ ,  $Qf^{700}=233$ .

**$\text{FeOCl}(\text{c.})$ .** Stirnemann's<sup>1</sup> data on the equilibrium in the system,  $\text{FeOCl}(\text{c.}) - \text{Fe}_2\text{O}_3(\text{c.}) - \text{Fe}_2\text{Cl}_6(\text{g.})$ ; yield for the reaction,  $6\text{FeOCl}(\text{c.}) = \text{Fe}_2\text{Cl}_6(\text{g.}) + 2\text{Fe}_2\text{O}_3(\text{c.})$ ,  $Q=-26.0$ ; whence, for  $\text{FeOCl}(\text{c.})$ ,  $Qf=97.1$ .

**$\text{Fe}(\text{ClO}_3)_3(\text{aq.})$ .** Thomsen<sup>15</sup> measured the heat of reaction of aqueous barium chlorate with aqueous ferric sulfate.

**$\text{FeBr}_2(\text{aq.})$ .** This value is obtained from the ions.

**$\text{FeBr}_2(\text{c.})$ .** We have estimated the heat of solution.

**$\text{FeBr}_3(\text{aq.})$ .** The values for the ions yield  $Qf=95.2$ . Fabre<sup>1</sup> reported the low value  $88.6$ , which may be attributed to incomplete reaction.

**$\text{FeI}_2(\text{aq.})$ .** This value is obtained from the ions.

**$\text{FeI}_2(\text{c.})$ .** Mosnier<sup>1</sup> measured the heat of solution. See also Andrews.<sup>3</sup>

**$\text{FeI}_3(\text{aq.})$ .** This value is obtained from the ions.

**$\text{FeS}(\text{c.})$ .** The data on the directly measured heat of formation are: Mullenhoff,<sup>1</sup>  $25.0$ ; Mannheimer,<sup>1</sup>  $22.8$ ; Parravano and Cesaris,<sup>1</sup>  $23.07$ . Mixer's<sup>15</sup> data on the reaction with sodium peroxide yield  $Qf=19$ . Berthelot<sup>14</sup> and Thomsen<sup>15</sup> measured the heat of reaction of aqueous ferrous sulfate with aqueous sodium sulfide, the latter's data yielding, for  $\text{FeS}(\text{c.})$ ,  $Qf=23.4$ . See also Jellinek and Zakowsky.<sup>1</sup>

**$\text{FeS}(\text{liq.})$ .** For the heat of fusion, at  $195^\circ$ , Bornemann<sup>1</sup> reported  $-0.28$  and Bornemann and Hegstenberg<sup>1</sup>  $-0.5$ .

**$\text{FeS}_2(\text{c.})$ .** Mixer's<sup>15</sup> data on the heats of the reactions of pyrite and of marcasite with sodium peroxide yield identical values for the two crystal forms of  $\text{FeS}_2(\text{c.})$ , namely  $Qf=35.5$ . The data of Cavazzi<sup>2</sup> on the

heat of combustion of  $\text{FeS}_2$  (c) yield the approximate value 44. See also the equilibrium data and calculations of Rudder and Ferrer,<sup>1</sup> Halferdahl,<sup>1</sup> Allen and Lombard,<sup>1</sup> and Kamura.<sup>1</sup> We have selected the value from Mixer's<sup>15</sup> data because of the difficulty of interpreting the equilibrium data in terms of a pure reaction.

$\text{FeSO}_4$  (aq.). Thomsen<sup>15</sup> reported  $Q=3.60$  for the reaction,  $\text{FeCl}_2(200) + \text{H}_2\text{SO}_4(200) = \text{FeSO}_4(200) + 2\text{HCl}(100)$ ; whence, for  $\text{FeSO}_4(200)$ ,  $Q_f=235.94$ . Data on the heat of dilution of aqueous ferrous sulfate were reported by Thomsen.<sup>15</sup>

$\text{FeSO}_4$  (c). deForcrand<sup>64</sup> measured the heat of solution. See also the equilibrium data of Keppeler and d'Ans<sup>1</sup> and Greulich.<sup>1</sup>

$\text{FeSO}_4 \cdot \text{H}_2\text{O}$  (c). deForcrand<sup>64</sup> measured the heat of solution.

$\text{FeSO}_4 \cdot 4\text{H}_2\text{O}$  (c). deForcrand<sup>64</sup> measured the heat of solution.

$\text{FeSO}_4 \cdot 7\text{H}_2\text{O}$  (c). The data on the heat of solution are: Thomsen,<sup>15</sup>  $-4.52_{400}$ ; deForcrand,<sup>64</sup>  $-4.32_{110}$ <sup>14</sup>. Dissociation pressure data on the heptahydrate were obtained by Cohen and Visser,<sup>2</sup> Schumb,<sup>1</sup> Precht and Kraut,<sup>1</sup> and Wiedemann.<sup>1</sup>

$\text{Fe}_2(\text{SO}_4)_3$  (aq.). Thomsen<sup>15</sup> measured the heat of reaction of aqueous barium chloride with aqueous ferric sulfate to be 27.43 per mole of ferric sulfate. His data yield, for  $\text{Fe}_2(\text{SO}_4)_3(400)$ ,  $Q_f=653.0$ . See also Berthelot,<sup>50</sup> Tamanaeff,<sup>1</sup> and Pissarjewsky.<sup>2</sup> Data on the heat of dilution of aqueous ferric sulfate were reported by Thomsen,<sup>15</sup> Lemoine,<sup>1</sup> and Berthelot.<sup>5, 26</sup>

$\text{Fe}(\text{HSO}_4)_3$  (600). Berthelot<sup>5</sup> measured the heat of mixing  $3\text{H}_2\text{SO}_4(200)$  with  $\text{Fe}_2(\text{SO}_4)_3(600)$ .

$\text{FeSe}$  (c). Fabre<sup>1</sup> measured the heat of reaction of  $\text{FeSe}$  (c) with bromine water to be 117.4, and of  $\text{FeSO}_4$  (aq.) with  $\text{Na}_2\text{Se}$  (aq.) to be 30.1. His data yield, for  $\text{FeSe}$  (c),  $Q_f=14.0$  and 13.2.

$\text{FeTe}$  (c). Fabre's<sup>1</sup> data on the heat of solution of ferrous telluride in bromine water yield, for  $\text{FeTe}$  (c),  $Q_f=8$ .

$\text{Fe}_4\text{N}$  (c). The equilibrium data of Emmett, Hendricks, and Braunauer<sup>1</sup> on the reaction,  $2\text{Fe}_4\text{N}(\text{c}) + 3\text{H}_2(\text{g}) = 3\text{Fe}(\text{c}) + 2\text{NH}_3(\text{g})$ , yield  $Q=24.1$  at  $500^\circ$ , whence, for  $\text{Fe}_4\text{N}$  (c),  $Q_f=-1.1$ . See also Fowler and Hartog.<sup>1, 1a</sup>

$\text{Fe}(\text{NO}_3)_2$  (aq.). This value is obtained from the ions.

$\text{Fe}(\text{NO}_3)_3$  (aq.). Berthelot's<sup>50</sup> data on heats of mixing yield, for  $\text{Fe}(\text{NO}_3)_3(800)$ ,  $Q_f=156.3$ , and for  $\text{Fe}(\text{NO}_3)_3(200)$ ,  $Q_f=157.4$ . See also Noyes and Braun.<sup>1</sup>

$\text{Fe}(\text{NO}_3)_3 \cdot 9\text{H}_2\text{O}$  (c). Berthelot<sup>9</sup> measured the heat of solution.

$\text{FeNOSO}_4$  (aq.). Manchot<sup>2</sup> calculated the heat of solution of  $\text{NO}$  (g) in  $\text{FeSO}_4$  (aq.) to be 11.9, from vapor pressure data. By direct measurement, Gay<sup>1</sup> (see Manchot<sup>2</sup>) found 10.14.

$\text{FeNO}^{++}$  (aq.). This value is obtained from that for  $\text{FeNOSO}_4$  (aq.).

$\text{Fe}(\text{NH}_4)_2\text{NO}(\text{SO}_4)_2$  (aq.). Manchot,<sup>2</sup> from vapor pressure data, computed the heat of solution of  $\text{NO}$  (g) in  $\text{Fe}(\text{NH}_4)_2(\text{SO}_4)_2$  (aq.) to be 11.9. By direct measurement, Gay<sup>1</sup> (see Manchot<sup>2</sup>) found 10.4.

**FeNOCl<sub>2</sub> (aq.).** Gay<sup>1</sup> (see Manchot<sup>2</sup>) found the heat of solution of gaseous nitric oxide in aqueous ferrous chloride to be 10.7.

**FeNH<sub>4</sub>(SO<sub>4</sub>)<sub>2</sub> (aq.).** Berthelot<sup>5</sup> measured the heat of mixing aqueous ferric sulfate with aqueous ammonium sulfate.

**(NH<sub>4</sub>)<sub>2</sub>Fe(SO<sub>4</sub>)<sub>2</sub> · 6H<sub>2</sub>O (c).** Graham<sup>2</sup> measured the heat of solution.

**NH<sub>4</sub>Fe(SO<sub>4</sub>)<sub>2</sub> · 12H<sub>2</sub>O (c).** Berthelot<sup>151</sup> measured the heat of solution. See also Ephraim and Wagner.<sup>1</sup>

**FeCl<sub>2</sub> · nNH<sub>3</sub> (c).** Dissociation pressure data were obtained on the deca-, hexa-, di-, and monoammines by Biltz and Rahlfs,<sup>1</sup> on the hexamine by Ephraim,<sup>1, 9</sup> and on the di- and monoammines by Biltz and Hüttig.<sup>1</sup> See also Girardet<sup>1</sup> and Ephraim and Millman.<sup>1</sup> The existing data were summarized by Biltz, Klatte, and Rahlfs.<sup>1</sup>

**FeBr<sub>2</sub> · nNH<sub>3</sub> (c).** Biltz<sup>5</sup> and Biltz and Hüttig<sup>2</sup> reported dissociation pressure data on the hexa-, di-, and monoammines. See also Ephraim.<sup>9</sup>

**FeI<sub>2</sub> · nNH<sub>3</sub> (c).** The dissociation pressure data of Biltz and Hüttig<sup>1</sup> on the di- and hexammines were recalculated by Biltz and Rahlfs.<sup>1</sup> See also Ephraim.<sup>9</sup>

**FeSO<sub>4</sub> · nNH<sub>3</sub> (c).** Ephraim<sup>8</sup> measured the dissociation pressures of the mono-, di-, tri-, tetra-, and hexammines.

**FeBr<sub>3</sub> · 6NH<sub>3</sub> (c).** Ephraim and Millman<sup>1</sup> measured the dissociation pressures.

**FeF<sub>2</sub> · H<sub>2</sub>O · nNH<sub>3</sub> (c).** Biltz and Rahlfs<sup>1</sup> measured the dissociation pressures of the hemi-, mono-, and pentammines.

**Fe<sub>3</sub>C (c).** Data on the heat of combustion of iron carbide were reported by Ruff and Gersten,<sup>2</sup> Watase,<sup>2, 4</sup> Bergkoff and Ermiloff,<sup>1</sup> Brody, Jennings, and Hayes,<sup>1</sup> Roth,<sup>5</sup> and Yap and Liu.<sup>1</sup> These data were reviewed by Roth,<sup>5</sup> who concluded that for the reaction, 3Fe (c) + C (β graphite) = Fe<sub>3</sub>C (c),  $Q = -5.4$ ; whence, for Fe<sub>3</sub>C (c),  $Q_f = -5.2$  (since the standard state here is C (diamond)). See also Troost and Hautefeuille,<sup>3</sup> Campbell,<sup>1, 2, 3</sup> Maxwell and Hayes,<sup>1</sup> Schenck, Semiller, and Falcke,<sup>1</sup> and Kawakami.<sup>1</sup>

**(Fe + nC) (solid solution).** Yarroda, from indirect measurements, calculated the heat of solution of carbon in iron to be -13.5.

**Fe(CO)<sub>5</sub> (liq.).** Roth<sup>5</sup> found the heat of combustion of liquid iron carbonyl in oxygen to be 371.4, the products being CO<sub>2</sub> (g) and Fe<sub>3</sub>O<sub>4</sub> (c). This gives, for Fe(CO)<sub>5</sub> (liq.),  $Q_f = 189.8$ . Mittasch<sup>1</sup> found  $Q = 57.1$  for the reaction, Fe (c, α) + 5CO (g) = Fe(CO)<sub>5</sub> (liq.), whence, for Fe(CO)<sub>5</sub> (liq.),  $Q_f = 191.2$ .

**Fe(CO)<sub>5</sub> (g).** For the heat of vaporization of iron carbonyl, Trautz and Badsteubner<sup>1</sup> found -9.38, Dewar and Jones -7.7. See also Eyber.<sup>1</sup>

**Fe(CO)<sub>5</sub> (c).** Mittasch<sup>1</sup> found the heat of fusion to be -3.25 at about -20°.

**FeCO<sub>3</sub> (c).** Berthelot<sup>12</sup> measured the heat of reaction of FeSO<sub>4</sub> (aq.) with Na<sub>2</sub>CO<sub>3</sub> (aq.) to be -3.7, and, assuming that the precipitate was ferrous carbonate, his data yield, for FeCO<sub>3</sub> (c),  $Q_f = 180$ . LeChâtelier,<sup>8, 10</sup> reported the heat of combustion of ferrous carbonate to be zero;

Roth<sup>5</sup> reported the value 10.64. Using Roth's data one calculates, for  $\text{FeCO}_3$  (c),  $Q_f = 172.8$ .

$\text{Fe}_2(\text{C}_2\text{O}_4)_3$  (aq.). The data of Lemoine<sup>1</sup> on the heat of mixing aqueous ferric chloride with aqueous oxalic acid, and of aqueous ferric oxalate with aqueous hydrochloric acid, yield, for  $\text{Fe}_2(\text{C}_2\text{O}_4)_3(100)$ ,  $Q_f = 610.4$ . Data on the heat of dilution of aqueous ferric oxalate were reported by Lemoine.<sup>1</sup>

$\text{Fe}(\text{C}_2\text{H}_3\text{O}_2)_3$  (aq.). Thomsen<sup>15</sup> measured the heat of reaction of aqueous ferric sulfate with aqueous barium acetate to be 20.21. Berthelot<sup>5</sup> measured the heat of reaction of aqueous ferric acetate with aqueous potassium hydroxide, and the reciprocal heats of mixing involving  $\text{Fe}^{+++}$ ,  $\text{C}_2\text{H}_3\text{O}_2^-$ ,  $\text{H}^+$ , and  $\text{Cl}^-$ . Data on the heat of dilution of aqueous ferric acetate were reported by Berthelot.<sup>5</sup>

$\text{H}_4\text{Fe}(\text{CN})_6$  (aq.). Berthelot<sup>27</sup> measured the heat of the reaction of  $6\text{HCN}$  (aq.) with  $\text{Fe}(\text{OH})_2$  (c) in alkaline solution to form  $\text{H}_4\text{Fe}(\text{CN})_6$  (aq.), and his data yield, for the latter  $Q_f = -122.3$ .

$\text{H}_4\text{Fe}(\text{CN})_6$  (c). Chretien and Guinchant<sup>1</sup> measured the heat of solution.

$\text{H}_3\text{Fe}(\text{CN})_6^-$  (aq.),  $\text{H}_2\text{Fe}(\text{CN})_6^{--}$  (aq.),  $\text{HFe}(\text{CN})_6^{---}$  (aq.),  $\text{Fe}(\text{CN})_6^{---}$  (aq.). The values for these substances are obtained from the respective aqueous potassium salts.

$\text{H}_3\text{Fe}(\text{CN})_6$  (aq.). Berthelot<sup>27</sup> measured the heat of oxidation of aqueous ferrocyanic acid with bromine and with chlorine, his data yielding, for the ferricyanic acid,  $\text{H}_3\text{Fe}(\text{CN})_6$  (aq.),  $Q_f = -148.1$  and  $-148.4$ , respectively.

$\text{H}_2\text{Fe}(\text{CN})_6^-$  (aq.),  $\text{HFe}(\text{CN})_6^{--}$  (aq.),  $\text{Fe}(\text{CN})_6^{---}$  (aq.). The values for these ions are obtained from the respective aqueous potassium salts.

$\text{FeCO}(\text{CN})_5^{--}$  (aq.). This value is obtained from that for the aqueous potassium salt.

$\text{Fe}_4(\text{Fe}(\text{CN})_6)_3$  (c). Berthelot<sup>27</sup> measured the heat of reaction of aqueous ferrocyanic acid with ferric hydroxide to be 75.6, and the heat of reaction of aqueous KCN with aqueous ferrous and ferric sulfates to be 225.0; whence, for ferric ferrocyanide,  $Q_f = -322.5$  and  $-312$ .

$(\text{NH}_4)_4\text{Fe}(\text{CN})_6 \cdot 3 \text{H}_2\text{O}$  (c). Chretien and Guinchant<sup>1</sup> measured the heat of solution.

$(\text{NH}_4)_4\text{Fe}(\text{CN})_6$  (aq.). Chretien and Guinchant<sup>1</sup> measured the heat of neutralization.

$\text{Zn}_2\text{Fe}(\text{CN})_6$  (c). Joannis<sup>1</sup> measured the heat of reaction of  $\text{Na}_4\text{Fe}(\text{CN})_6$  (aq.) with  $2 \text{ZnSO}_4$  (aq.) to be 6.6 and that of  $\text{K}_3\text{Fe}(\text{CN})_6$  (aq.) with  $2 \text{ZnSO}_4$  (aq.) +  $\text{HI}$  (aq.) to be 21.2.

$\text{H}_3\text{FeCO}(\text{CN})_5 \cdot \text{H}_2\text{O}$  (c). Muller<sup>3</sup> measured the heat of combustion.

$\text{H}_3\text{FeCO}(\text{CN})_5$  (aq.). Muller<sup>3</sup> measured the heat of solution of the monohydrate.

$\text{Fe}_3\text{Si}$  (c). Campbell<sup>3</sup> measured the heat of solution of  $\text{Fe}_3\text{Si}$  (c) and of  $\text{Si}$  (c) in aqueous cupric chloride to be 87 and 107, respectively. See also Osmond<sup>2</sup> and Troost and Hautefeuille.<sup>2</sup>

**FeSiO<sub>3</sub> (c).** LeChatelier<sup>8, 10</sup> and Wologdine<sup>1</sup> reported identical values,  $Q = 5$ , for the reaction,  $\text{FeO (c)} + \text{SiO}_2 \text{ (c)} = \text{FeSiO}_3 \text{ (c)}$ . Le Chatelier<sup>8, 10</sup> also found  $Q = -7.6$  for the reaction,  $\text{FeCO}_3 \text{ (c)} + \text{SiO}_2 \text{ (c)} = \text{FeSiO}_3 \text{ (c)} + \text{CO}_2 \text{ (g)}$ . These data yield, for  $\text{FeSiO}_3 \text{ (c)}$ ,  $Q_f = 272.6$  and  $274.1$ , respectively.

**2 FeI<sub>2</sub> · PbI<sub>2</sub> (c).** Mosnier<sup>1</sup> measured the heat of solution.

**2 FeI<sub>2</sub> · PbI<sub>2</sub> · 3 H<sub>2</sub>O (c).** Mosnier<sup>1</sup> measured the heat of solution.

### MANGANESE

**Mn (c).** The standard state is Mn (c, III). Umino<sup>1</sup> measured the heats of transition.

**Mn (liq.).** The data on the heat of fusion of manganese at its melting point,  $1260^\circ$ , are: Umino,<sup>1</sup>  $-3.56$ ; Wust, Meuthen, and Durrer,<sup>1</sup>  $-2.0$ .

**Mn (g).** Vapor pressure data were reported by Greenwood<sup>2, 5</sup> and Ruff and Bormann.<sup>1</sup> These data yield  $-65$  for the heat of vaporization at  $1900^\circ$ , or  $-75$  for the heat of sublimation at  $18^\circ$ . Millar<sup>1</sup> calculated for the latter  $-58$ .

The values of the energy states of gaseous monatomic manganese are from Catalan.<sup>2</sup> See also Bacher and Goudsmit.<sup>1</sup>

**Mn<sup>++</sup> (aq.).** This value is obtained from that for  $\text{MnCl}_2 \text{ (aq.)}$ .

**Mn<sup>+++</sup> (aq.).** This value is obtained from that for  $\text{MnBr}_3 \text{ (aq.)}$ .

**MnO (c).** For the heat of formation of MnO (c) from solid manganese prepared from amalgam Guntz<sup>12</sup> reported  $98.6$ . LeChatelier<sup>10</sup> and Roth<sup>5</sup> measured the heat of combustion of MnO (c, I) in oxygen to form  $\frac{1}{3} \text{Mn}_3\text{O}_4 \text{ (c)}$ , and obtained identical values,  $Q = 18.5$ , though the recent work of Roth is undoubtedly more accurate. This value yields, for MnO (c, I),  $Q_f = 96.5$ . Millar<sup>3</sup> measured the heat of transition.

**Mn<sub>3</sub>O<sub>4</sub> (c).** The heat of combustion of 3 Mn (c, III) in oxygen to form  $\text{Mn}_3\text{O}_4 \text{ (c)}$  was measured by LeChatelier,<sup>10</sup> Ruff and Gersten,<sup>2</sup> and Roth<sup>5</sup> to be  $318$ ,  $329.7$ , and  $345.0$ , respectively.

**Mn<sub>2</sub>O<sub>3</sub> (c).** From the equilibrium data of Meyer and Rötger<sup>1</sup> on the reaction,  $6 \text{Mn}_2\text{O}_3 \text{ (c)} = 4 \text{Mn}_3\text{O}_4 \text{ (c)} + \text{O}_2 \text{ (g)}$ , Biltz<sup>8</sup> calculated  $Q = -50.4$ , whence, for  $\text{Mn}_2\text{O}_3 \text{ (c)}$ ,  $Q_f = 238.3$ . Equilibrium data on the reaction,  $4 \text{MnO}_2 \text{ (c, I)} = 2 \text{Mn}_2\text{O}_3 \text{ (c)} + \text{O}_2 \text{ (g)}$ , were reported by Wohler and Balz,<sup>2</sup> Meyer and Rötger,<sup>1</sup> and Drucker and Huttner.<sup>1</sup> The latter investigators reported  $Q = -26.0$ , whence, taking the value  $123$  for  $\text{MnO}_2 \text{ (c, I)}$ , one obtains, for  $\text{Mn}_2\text{O}_3 \text{ (c)}$ ,  $Q_f = 233$ .

**MnO<sub>2</sub> (c, ppt.).** Thomsen<sup>15</sup> measured the heat of reaction of aqueous manganous sulfate with aqueous potassium permanganate, and the heat of reaction of  $\text{MnO}_2 \text{ (c, ppt.)}$  with aqueous ferrous sulfate plus aqueous sulfuric acid. His data yield, for  $\text{MnO}_2 \text{ (c, ppt.)}$ ,  $Q_f = 115.2$  and  $115.9$ , respectively.

**MnO<sub>2</sub> (c, I).** The data of Mixer<sup>11</sup> on the reactions of Mn (c) and  $\text{MnO}_2 \text{ (c, I)}$  with sodium peroxide, yield for  $\text{MnO}_2 \text{ (c, I)}$ ,  $Q_f = 121.2$ . The equilibrium data of LeChatelier<sup>10</sup> on the reaction,  $3 \text{MnO}_2 \text{ (c, I)} = \text{Mn}_3\text{O}_4 \text{ (c)} + \text{O}_2 \text{ (g)}$ , yield  $Q = -48.0$ ; whence, for  $\text{MnO}_2 \text{ (c, I)}$ ,  $Q_f = 131$ .

**MnO<sub>2</sub> (c, II).** Millar<sup>3</sup> measured the heat of transition.

**Mn(OH)<sub>2</sub> (c, ppt.).** Thomsen<sup>15</sup> measured the heat of the reactions of MnSO<sub>4</sub>(400) with Ba(OH)<sub>2</sub>(400) and with 2 KOH(200) to be 10.31 and 4.91, respectively; whence, for Mn(OH)<sub>2</sub> (c, ppt.),  $Q_f = 163.42$  and  $163.42$ . Berthelot<sup>14</sup> measured the heat of reaction of MnCl<sub>2</sub>(400) with 2 NaOH(200) to be 3.78, whence, for Mn(OH)<sub>2</sub> (c, ppt.),  $Q_f = 162.3$ .

**Mn(OH)<sub>3</sub> (c, ppt.).** Petersen<sup>3</sup> measured the heat of mixing 2 MnF<sub>3</sub>(aq.) with 3 HF(aq.) and the heat of neutralization of (2MnF<sub>3</sub>+3 HF)(aq.) with 9 NaOH(aq.) to be  $-0.01$  and  $94.82$ , respectively; whence, for Mn(OH)<sub>3</sub> (c, ppt.),  $Q_f = 221$ .

**MnO<sub>4</sub><sup>-</sup> (aq.).** This value is obtained from that for KMnO<sub>4</sub>(aq.).

**HMnO<sub>4</sub> (aq.).** The heat of ionization of this acid is assumed to be zero.

**MnF<sub>2</sub> (aq.).** Petersen<sup>3</sup> measured the heat of reaction of MnCl<sub>2</sub>(aq.) with 2 AgF(aq.) to be  $31.7$ .

**MnF<sub>3</sub> (aq.).** This value is obtained from the ions.

**MnF<sub>3</sub> · 3 HF (aq.).** Petersen<sup>3</sup> measured the heat of mixing MnF<sub>3</sub>(aq.) with 3 HF(aq.) to be  $-0.01$ .

**MnCl<sub>2</sub> (aq.).** Thomsen<sup>15</sup> measured the heat of solution of solid manganese (0.994 Mn) in 2 HCl(50) to be  $49.6$ ; whence, for MnCl<sub>2</sub>(100),  $Q_f = 128.3$ . We have estimated the heat of dilution.

**MnCl<sub>2</sub> (c).** Thomsen<sup>15</sup> measured the heat of solution. See also the equilibrium data of Jellinek and Rudat<sup>3</sup> and Jellinek and Uloth.<sup>1</sup>

**MnCl<sub>2</sub> · nH<sub>2</sub>O (c).** For the heat of solution of the dihydrate, Foote and Saxton<sup>1</sup> found  $8.20_{300}$  and Sabatier<sup>2</sup> found  $8.1$ . Thomsen<sup>15</sup> measured the heat of solution of the tetrahydrate.

**H<sub>2</sub>MnCl<sub>6</sub> (aq.).** Berthelot<sup>68</sup> measured the heat of solution of Cl<sub>2</sub>(g) in concentrated aqueous 2 HCl · MnCl<sub>2</sub> to be  $9.2$ .

**MnBr<sub>2</sub> (aq.).** This value is obtained from the ions.

**MnBr<sub>2</sub> (c).** We have estimated the heat of solution to be  $15$ .

**MnBr<sub>2</sub> · nH<sub>2</sub>O (c).** Lescoeur<sup>7</sup> obtained dissociation pressure data on the di- and tetrahydrates.

**MnBr<sub>3</sub> (aq.).** Fabre<sup>1</sup> measured the heat of solution of manganese in bromine water to be  $109$ .

**MnI<sub>2</sub> (aq.).** This value is obtained from the ions.

**MnI<sub>2</sub> (c).** Mosnier<sup>1</sup> measured the heat of solution.

**MnI<sub>2</sub> · nH<sub>2</sub>O (c).** Lescoeur<sup>1</sup> obtained dissociation pressure data on the mono-, di-, tetra-, and hexahydrates.

**MnS (c, ppt.).** For the heat of the reaction of MnCl<sub>2</sub>(400) with Na<sub>2</sub>S(400), Berthelot<sup>14</sup> found  $Q = 6.4$  and Thomsen<sup>15</sup> found  $Q = 7.78$ . The latter figure yields, for MnS (c, ppt.),  $Q_f = 47.0$ . See also Wologdine and Penkiewitsch<sup>1</sup> and Jellinek and Podjaski.<sup>1</sup>

**MnSO<sub>4</sub> (aq.).** Thomsen<sup>15</sup> measured the heats of reaction of MnCl<sub>2</sub>(200) with H<sub>2</sub>SO<sub>4</sub>(200) and MnSO<sub>4</sub>(200) with 2 HCl(100), and of MnSO<sub>4</sub>(400) with BaCl<sub>2</sub>(400). His data yield, for MnSO<sub>4</sub>(400),  $Q_f = 264.91$  and  $265.15$ . Thomsen<sup>15</sup> measured the heat of dilution.

$\text{MnSO}_4$  (c). Thomsen<sup>15</sup> measured the heat of solution.

$\text{MnSO}_4 \cdot n\text{H}_2\text{O}$  (c). Thomsen<sup>15</sup> measured the heats of solution of the mono- and pentahydrates. Dissociation pressure data on the heptahydrate were obtained by Bolte,<sup>1</sup> Schottky,<sup>1</sup> Hollmann,<sup>1</sup> Lescœur,<sup>4</sup> Linebarger,<sup>1</sup> and Carpenter and Jette.<sup>1</sup>

$\text{Mn}_2(\text{SO}_4)_3$  (aq.). This value is obtained from the ions.

$\text{Mn}_2(\text{SO}_4)_3$  (c). Beck<sup>1</sup> measured the heat of solution.

$\text{MnS}_2\text{O}_6$  (aq.). This value is obtained from the ions.

$\text{MnS}_2\text{O}_6 \cdot 6\text{H}_2\text{O}$  (c). Thomsen<sup>15</sup> measured the heat of solution.

$\text{MnSe}$  (c). Fabre<sup>1</sup> measured the heat of solution of  $\text{MnSe}$  (c) in bromine water to be 125.6, and the heat of reaction of  $\text{MnSO}_4$  (aq.) with  $\text{Na}_2\text{Se}$  (aq.) to be 14.2; whence, for  $\text{MnSe}$  (c),  $Q_f = 34$  and 26.3, respectively.

$\text{MnN}_6$  (c). Wohler and Martin<sup>1</sup> measured the heat of decomposition of the azide to be 94.0.

$\text{Mn}_5\text{N}_2$  (c). Neumann, Kroger, and Kunz<sup>1</sup> measured the heat of solution of the nitride in aqueous (18 per cent) sulfuric acid to be 278.35, and Neumann, Kroger, and Hoebler<sup>1</sup> measured the direct heat of combination to be 57.2. The former data yield  $Q_f = 56.0$ . See also Valensi.<sup>1</sup>

$\text{Mn}(\text{NO}_3)_2$  (aq.). Thomsen<sup>15</sup> measured the heat of reaction of  $\text{Mn}(\text{OH})_2$  (c) with  $\text{HNO}_3$  (aq.) to be 22.90, whence, for  $\text{Mn}(\text{NO}_3)_2(400)$ ,  $Q_f = 147.8$ .

$\text{Mn}(\text{NO}_3)_2$  (c). Guntz and Martin<sup>1</sup> measured the heat of solution.

$\text{Mn}(\text{NO}_3)_2 \cdot 6\text{H}_2\text{O}$  (c). Thomsen<sup>15</sup> measured the heat of solution.

$\text{Mn}(\text{NO}_3)_2 \cdot 6\text{H}_2\text{O}$  (liq.). Reisenfeld and Milchsack<sup>1</sup> measured the heat of fusion of the hexahydrate.

$\text{Mn}(\text{NO}_3)_2 \cdot 3\text{H}_2\text{O}$  (liq.). We have estimated the heat of dilution from 3 to 6  $\text{H}_2\text{O}$ .

$\text{Mn}(\text{NO}_3)_2 \cdot 3\text{H}_2\text{O}$  (c). Morgan and Owens<sup>1</sup> measured the heat of fusion.

$\text{MnF}_2 \cdot \text{H}_2\text{O} \cdot n\text{NH}_3$  (c). Biltz and Rahlfs<sup>2</sup> measured the dissociation pressures of the ammines with 1 and 5  $\text{NH}_3$ .

$\text{MnX}_2 \cdot n\text{NH}_3$  (c). Biltz and Hüttig<sup>1</sup> obtained dissociation pressure data on the mono-, di-, and hexammines of  $\text{MnCl}_2$  and  $\text{MnBr}_2$ , and on the di- and hexammines of  $\text{MnI}_2$ . Ephraim<sup>1, 9</sup> obtained similar data on the hexammines of  $\text{MnCl}_2$ ,  $\text{MnBr}_2$ , and  $\text{MnI}_2$ .

$\text{MnSO}_4 \cdot n\text{NH}_3$  (c). Ephraim<sup>8</sup> reported meager data on the ammines with  $\frac{1}{2}$ , 1, 2, 5, and 6  $\text{NH}_3$ .

$\text{MnBr}_2 \cdot 2\text{NH}_4\text{Br}$  (aq.). Varet<sup>8</sup> measured the heat of mixing  $\text{MnBr}_2$  (200) with 2  $\text{NH}_4\text{Br}$  (100) to be 0.08.

$\text{MnCl}_2 \cdot 2\text{NH}_4\text{Cl} \cdot 2\text{H}_2\text{O}$  (c). Foote and Saxton<sup>1</sup> measured the heat of solution.

$\text{MnSO}_4 \cdot (\text{NH}_4)_2\text{SO}_4 \cdot n\text{H}_2\text{O}$  (c). Graham<sup>2</sup> measured the heat of solution of the hexahydrate. Ephraim and Wagner<sup>1</sup> reported the heat of dissociation of the hexahydrate to the dihydrate to be  $-11.2$  per mole of water vapor.

**Mn<sub>2</sub>(PO<sub>4</sub>)<sub>3</sub> (c, ppt.).** Joly<sup>3</sup> and Berthelot<sup>101</sup> obtained data on the heats of reaction of MnCl<sub>2</sub>(aq.) with various aqueous sodium phosphates. Because their published papers lack the details with which to make a proper interpretation of their data, we have given only the value for crystalline precipitated manganic phosphate.

**Mn<sub>3</sub>C (c).** The data on the heat of combustion of Mn<sub>3</sub>C (c) in oxygen to form Mn<sub>3</sub>O<sub>4</sub> (c) and CO<sub>2</sub> (g) are: Ruff and Gersten,<sup>2</sup> 409.8; LeChatelier,<sup>10</sup> 411.2; Roth,<sup>5</sup> 419.8. These data yield, for Mn<sub>3</sub>C (c),  $Q_f = 29.7$ , 28.3, and 19.7. See also Troost and Hautefeuille.<sup>3</sup>

**MnCO<sub>3</sub> (c, ppt.).** Thomsen<sup>15</sup> found  $Q = -2.04$  for the reaction of MnSO<sub>4</sub>(400) with Na<sub>2</sub>CO<sub>3</sub>(400); Berthelot<sup>12</sup> found  $Q^{16} = -2.36$  for the reaction of MnCl<sub>2</sub>(200) with Na<sub>2</sub>CO<sub>3</sub>(200). These data yield, for MnCO<sub>3</sub> (c, ppt.),  $Q_f = 207.85$  and 207.67, respectively.

**MnCO<sub>3</sub> (c).** For the heat of combustion of MnCO<sub>3</sub> (c) in oxygen to form  $\frac{1}{3}$  Mn<sub>3</sub>O<sub>4</sub> (c) + CO<sub>2</sub> (g), the following values were reported: Wologdine,<sup>1</sup> -3.5; LeChatelier,<sup>10</sup> -5.1; Roth,<sup>5</sup> -9.8.

**MnC<sub>2</sub>O<sub>4</sub> (c).** Smith and Topley<sup>1</sup> measured the heat of solution in HNO<sub>3</sub>(9).

**MnC<sub>2</sub>O<sub>4</sub> · nH<sub>2</sub>O (c).** Smith and Topley<sup>1</sup> measured the heat of solution in HNO<sub>3</sub>(9) of the di- and trihydrates. Berthelot<sup>9</sup> measured the heat of reaction of MnCl<sub>2</sub>(100) with K<sub>2</sub>C<sub>2</sub>O<sub>4</sub>(100) to form the solid dihydrate to be 4.3.

**Mn(CHO<sub>2</sub>)<sub>2</sub> (aq.).** Berthelot<sup>9</sup> measured the heat of neutralization of aqueous formic acid with Mn(OH)<sub>2</sub> (c) to be 21.4.

**Mn(CHO<sub>2</sub>)<sub>2</sub> (c).** Berthelot<sup>9</sup> measured the heat of solution.

**Mn(CHO<sub>2</sub>)<sub>2</sub> · 2 H<sub>2</sub>O (c).** Berthelot<sup>9</sup> measured the heat of solution.

**Mn(C<sub>2</sub>H<sub>3</sub>O<sub>2</sub>)<sub>2</sub> (aq.).** Berthelot<sup>9, 131</sup> measured the heat of neutralization of Mn(OH)<sub>2</sub> (c) with aqueous acetic acid to be 22.1.

**Mn(C<sub>2</sub>H<sub>3</sub>O<sub>2</sub>)<sub>2</sub> (c).** Berthelot<sup>9, 131</sup> measured the heat of solution.

**Mn(C<sub>2</sub>H<sub>3</sub>O<sub>2</sub>)<sub>2</sub> · 4 H<sub>2</sub>O (c).** Berthelot<sup>9, 131</sup> measured the heat of solution.

**MnSiO<sub>3</sub> (gls.).** Mulert<sup>1</sup> measured the heat of solution of this substance in aqueous (20%) HF.

**MnSiO<sub>3</sub> (c).** Mulert<sup>1</sup> measured the heat of solution of this substance in aqueous (20%) HF. For the reaction, MnO (c) + SiO<sub>2</sub> (c, quartz) = MnSiO<sub>3</sub> (c), LeChatelier<sup>10</sup> reported  $Q = 2.7$ . For the reaction, MnCO<sub>3</sub> (c) + SiO<sub>2</sub> (c, quartz) = MnSiO<sub>3</sub> (c) + CO<sub>2</sub> (g), Wologdine<sup>1</sup> and Wologdine and Penkiewitsch<sup>1</sup> reported  $Q = 19.6$ . These data yield, for MnSiO<sub>3</sub> (c),  $Q_f = 301.3$ , 302.5, and 307.3, respectively.

**2MnI<sub>2</sub> · PbI<sub>2</sub> (c).** Mosnier<sup>1</sup> measured the heat of solution.

**2MnI<sub>2</sub> · PbI<sub>2</sub> · 3 H<sub>2</sub>O (c).** Mosnier<sup>1</sup> measured the heat of solution.

**MnBr<sub>2</sub> · nHgBr<sub>2</sub> (aq.).** Varet<sup>6</sup> measured the heats of mixing MnBr<sub>2</sub> (aq.) with  $\frac{1}{2}$ , 1, and 2 moles of HgBr<sub>2</sub> (aq.).

## CHROMIUM

**Cr (c).** Standard state. Laschtschenko<sup>1</sup> reported a transition at 480° with  $T = -0.13$ , but no other investigator has found such a transition.

**Cr (liq.).** The data on the heat of fusion at 1600° are: Umino,<sup>3</sup>  $-3.65$ ; Wust, Meuthen, and Durrer,<sup>1</sup>  $-1.66$ .

**Cr (g).** Greenwood<sup>2, 5</sup> reported the boiling point of chromium to be 2200°. We have estimated the heat of vaporization to be  $-76$  at 2200°. The energy states of gaseous monatomic chromium have been evaluated from the data of Kiess,<sup>1</sup> Catalan and Sancho,<sup>1</sup> Russell,<sup>6</sup> and White.<sup>3, 4, 5</sup>

**Cr<sub>7</sub>H<sub>2</sub> (c).** Sieverts and Gotta<sup>2</sup> reported the heat of dissociation of this hydride to be  $-3.7$ .

**CrO<sub>3</sub> (c).** Mixer<sup>6, 16</sup> measured the heat of reaction of CrO<sub>3</sub> (c) with Na<sub>2</sub>O (c) to be 77.0, and of Cr (c) with Na<sub>2</sub>O<sub>2</sub> (c) to be 158.8; whence, for CrO<sub>3</sub> (c),  $Q_f = 141.1$ . Combination of the heat of neutralization of CrO<sub>3</sub> (aq.) with 2 NaOH (aq.), and of the heats of solution of CrO<sub>3</sub> (c) and Na<sub>2</sub>CrO<sub>4</sub> (c) with Mixer's<sup>6, 16</sup> data on the reaction,  $\text{Cr (c)} + 3 \text{Na}_2\text{O}_2 \text{ (c)} = \text{Na}_2\text{CrO}_4 \text{ (c)} + 2 \text{Na}_2\text{O (c)}$ ,  $Q = 158.8$ , yields, for CrO<sub>3</sub> (c),  $Q_f = 137.5$ . Roth and Becker<sup>1</sup> measured the heats of the reactions,  $\text{Cr (c)} + \frac{3}{2} \text{O}_2 \text{ (g)} = \frac{1}{2} \text{Cr}_2\text{O}_3 \text{ (c)}$  and  $\text{CrO}_3 \text{ (c)} = \frac{1}{2} \text{Cr}_2\text{O}_3 \text{ (c)} + \frac{3}{2} \text{O}_2 \text{ (g)}$ , to be 144.4 and  $-3.5$ , respectively; whence, for CrO<sub>3</sub> (c),  $Q_f = 147.9$ .

**Cr<sub>2</sub>O<sub>3</sub> (c).** Mixer<sup>6, 16</sup> measured the heats of the reactions,  $\text{Cr}_2\text{O}_3 \text{ (c)} + 3 \text{Na}_2\text{O}_2 \text{ (c)} = 2 \text{Na}_2\text{CrO}_4 \text{ (c)} + \text{Na}_2\text{O (c)}$  and  $2 \text{CrO}_3 \text{ (c)} + 2 \text{Na}_2\text{O (c)} = 2 \text{Na}_2\text{CrO}_4 \text{ (c)}$ , to be 107.8 and 154.0, respectively; whence for the reaction,  $\text{Cr}_2\text{O}_3 \text{ (c)} + 1\frac{1}{2} \text{O}_2 \text{ (g)} = 2 \text{CrO}_3 \text{ (c)}$ ,  $Q = -13.0$ , and, for Cr<sub>2</sub>O<sub>3</sub> (c),  $Q_f = 265.6$ . Roth and Becker<sup>1</sup> measured the heat of combustion of chromium in oxygen to form Cr<sub>2</sub>O<sub>3</sub> (c) to be 288.9.

**CrO<sub>3</sub> (aq.).** The data on the heat of solution of CrO<sub>3</sub> (c) are: Briechnier and Prins,<sup>1</sup> 2.47<sub>80</sub>; Morges,<sup>1</sup> 2.2; Sabatier,<sup>5</sup> 1.9. Data on the heat of dilution of aqueous CrO<sub>3</sub> were reported by Briechnier and Prins<sup>1</sup> and Morges.<sup>1</sup>

**CrO<sub>4</sub><sup>-</sup> (aq.).** The value for this ion is obtained from Na<sub>2</sub>CrO<sub>4</sub> (aq.) and K<sub>2</sub>CrO<sub>4</sub> (aq.).

**CrO (g).** Ghosh<sup>1</sup> computed the energy of dissociation of CrO (g) from spectroscopic data.

**Cr<sub>2</sub>O<sub>7</sub><sup>-</sup> (aq.).** This value is obtained from those for Na<sub>2</sub>Cr<sub>2</sub>O<sub>7</sub> (aq.) and K<sub>2</sub>Cr<sub>2</sub>O<sub>7</sub> (aq.).

**[CrX<sub>3-n</sub>]<sup>n</sup> (aq.).** Trivalent chromium salts form several distinct kinds of solutions: the purple solution, which is supposed to contain  $[\text{Cr} \cdot 6 \text{H}_2\text{O}] \text{X}_3$ ; the green solution, which is supposed to contain  $[\text{Cr} \cdot 4 \text{H}_2\text{O} \cdot \text{X}_2] \text{X}$ ; and others of less importance for the present purpose. In writing the formulas of the aqueous ions and molecules, we have omitted the water molecules, so that for the above molecules are written  $[\text{Cr}] \text{X}_3$  and  $[\text{Cr} \cdot \text{X}_2] \text{X}$  and the positive ions  $[\text{Cr}]^{+++}$  and  $[\text{Cr} \cdot \text{X}_2]^+$ . The number of molecules of H<sub>2</sub>O necessary to make the coordination number of chromium have the value 6 have been omitted in writing the formulas

of the aqueous ions and the aqueous molecules and in computing the respective heats of formation. When dichromates are reduced in acid solution, the product is the green solution containing  $[\text{Cr} \cdot \text{X}_2]\text{X}$ . Thomsen<sup>15</sup> found  $Q=219.6$  for the reaction,  $2\text{CrO}_3(\text{aq.}) + 6\text{HCl}(\text{aq.}) + 3(\text{SnCl}_2 + 2\text{HCl})(\text{aq.}) = 3(\text{SnCl}_4 + 2[\text{Cr} \cdot \text{Cl}_2]\text{Cl})(\text{aq.}) + 6\text{H}_2\text{O}(\text{liq.})$ ; whence, for  $[\text{Cr} \cdot \text{Cl}_2]\text{Cl}(\text{aq.})$ ,  $Q_f=166.5$ . Berthelot<sup>16</sup> found  $Q=153.8$  for the preferable reaction,  $\text{K}_2\text{Cr}_2\text{O}_7(\text{aq.}) + 8\text{HCl}(\text{aq.}) + 6\text{HI}(\text{aq.}) = (2[\text{Cr} \cdot \text{Cl}_2]\text{Cl} + 6\text{HCl} + 3\text{KCl})(\text{aq.}) + 7\text{H}_2\text{O}(\text{liq.}) + 3\text{I}_2(\text{c.})$ ; whence, for  $[\text{Cr} \cdot \text{Cl}_2]\text{Cl}(\text{aq.})$ ,  $Q_f=173.6$ . Neuman, Kroger, and Kunz<sup>1</sup> measured the heat of solution of chromium in  $\text{HCl}(8)$  to be 50.6; whence, assuming the product to be  $[\text{Cr} \cdot \text{Cl}_2]\text{Cl}(\text{aq.})$ , one finds, for the latter,  $Q_f=167.3$ . Recoura<sup>3</sup> measured the heat of reaction of  $[\text{Cr}](\text{OH})_3(\text{c, ppt.})$  with  $3\text{HCl}(\text{aq.})$  to form  $[\text{Cr}]\text{Cl}_3(\text{aq., purple})$  to be 20.7. Bjerrum<sup>1</sup> computed the heat of the same reaction to be 21.2, from data on the hydrolysis constant. Recoura<sup>3</sup> measured the heat of reaction of  $3\text{NaOH}(\text{aq.})$  with  $[\text{Cr}]\text{Br}_3(\text{aq.})$  and with  $[\text{Cr} \cdot \text{Br}_2]\text{Br}(\text{aq.})$ .

$[\text{Cr} \cdot 6\text{H}_2\text{O}]\text{Br}_3(\text{c, purple})$ . Recoura<sup>3</sup> measured the heat of solution.

$[\text{Cr} \cdot 4\text{H}_2\text{O} \cdot \text{Br}_2] \cdot 2\text{H}_2\text{O}(\text{c, green})$ . Recoura<sup>3</sup> measured the heat of solution.

$[\text{CrCl}_2]\text{Cl}(\text{c, rose})$ . Recoura<sup>3</sup> measured the heat of solution.

$[\text{Cr} \cdot 4\text{H}_2\text{O} \cdot \text{Cl}_2]\text{Cl}(\text{c, green})$ . Higley<sup>1</sup> measured the heat of solution.

$[\text{Cr} \cdot 4\text{H}_2\text{O} \cdot \text{Cl}_2]\text{Cl} \cdot 2\text{H}_2\text{O}(\text{c, green})$ . Recoura<sup>3</sup> measured the heat of solution.

$[\text{Cr} \cdot 4\text{H}_2\text{O} \cdot \text{Cl}_2]\text{Cl} \cdot 6\text{H}_2\text{O}(\text{c, green})$ . Higley<sup>1</sup> measured the heat of solution.

$[\text{Cr} \cdot 6\text{H}_2\text{O}]\text{Cl}_3(\text{c, purple})$ . Recoura<sup>3</sup> measured the heat of solution.

$[\text{Cr}]^{+++}(\text{aq., purple})$ . This value is obtained from that for the aqueous chloride.

$[\text{Cr}]^{++}(\text{aq.})$ . This value is obtained from that for  $\text{CrCl}_2(\text{aq.})$ .

$\text{Cr}_3\text{O}_{10}^{--}(\text{aq.})$ . We have estimated the heat of the reaction,  $\text{Cr}_2\text{O}_7^{--}(\text{aq.}) + \text{CrO}_3(\text{aq.}) = \text{Cr}_3\text{O}_{10}^{--}(\text{aq.})$ .

$\text{H}_2\text{CrO}_4(\text{aq.})$ . We have taken this as equivalent to  $\text{CrO}_3(\text{aq.}) + \text{H}_2\text{O}(\text{liq.})$ .

$[\text{Cr} \cdot \text{Cl}_2]^+(\text{aq.})$ . This value is obtained from that for the aqueous chloride.

$[\text{Cr}](\text{OH})_3(\text{c, ppt.})$ . Recoura<sup>3</sup> measured the heat of reaction of  $[\text{Cr} \cdot \text{Cl}_2]\text{Cl}(\text{aq.})$  with  $3\text{NaOH}(\text{aq.})$

$[\text{Cr} \cdot (\text{OH})_2]\text{OH}(\text{c, ppt.})$ . Recoura<sup>3</sup> measured the heat of reaction of this substance with  $3\text{HCl}(\text{aq.})$ .

$[\text{Cr} \cdot \text{OH}](\text{OH})_2(\text{c, ppt.})$ . Recoura<sup>3</sup> measured the heat of reaction of this substance with  $3\text{HCl}(\text{aq.})$ .

$[\text{Cr} \cdot (\text{OH})_2]\text{Cl}(\text{aq.})$ . From data on the hydrolysis constant, Bjerrum<sup>1</sup> computed the heat of the reaction of this substance with  $\text{HCl}(\text{aq.})$  to be 8.1.

$[\text{Cr} \cdot \text{OH}]\text{Cl}_2$  (aq.). From data on the hydrolysis constant, Bjerrum<sup>1</sup> computed the heat of reaction of this substance with  $\text{HCl}$  (aq.) to be 9.6.

$[\text{Cr}(\text{OH})]^{++}$  (aq.). This value is obtained from that for the aqueous chloride.

$\text{CrCl}_2$  (aq.). Recoura<sup>3</sup> measured the heat of the reaction,  $2\text{CrCl}_2(\text{aq.}) + \frac{1}{2}\text{O}_2(\text{g}) + \text{H}_2\text{O}(\text{liq.}) = 2[\text{Cr} \cdot \text{OH}]\text{Cl}_2(\text{aq.})$ , to be 30.4.

$\text{CrCl}_2$  (c). Recoura<sup>3</sup> measured the heat of solution. See also Jellinek and Koop.<sup>1</sup>

$\text{CrCl}_2 \cdot 4\text{H}_2\text{O}$  (c, dark green). Recoura<sup>3</sup> measured the heat of solution.

$\text{CrCl}_2 \cdot 3\text{H}_2\text{O}$  (c, light green). Knight and Rich<sup>1</sup> studied the equilibrium between the tetra- and trihydrates.

$\text{CrI}_2$  (c). Recoura<sup>3</sup> measured the heat of solution.

$\text{CrI}_2$  (aq.). This value is obtained from the ions.

$[\text{Cr}]\text{F}_3$  (aq.). Petersen<sup>3</sup> measured the heat of reaction of  $[\text{Cr}]\text{F}_3$  (aq.) with  $3\text{NaOH}$  (aq.) to be 23.65.

$\text{H}_3[\text{Cr}]\text{F}_6$  (aq.). Petersen<sup>3</sup> measured the heat of reaction of  $[\text{Cr}]\text{F}_3$  (aq.) with  $3\text{HF}$  (aq.).

$\text{CrF}_3$  (c). Jellinek and Rudat<sup>1</sup> studied the equilibrium,  $2\text{CrF}_2(\text{c}) + \text{F}_2(\text{g}) = 2\text{CrF}_3(\text{c})$ , finding  $Q = 158.0$ .

$\text{CrF}_2$  (c). Jellinek and Rudat,<sup>1</sup> from equilibrium data on the direct formation,  $\text{Cr}(\text{c}) + \text{F}_2(\text{g}) = \text{CrF}_2(\text{c})$ , computed  $Q_f = 152$ .

$\text{CrO}_2\text{Cl}_2$  (liq.). Berthelot<sup>53, 54, 93</sup> measured the heat of solution. See also Moles and Gomez.<sup>1</sup>

$\text{CrO}_2\text{Cl}_2$  (g). From data on the boiling point elevation, Beckmann<sup>4</sup> computed the heat of vaporization.

$[\text{Cr}]_2(\text{SO}_4)_3$  (aq., purple). Thomsen<sup>15</sup> measured the heat of neutralization of  $[\text{Cr}](\text{OH})_3$  (c, ppt.) with  $\text{H}_2\text{SO}_4$  (aq.) to be 49.3; whence, for  $[\text{Cr}]_2(\text{SO}_4)_3$  (aq., purple),  $Q_f = 772.2$ . Colson<sup>2</sup> measured the heat of reaction of  $3\text{BaCl}_2$  (aq.) with  $[\text{Cr}]_2(\text{SO}_4)_3$  (aq.) to be 19.95; whence, for  $[\text{Cr}]_2(\text{SO}_4)_3$  (aq., purple),  $Q_f = 772.3$ .

$[\text{Cr}_2 \cdot (\text{SO}_4)_3]$  (aq., green). Colson<sup>2</sup> measured the heat of reaction of this solution with  $6\text{NaOH}$  (aq.) to be 61.1; whence  $Q_f = 757.4$ . See also Recoura.<sup>2</sup>

$[\text{Cr}_2 \cdot (\text{SO}_4)_2]\text{SO}_4$  (aq., green). Colson<sup>2</sup> measured the heat of reaction of this substance with  $6\text{NaOH}$  (aq.) to be 57.6; whence  $Q_f = 760.9$ . See also Recoura.<sup>2</sup>

$[\text{Cr}_2 \cdot \text{SO}_4](\text{SO}_4)_2$  (aq., green). Colson<sup>2</sup> measured the heat of reaction of this substance with  $6\text{NaOH}$  (aq.) to be 50.7; whence,  $Q_f = 767.8$ . See also Recoura.<sup>2</sup>

$\text{Cr}_2(\text{SO}_4)_3$  (aq., "modified"). When heated, the purple aqueous chromic sulfate is hydrolyzed, and we have assumed that this "modified" solution is  $([\text{Cr}_2 \cdot (\text{SO}_4)_2](\text{OH})_2 + \text{H}_2\text{SO}_4)$  (aq.). Colson<sup>2</sup> measured the heats of reaction of both hydrolyzed and normal solutions with  $6\text{NaOH}$  (aq.) to obtain the difference in their heats of formation.

$\text{Cr}_2(\text{SO}_4)_3 \cdot 6\text{H}_2\text{O}$  (c, green). Colson<sup>2</sup> measured the heat of solution.

$[\text{Cr} \cdot 6\text{H}_2\text{O}]_2(\text{SO}_4)_3 \cdot n\text{H}_2\text{O}$  (c, purple). Senechal<sup>1</sup> and Recoura<sup>2</sup> measured the heats of solution of various hydrates. We have utilized Senechal's<sup>1</sup> data to distinguish the three hydrates with  $n=2, 3$ , and  $5$ .

$\text{CrN}$  (c). Neuman, Kroger, and Hawbler<sup>1</sup> reported  $Q_f=29.5$ . See also Valenski.<sup>1</sup>

$(\text{NH}_4)_2\text{CrO}_4$  (aq.). Morges<sup>1</sup> measured the heat of reaction of  $\text{CrO}_3$  (500) with  $\text{NH}_4\text{OH}$  (100) to be 23.48. See also Berthelot.<sup>95</sup>

$(\text{NH}_4)_2\text{CrO}_4$  (c). Sabatier<sup>5</sup> measured the heat of solution.

$(\text{NH}_4)_2\text{Cr}_2\text{O}_7$  (aq.). Berthelot<sup>95</sup> measured the heat of reaction of  $(\text{NH}_4)_2\text{Cr}_2\text{O}_7$  (aq.) with  $\text{NH}_4\text{OH}$  (aq.) and with  $2\text{KOH}$  (aq.). See also Morges<sup>1</sup> and Moles and Gonzales.<sup>1</sup>

$(\text{NH}_4)_2\text{Cr}_2\text{O}_7$  (c). For the heat of solution, Moles and Gonzales<sup>1</sup> found  $-12.90_{540}^{16}$  and Berthelot<sup>95</sup>  $-12.4^{13}$ .

$\text{CrCl}_2 \cdot n\text{NH}_3$  (c). Ephraim and Millman<sup>1</sup> obtained dissociation pressure data on the di- and triammines.

$\text{Cr}_3\text{C}_2$  (c). Heusler<sup>1</sup> studied the equilibrium,  $3\text{Cr}_2\text{O}_3$  (c) +  $13\text{C}$  (c) =  $2\text{Cr}_3\text{C}_2$  (c) +  $9\text{CO}$  (g), and calculated  $Q = -297$ .

$\text{PbCrO}_4$  (c). Goldblum and Stoffella<sup>1</sup> measured the heat of reaction of aqueous potassium chromate with aqueous lead nitrate to be 10.6. For the heat of the reaction of aqueous lead chloride with aqueous potassium chromate, Roth, Schwartz, and Buchner<sup>1</sup> found  $Q = 11.16$ .

$2\text{CrI}_2 \cdot \text{PbI}_2$  (c). Mosnier<sup>1</sup> measured the heat of solution.

$2\text{CrI}_2 \cdot \text{PbI}_2 \cdot 3\text{H}_2\text{O}$  (c). Mosnier<sup>1</sup> measured the heat of solution.

## MOLYBDENUM

$\text{Mo}$  (c). Standard state.

$\text{Mo}$  (g). Jones, Langmuir, and Mackay<sup>1</sup> reported values for the vapor pressure of solid molybdenum. The energy states of gaseous monatomic molybdenum are evaluated from the data of Catalan<sup>1</sup> and Meggers and Kiess.<sup>1</sup> See also Bacher and Goudsmit.<sup>1</sup>

$\text{MoO}_3$  (c). For the heat of formation of this substance, Moose and Parr<sup>1</sup> found 176.5, which value was obtained by combustion of molybdenum in oxygen in a bomb. For the same quantity, Delepine<sup>2</sup> found 167. Mixer's<sup>10</sup> data on the reaction of  $\text{Mo}$  (c) with  $3\text{Na}_2\text{O}_2$  (c) and of  $\text{MoO}_3$  (c) with  $\text{Na}_2\text{O}$  (c) yield  $Q = 205.3$  and  $81.9$ , respectively; whence, for  $\text{MoO}_3$  (c),  $Q_f = 182.7$ .

$\text{MoO}_2$  (c). Mixer<sup>10</sup> measured the heat of reaction of  $\text{MoO}_2$  (c) with  $\text{Na}_2\text{O}_2$  (c) to be 101.2.

$\text{H}_2\text{MoO}_4$  (aq.). Pechard<sup>1</sup> measured the heat of reaction of  $\text{Na}_2\text{MoO}_4$  (aq.) with  $\text{H}_2\text{SO}_4$  (400) to be 6.9.

$\text{MoO}_3$  (aq.). This is taken as equivalent to  $\text{H}_2\text{MoO}_4$  (aq.) -  $\text{H}_2\text{O}$  (liq.).

$\text{MoO}_4$  (aq.). Pissarjewsky<sup>2, 4</sup> measured the heat of reaction of  $\text{MoO}_3$  (aq.) with  $\text{H}_2\text{O}$  (aq.) to be 8.1.

$\text{MoO}_5$  (aq.). Pissarjewsky<sup>2, 4</sup> measured the heat of reaction of  $\text{MoO}_3$  (aq.) with  $2\text{H}_2\text{O}_2$  (aq.) to be 12.35.

$\text{MoO}_3 \cdot n\text{H}_2\text{O}$  (c) or  $\text{H}_2\text{WO}_4 \cdot (n-1)\text{H}_2\text{O}$  (c). Hüttig and Kurre<sup>1</sup> obtained dissociation pressure data on the mono- and dihydrates of  $\text{MoO}_3$ .

$\text{MoO}_4^{--}$  (aq.). This value is obtained from that for  $\text{Na}_2\text{MoO}_4$  (aq.).

$\text{MoF}_6$  (c),  $\text{MoF}_6$  (liq.). Ruff and Ascher<sup>1</sup> measured the vapor pressures of the solid and liquid.

$\text{PbMoO}_4$  (c). Tammann and Westerhold<sup>1</sup> calculated the heat of dissociation of  $\text{PbO} \cdot \text{MoO}_3$  (c).

$\text{CuMoO}_4$  (c). Tammann and Westerhold<sup>1</sup> calculated the heat of dissociation of  $\text{CuO} \cdot \text{MoO}_3$  (c).

$\text{FeMoO}_4$  (c). Tammann and Westerhold<sup>1</sup> calculated the heat of dissociation of  $\text{FeO} \cdot \text{MoO}_3$  (c).

$\text{Fe}_2(\text{MoO}_4)_3 \cdot x\text{H}_2\text{O}$  (c). Tammann and Westerhold<sup>1</sup> calculated the heat of dissociation of the hydrated  $\text{Fe}_2\text{O}_3 \cdot 3\text{MoO}_3 \cdot x\text{H}_2\text{O}$  (c) where  $x$  is unknown.

### TUNGSTEN

**W** (c). Standard state.

**W** (g). Values for the vapor pressure of solid tungsten were computed by Jones, Langmuir, and Mackay<sup>1</sup> from data on the rate of loss of weight of heated tungsten wires. See also van Liempt.<sup>2</sup> The values for the energy states of gaseous monatomic tungsten are from Bacher and Goudsmit.<sup>1</sup>

$\text{WO}_3$  (c). For the heat of combustion of tungsten in oxygen to form  $\text{WO}_3$  (c), Moose and Parr<sup>1</sup> found 195.7. See also Delepine and Hallopeau,<sup>1</sup> Delepine,<sup>6</sup> Wiess, Martin, and Stimmelmayer,<sup>1</sup> and van Liempt.<sup>4</sup> Mixer's<sup>6</sup> data on the heat of the reaction of  $\text{W}$  (c) with  $3\text{Na}_2\text{O}_2$  (c) and of  $\text{WO}_3$  (c) with  $\text{Na}_2\text{O}$  (c) yield  $Q = 231.2$  and  $94.70$ , respectively; whence, for  $\text{WO}_3$  (c),  $Q_f = 195.8$ .

$\text{WO}_2$  (c). Delepine and Hallopeau<sup>1</sup> measured the heat of combustion of  $\text{WO}_2$  (c) to form  $\text{WO}_3$  (c) to be  $65.2$ ; whence, for  $\text{WO}_2$  (c),  $Q_f = 130.5$ . From equilibrium studies, Shibata<sup>2</sup> calculated  $Q = 11.5^{1000}$  for the reaction,  $\frac{1}{2}\text{WO}_2$  (c) +  $\text{CO}$  (g) =  $\frac{1}{2}\text{W}$  (c) +  $\text{CO}_2$  (g), whence, for  $\text{WO}_2$  (c),  $Q_f = 115$ . Similar data on the reaction,  $\text{W}$  (c) +  $2\text{H}_2\text{O}$  (g) =  $\text{WO}_2$  (c) +  $\text{H}_2$  (g), which was studied by Chaudron,<sup>1,2</sup> yield  $Q = 8.8$ , whence, for  $\text{WO}_2$  (c),  $Q_f = 124$ .

$\text{W}_2\text{O}_5$  (c). Shibata<sup>2</sup> studied the equilibria,  $\text{W}_2\text{O}_5$  (c) +  $\text{CO}$  (g) =  $2\text{WO}_2$  (c) +  $\text{CO}_2$  (g) and  $2\text{WO}_3$  (c) +  $\text{CO}$  (g) =  $\text{W}_2\text{O}_5$  (c) +  $\text{CO}_2$  (g), and calculated  $Q = 4.7$  and  $7.2$ , respectively; whence, for  $\text{W}_2\text{O}_5$  (c),  $Q_f = 324$  and  $331$ . Chaudron's<sup>1</sup> data on the equilibrium,  $2\text{WO}_2$  (c) +  $\text{H}_2\text{O}$  (g) =  $\text{W}_2\text{O}_5$  (c) +  $\text{H}_2$  (g), yield  $Q = 4.0^{850}$ ; whence, for  $\text{W}_2\text{O}_5$  (c),  $Q_f = 323$ . See also Alterthum and Koref<sup>1</sup> and van Liempt.<sup>3</sup>

$\text{H}_2\text{WO}_4$  (c), or  $\text{WO}_3 \cdot \text{H}_2\text{O}$  (c). Hüttig and Kurre<sup>1</sup> obtained data on the dissociation pressure.

$\text{H}_2\text{WO}_4$  (aq.). Pissarjewsky<sup>2</sup> measured the heat of solution of the solid in aqueous  $\text{NaOH}$  to be  $13.7$ .

$\text{WO}_3 \cdot n\text{H}_2\text{O}_2$  (aq.). Pissarjewsky<sup>2</sup> measured the heat of mixing

$\text{H}_2\text{WO}_4$  (aq.) with 1, 2, and 3 moles of  $\text{H}_2\text{O}_2$  (aq.) to be 0.9, 1.5 and 3.2, respectively.

$\text{WF}_6$  (c),  $\text{WF}_6$  (liq.). Ruff and Ascher<sup>1</sup> measured the vapor pressures of the liquid and solid.

$\text{WS}_2$  (c). Parravano and Malquori<sup>2</sup> studied the equilibrium  $\text{W}$  (c) +  $2\text{H}_2\text{S}$  (g) =  $\text{WS}_2$  (c) +  $2\text{H}_2$  (g), and computed  $Q = 73.4^{950}$ .

$\text{W}(\text{CN})_8^{---}$  (aq.),  $\text{W}(\text{CN})_8^{---}$  (aq.). Collenberg<sup>1</sup> reported  $Q = 16.85$  for the reaction,  $\text{Hg}$  (liq.) +  $\text{Cl}^-$  (aq.) +  $\text{W}(\text{CN})_8^{---}$  (aq.) =  $\text{HgCl}$  (c) +  $\text{W}(\text{CN})_8^{---}$  (aq.).

$\text{CuWO}_4$  (c). Tammann and Westerhold<sup>1</sup> reported the heat of the reaction of  $\text{CuO}$  (c) with  $\text{WO}_3$  (c) to be 12.1.

$\text{CuWO}_4 \cdot 2\text{H}_2\text{O}$  (c). Tammann and Westerhold<sup>1</sup> reported  $Q = 19.0$  for the reaction of  $\text{CuO}$  (c) with  $\text{WO}_3$  (c) and  $2\text{H}_2\text{O}$  (liq.).

$\text{FeWO}_4$  (c). Tammann and Westerhold<sup>1</sup> reported  $Q = 9.7$  for the reaction of  $\text{FeO}$  (c) with  $\text{WO}_3$  (c).

$\text{FeWO}_4 \cdot 3\text{H}_2\text{O}$  (c). Tammann and Westerhold<sup>1</sup> reported  $Q = 17.2$  for the reaction of  $\text{FeO}$  (c) with  $\text{WO}_3$  (c) and  $3\text{H}_2\text{O}$  (liq.).

$\text{Fe}_2(\text{WO}_4)_3 \cdot 8\text{H}_2\text{O}$  (c). Tammann and Westerhold<sup>1</sup> reported  $Q = 7.2$  for the reaction of  $\text{Fe}_2\text{O}_3$  (c) with  $3\text{WO}_3$  (c) and  $8\text{H}_2\text{O}$  (liq.).

## URANIUM

$\text{U}$  (c). Standard state.

$\text{U}$  (g). We have estimated the heat of sublimation.

$\text{UO}_3$  (c). Mixer<sup>14</sup> measured the heats of the reactions,  $\text{U}$  (c) +  $3\text{Na}_2\text{O}_2$  (c) =  $\text{Na}_2\text{UO}_4$  (c) +  $2\text{Na}_2\text{O}$  (c) and  $\text{UO}_3$  (c) +  $\text{Na}_2\text{O}$  (c) =  $\text{Na}_2\text{UO}_4$  (c), to be 341.8 and 96.1, respectively; whence, for  $\text{UO}_3$  (c),  $Q_f = 305.0$ . Mixer<sup>14</sup> measured the heats of the reactions,  $3\text{U}$  (c) +  $4\text{O}_2$  (g) =  $\text{U}_3\text{O}_8$  (c),  $\text{U}_3\text{O}_8$  (c) +  $\text{Na}_2\text{O}_2$  (c) +  $2\text{Na}_2\text{O}$  (c) =  $3\text{Na}_2\text{UO}_4$ , and  $\text{UO}_3$  (c) +  $\text{Na}_2\text{O}$  (c) =  $\text{Na}_2\text{UO}_4$  (c), to be 845.2, 285.1, and 96.1, respectively; whence, for  $\text{UO}_3$  (c),  $Q_f = 287.3$ . Biltz and Fendius<sup>1</sup> measured the heat of solution of  $\text{UO}_3$  (c) in  $(\text{FeCl}_3 + \text{HCl})$  (aq.) to be 20.8, and combining this with other unnamed data deduced, for  $\text{UO}_3$  (c),  $Q_f = 291.6$ .

$\text{UO}_2$  (c). Mixer<sup>14</sup> measured the heat of the reaction,  $\text{UO}_2$  (c) +  $\text{Na}_2\text{O}_2$  (c) =  $\text{Na}_2\text{UO}_4$  (c), to be 110.9.

$\text{U}_3\text{O}_8$  (c). Mixer<sup>14</sup> measured the heat of combustion of  $\text{U}$  (c) in oxygen to form  $\text{U}_3\text{O}_8$  (c) to be 845.2, and measured the heat of the reaction,  $\text{U}_3\text{O}_8$  (c) +  $\text{Na}_2\text{O}_2$  (c) +  $2\text{Na}_2\text{O}$  (c) =  $3\text{Na}_2\text{UO}_4$  (c), to be 285.1. The latter reaction yields, for  $\text{U}_3\text{O}_8$  (c),  $Q_f = 857.8$ .

$\text{UO}_3 \cdot n\text{H}_2\text{O}$  (c). Hüttig and Kurre,<sup>1</sup> from dissociation pressure data, computed the heats of dissociation of the hydrates with 2,  $1\frac{1}{2}$ , 1, and  $\frac{1}{2}$   $\text{H}_2\text{O}$  to be 15.0, 16.7, 20.2, and 26.6, respectively, per mole of  $\text{H}_2\text{O}$  (g). de Forcrand<sup>58</sup> measured the heats of solution of the anhydrous oxide and the mono- and dihydrates in 2  $\text{HNO}_3$  (110) to be 19.8, 14.85, and 12.38, respectively. Aloy<sup>1</sup> measured the heat of solution of the dihydrate to be 8.8 in 2  $\text{HBr}$  (100), 8.4 in 2  $\text{HNO}_3$  (100), 8.4 in 2  $\text{HCl}$  (100), 9.5 in  $\text{H}_2\text{SO}_4$  (200), and 7.5 in 2  $\text{HC}_2\text{H}_3\text{O}_2$  (100).

$\text{UO}_2\text{Cl}_2$  (aq.). Aloy<sup>1</sup> measured the heat of solution of  $\text{UO}_3 \cdot 2 \text{H}_2\text{O}$  (c) in  $2 \text{HCl}$  (100) to be 8.4.

$\text{UO}_2(\text{NO}_3)_2$  (aq.). de Forcrand<sup>58</sup> measured the heat of solution of  $\text{UO}_3$  (c) in  $2 \text{HNO}_3$  (110) to be 19.8.

$\text{UO}_2\text{SO}_4$  (aq.). Aloy<sup>1</sup> measured the heat of solution of  $\text{UO}_3 \cdot 2 \text{H}_2\text{O}$  (c) in  $\text{H}_2\text{SO}_4$  (200) to be 9.5.

$\text{UO}_2\text{Br}_2$  (aq.). Aloy<sup>1</sup> measured the heat of solution of  $\text{UO}_3 \cdot 2 \text{H}_2\text{O}$  (c) in  $2 \text{HBr}$  (100) to be 8.8.

$\text{UO}_2(\text{C}_2\text{H}_3\text{O}_2)_2$  (aq.). Aloy<sup>1</sup> measured the heat of solution of  $\text{UO}_3 \cdot 2 \text{H}_2\text{O}$  (c) in  $2 \text{HC}_2\text{H}_3\text{O}_2$  (100) to be 7.5.

$\text{UO}_2^{++}$  (aq.). This value is obtained from those for the aqueous chloride and nitrate.

$\text{UO}_2\text{Cl}_2 \cdot \text{H}_2\text{O}$  (c). Aloy<sup>1</sup> measured the heat of solution.

$\text{UO}_4 \cdot 2 \text{H}_2\text{O}$  (c). Pissarjewsky<sup>1</sup> measured the heats of solution of  $\text{UO}_3 \cdot \text{H}_2\text{O}$  (c) and of  $\text{UO}_4 \cdot 2 \text{H}_2\text{O}$  (c) in  $\text{H}_2\text{SO}_4$  (55) to be 15.35 and  $-0.11$ , respectively.

$\text{UF}_6$  (g). Ruff and Heinzelmann<sup>1</sup> measured the vapor pressure of the liquid.

$\text{UCl}_3$  (c),  $\text{UCl}_4$  (c). Biltz and Fendius<sup>1</sup> reported the heats of solution of U (c),  $\text{UCl}_4$  (c), and  $\text{UCl}_3$  (c) in  $\text{HCl}$  (8) to be 144.4, 39.4, and 40.6, respectively; the heats of solution of  $\text{UO}_3$  (c),  $\text{UCl}_4$  (c), and  $\text{UCl}_3$  (c) in  $(\text{FeCl}_3 + \text{HCl})$  (aq.) to be 20.8, 30.3, and 30.3, respectively; the heat of solution of  $\text{Cl}_2$  (g) in  $(\text{FeCl}_2 + \text{UCl}_3)$  (aq.) to be 42.8; the heat of solution of  $\text{Cl}_2$  (g) in  $(\text{ICl}_3 + \text{UCl}_4)$  (aq.) to be 13.5; and the heats of solution of  $\text{UO}_3$  (c) and  $\text{UCl}_4$  (c) in  $(\text{ICl}_3 + \text{HCl})$  (aq.) to be 20.7 and 60.2, respectively.

$\text{U}(\text{SO}_4)_2$  (c). Beck<sup>1</sup> measured the heat of reaction with  $\text{NaOH}$  (aq.) to be 56.5.

$\text{UO}_2\text{SO}_4$  (c). Beck<sup>1</sup> measured the heat of reaction of this substance with  $\text{KOH}$  (aq.) to be 42.3.

$\text{UO}_2\text{SO}_4 \cdot 3 \text{H}_2\text{O}$  (c). Aloy<sup>1</sup> measured the heat of solution to be 5.1<sub>1000</sub>. See also Favre and Silbermann.<sup>3</sup>

$\text{U}_3\text{N}_4$  (c). Neumann, Kroger, and Haebler<sup>1</sup> reported  $Q_f = 274$ .

$\text{UO}_2(\text{NO}_3)_2$  (c). The data on the heat of solution are: de Forcrand,<sup>58</sup> 19.0<sub>220</sub><sup>12</sup>; Marketos,<sup>1</sup> 16.0.

$\text{UO}_2(\text{NO}_3)_2 \cdot \text{H}_2\text{O}$  (c). de Forcrand<sup>58</sup> measured the heat of solution.

$\text{UO}_2(\text{NO}_3)_2 \cdot 2 \text{H}_2\text{O}$  (c). de Forcrand<sup>58</sup> measured the heat of solution.

$\text{UO}_2(\text{NO}_3)_2 \cdot 3 \text{H}_2\text{O}$  (c). The data on the heat of solution are: Aloy,<sup>1</sup>  $-3.7$ <sub>1000</sub>; de Coninck,<sup>1</sup>  $-3.8$ ; de Forcrand,<sup>58</sup> 1.85<sub>220</sub><sup>12</sup>.

$\text{UO}_2(\text{NO}_3)_2 \cdot 6 \text{H}_2\text{O}$  (c). The data on the heat of solution are: de Forcrand,<sup>58</sup>  $-5.45$ <sub>220</sub><sup>12</sup>; Marketos,<sup>1</sup>  $-4.0$ .

$\text{UC}_2$  (c). From equilibrium data on the reaction,  $\text{UO}_2$  (c) +  $4 \text{C}$  (c) =  $\text{UC}_2$  (c) +  $2 \text{CO}$  (g), Heusler<sup>1</sup> calculated  $Q = 174.6$ .

$\text{UO}_2(\text{C}_2\text{H}_3\text{O}_2)_2 \cdot 2 \text{H}_2\text{O}$  (c). Aloy<sup>1</sup> measured the heat of solution.

$\text{UO}_2\text{NH}_4(\text{C}_2\text{H}_3\text{O}_2)_3 \cdot 6 \text{H}_2\text{O}$  (c). Aloy<sup>1</sup> measured the heat of solution.

$\text{UO}_2\text{CrO}_4$  (aq.). This value is obtained from the ions.

$\text{UO}_2\text{CrO}_4 \cdot 5\frac{1}{2} \text{H}_2\text{O}$  (c). Aloy<sup>1</sup> measured the heat of solution.

### VANADIUM

**V** (c). Standard state.

**V** (g). We have estimated the heat of sublimation. The values for the energy states of gaseous monatomic vanadium are from Bacher and Goudsmit<sup>1</sup> and White.<sup>3, 4</sup>

$\text{V}_2\text{O}_2$  (c),  $\text{V}_2\text{O}_3$  (c),  $\text{V}_2\text{O}_4$  (c),  $\text{V}_2\text{O}_5$  (c). Mixer<sup>14</sup> measured the heat of combustion of vanadium\* in oxygen, the product being a mixture of oxides:  $\text{V}$  (c) + 2.13  $\text{O}_2$  (g) = 0.74  $\text{V}_2\text{O}_4$  (c) + 0.26  $\text{V}_2\text{O}_5$  (c),  $Q = 381$ ;  $\text{V}_2\text{O}_2$  (c) + 1.2  $\text{O}_2$  (g) = 0.60  $\text{V}_2\text{O}_4$  (c) + 0.40  $\text{V}_2\text{O}_5$  (c),  $Q = 208.0$ ;  $\text{V}_2\text{O}_3$  (c) + 0.7  $\text{O}_2$  (g) = 0.60  $\text{V}_2\text{O}_4$  (c) + 0.40  $\text{V}_2\text{O}_5$  (c),  $Q = 55.2$ . Mixer<sup>14</sup> also measured the heat of reaction of vanadium and the various oxides of vanadium with the sodium oxides, and his data yield the following values:  $\text{V}_2\text{O}_5$  (c) +  $\text{Na}_2\text{O}$  (c) =  $\text{Na}_2\text{O} \cdot \text{V}_2\text{O}_5$  (c),  $Q = 165$ ;  $\text{V}_2\text{O}_4$  (c) +  $\text{Na}_2\text{O}_2$  (c) =  $\text{Na}_2\text{O} \cdot \text{V}_2\text{O}_5$  (c),  $Q = 174.6$ ;  $\text{V}_2\text{O}_3$  (c) + 2  $\text{Na}_2\text{O}_2$  (c) =  $\text{Na}_2\text{O} \cdot \text{V}_2\text{O}_5$  (c) +  $\text{Na}_2\text{O}$  (c),  $Q = 214.8$ ;  $\text{V}_2\text{O}_2$  (c) + 3  $\text{Na}_2\text{O}_2$  (c) =  $\text{Na}_2\text{O} \cdot \text{V}_2\text{O}_5$  (c) + 2  $\text{Na}_2\text{O}$  (c),  $Q = 340.3$ ; 2  $\text{V}$  (c) + 5  $\text{Na}_2\text{O}_2$  (c) =  $\text{Na}_2\text{O} \cdot \text{V}_2\text{O}_5$  (c) + 4  $\text{Na}_2\text{O}$  (c),  $Q = 441$ .

Ruff and Friedrich<sup>1</sup> measured the heat of combustion of pure vanadium in oxygen, to form a mixture whose composition was not determined, to be 304. Ruff and Friedrich<sup>1</sup> also measured the heats of reaction with the sodium oxides; and their data yield the following values:  $\text{V}_2\text{O}_3$  (c) +  $\text{O}_2$  (g) =  $\text{V}_2\text{O}_5$  (c),  $Q = 135$ ;  $\text{V}_2\text{O}_5$  (c) +  $\text{Na}_2\text{O}$  (c) =  $\text{Na}_2\text{O} \cdot \text{V}_2\text{O}_5$  (c),  $Q = 20.0$  (this value is to be compared with the value obtained by Mixer<sup>14</sup> which is undoubtedly too large). Muller<sup>5</sup> studied the equilibrium,  $\text{V}_2\text{O}_5$  (c) +  $\text{H}_2$  (g) =  $\text{V}_2\text{O}_4$  (c) +  $\text{H}_2\text{O}$  (g), and calculated  $Q = 117$ . Ruff and Martin<sup>1</sup> and Muthmann, Wiess, and Riedebeauch<sup>1</sup> measured the heat of combustion of vanadium (not very pure) in oxygen to form a mixture of oxides, whose composition was not determined, to be 250.5 and 313.0, respectively, per mole of vanadium.

The best correlation of all the foregoing data on the heats of the reactions involving the oxides of vanadium is obtained by selecting for  $\text{V}_2\text{O}_5$  (c),  $Q_f = 437$ ; whence we have obtained as best values for the other oxides,  $\text{V}_2\text{O}_4$  (c),  $\text{V}_2\text{O}_3$  (c), and  $\text{V}_2\text{O}_2$  (c), 383, 330, and 195, respectively.

$\text{VO}_3^-$  (aq.),  $\text{VO}_4^-$  (aq.),  $\text{VO}_5^-$  (aq). These values are obtained from those for  $\text{NaVO}_3$  (aq.),  $\text{KVO}_3$  (aq.),  $\text{KVO}_4$  (aq.), and  $\text{NaVO}_5$  (aq.).

$\text{NH}_4\text{VO}_3$  (c). Matignon<sup>12</sup> measured the heat of reaction of  $\text{NH}_4\text{VO}_3$  (c) with  $\text{NaOH}$  (aq.) to be 12.30 at 15°.

$\text{VCl}_4$  (liq.). Ruff and Friedrich<sup>1</sup> measured the heat of solution of this substance in  $\text{NaHO}_2$ (8) to be 161.8.

$\text{VCl}_3$  (liq.). Ruff and Friedrich<sup>1</sup> measured the heat of solution of the liquid trichloride in  $\text{NaHO}_2$ (8) to be 19.6.

\*The older investigators did not have pure vanadium to work with; Mixer's<sup>14</sup> sample was 90% V, and those of Ruff and Martin<sup>1</sup> ranged from 84 to 97%.

$\text{VOCl}_3$  (c). Ruff and Friedrich<sup>1</sup> measured the heat of solution of this solid oxychloride in  $\text{NaHO}_2$  (8) to be 98.1.

$\text{VCl}_2$  (c). Ruff and Friedrich<sup>1</sup> measured the heat of combustion of this substance.

$\text{V}_2\text{F}_3$  (aq). Petersen<sup>3</sup> measured the heat of reaction of  $\text{V}_2\text{F}_3$  (aq.) with 1, 2, and 3  $\text{NaOH}$  (aq.) to be 8.31, 16.09, and 15.13, respectively.

$(\text{NH}_4)_3\text{VF}_8$  (aq). Petersen<sup>3</sup> found  $Q=22.42$  for the reaction of this substance with 3  $\text{NaOH}$  (aq.).

$\text{V}_2\text{O}_4 \cdot \text{H}_2\text{O}$  (c). Gain<sup>1</sup> reported 12.62 and 10.89 for the heats of solution in 2  $\text{H}_2\text{SO}_4$  (55) of  $\text{V}_2\text{O}_4 \cdot \text{H}_2\text{O}$  (c, rose) and  $\text{V}_2\text{O}_4 \cdot \text{H}_2\text{O}$  (c, green), respectively. The heat of reaction of the resulting solutions with aqueous potassium hydroxide was found by Gain<sup>1</sup> to be 16.92 and 18.56, respectively.

#### COLUMBIUM

$\text{Cb}$  (c). Standard state.

$\text{Cb}_2\text{O}_5$  (c). Muthmann, Weiss, and Riedeabauch<sup>1</sup> measured the heat of combustion of columbium.

#### TANTALUM

$\text{Ta}$  (c). Standard state.

$\text{Ta}_2\text{O}_5$  (c). The data of Moose and Parr<sup>1</sup> yield 499.6 for the heat of combustion of tantalum to form  $\text{Ta}_2\text{O}_5$  (c); Muthmann, Weiss, and Riedeabauch<sup>1</sup> reported 308.

#### PROTOACTINIUM

$\text{Pa}$  (c). Standard state.

#### TITANIUM

$\text{Ti}$  (c). Standard state.

$\text{Ti}$  (g). We have estimated the heat of sublimation. The values for the energy states of gaseous monatomic titanium are from Russell,<sup>4</sup> Russell and Lang,<sup>1</sup> Harrison and Engwicht,<sup>1</sup> and Harrison.<sup>1</sup>

$\text{TiO}_2$  (c, rutile III). Mixer's<sup>8</sup> data on the reactions of  $\text{Ti}$  (c) with 3  $\text{Na}_2\text{O}_2$  (c) and of  $\text{TiO}_2$  (c, rutile) with  $\text{Na}_2\text{O}_2$  (c) yield  $Q=226$  and 50.3, respectively; whence, for  $\text{TiO}_2$  (c, rutile III),  $Q_f=216.1$ . Mixer's<sup>13</sup> data on the heat of combustion of titanium in oxygen yield  $Q_f=217.5$ ; those of Roth and Becker<sup>2, 3</sup> yield  $Q_f=218.7$ ; and those of Sieverts and Gotta<sup>1</sup> yield  $Q_f=220.7$ . See also Weiss and Kaiser.<sup>1</sup>

$\text{TiO}_2$  (c, rutile II),  $\text{TiO}_2$  (c, rutile I). Laschtschenko<sup>1</sup> reported values for the heats of transition of rutile.

$\text{TiO}_2$  (c, anatase). Laschtschenko<sup>1</sup> reported values for the heats of transition of anatase.

$\text{TiO}_2$  (amorphous). Mixer's<sup>8, 13</sup> data yield a value for the difference in heat content of rutile and the amorphous form of  $\text{TiO}_2$ .

$\text{TiO}_2$  (hydrated ppt.). We have estimated this value.

$\text{TiCl}_4$  (aq). Thomsen<sup>15</sup> measured the heat of reaction of this substance with 4  $\text{NaOH}$  (aq.) to be 47.66.

**TiCl<sub>4</sub> (liq.).** Thomsen<sup>15</sup> measured the heat of solution of the liquid to be 57.86<sub>2000</sub>; Bock and Moser<sup>1</sup> found 59.0.

**TiCl<sub>4</sub> (c).** Latimer<sup>1</sup> reported a value for the heat of fusion.

**TiCl<sub>4</sub> (g).** The vapor pressure data of Arie<sup>3</sup> yield, for the heat of vaporization of the liquid, -8.62 at 136° and -8.97 at 18°.

**TiCl<sub>3</sub> (c).** Bock and Moser<sup>1</sup> reported the heats of solution of the brown and violet forms of this substance.

**H<sub>2</sub>TiF<sub>6</sub> (aq.).** Thomsen<sup>15</sup> measured the heat of reaction of TiO<sub>2</sub> (hydrated ppt.) with 6 HF (aq.) to be 30.9.

**TiC (c).** Brantley and Beckman<sup>1</sup> studied the equilibrium, TiO<sub>2</sub> (c) + 3 C (c) = TiC (c) + 2 CO (g), and computed  $Q = -45.9$  at 1573°.

**TiX<sub>4</sub> · nPH<sub>3</sub> (c).** Holtje<sup>1</sup> reported the heats of the reactions, TiCl<sub>4</sub> (liq.) + PH<sub>3</sub> (g) = TiCl<sub>4</sub> · PH<sub>3</sub> (c) and TiCl<sub>4</sub> · PH<sub>3</sub> (c) + PH<sub>3</sub> (g) = TiCl<sub>4</sub> · 2 PH<sub>3</sub> (c), to be 18.6 and 10.8, respectively; and the heats of the analogous reactions with TiBr<sub>4</sub> to be 16.0 and 11.8, respectively.

**TiX<sub>4</sub> · nH<sub>2</sub>S (c).** Biltz and Kennecke<sup>1</sup> obtained dissociation pressure data on the chloride and the bromide with 1 and 2 H<sub>2</sub>S.

## ZIRCONIUM

**Zr (c).** Standard state.

**Zr (g).** We have estimated the heat of sublimation. The values of the energy states of gaseous monatomic zirconium are from Kiess and Kiess.<sup>1, 2</sup>

**ZrO<sub>2</sub> (c, monoclinic).** For the heat of combustion of zirconium, Roth and Becker<sup>1</sup> reported the value 263.4, but from later and presumably more accurate experiments Roth and Becker<sup>3</sup> obtained the value 258.1. (The product formed in this last investigation was established to be the monoclinic form by X-ray studies.) For the same reaction, Sieverts, Gotta, and Halberstadt<sup>1</sup> reported  $Q = 256.1$ . See also Weiss and Neumann.<sup>1</sup>

**ZrO<sub>2</sub> (c, ppt.).** We have estimated the heat of hydration of ZrO<sub>2</sub> (c, monoclinic) to be -5.

**ZrCl<sub>4</sub> (c).** Beck<sup>1</sup> measured the heat of solution of this substance in aqueous ammonia to be 54.3, that is, for ZrCl<sub>4</sub> (c) + 4 NH<sub>4</sub>OH (aq.) = ZrO<sub>2</sub> (c, ppt.) + 4 NH<sub>4</sub>Cl (aq.) + 2 H<sub>2</sub>O (liq.),  $Q = 54.3$ ; whence, for ZrCl<sub>4</sub> (c),  $Q_f = 268.9$ . Roth and Schwartz<sup>1</sup> and Roth and Becker<sup>3</sup> estimated a much lower value.

**ZrOSO<sub>4</sub> · SO<sub>3</sub> (c).** Beck<sup>1</sup> measured the heat of solution of this substance in aqueous sodium hydroxide to be 36.7; Chauvenet<sup>6</sup> found 32.78 for the heat of solution in water. These data yield, for ZrOSO<sub>4</sub> · SO<sub>3</sub> (c),  $Q_f = 566.3$  and 506.5.

**ZrOCl<sub>2</sub> (aq.).** Aqueous zirconium tetrachloride may be considered to be (ZrOCl<sub>2</sub> + 2 HCl) (aq.). The data of Chauvenet<sup>5</sup> suggested a value for the heat of neutralization of this solution: (ZrOCl<sub>2</sub> + 2 HCl) (aq.) + 2 NaOH (aq.) = (ZrOCl<sub>2</sub> + 2 NaCl) (aq.) + 2 H<sub>2</sub>O (liq.),  $Q = 27.0$ , and ZrOCl<sub>2</sub> (aq.) + 2 NaOH (aq.) = ZrO<sub>2</sub> (c, ppt.) + 2 NaCl (aq.) + H<sub>2</sub>O (liq.),  $Q = 19.0$ . These data yield, for ZrOCl<sub>2</sub> (aq.),  $Q_f = 272.5$ .

**ZrO<sup>++</sup> (aq.)**. This value is obtained from that for ZrOCl<sub>2</sub> (aq.).

**ZrOBr<sub>2</sub> (aq.)**. This value is obtained from those for the ions, ZrO<sup>++</sup> (aq.) and Br<sup>-</sup> (aq.).

**ZrOSO<sub>4</sub> (aq.)**. This value is obtained from the aqueous ions.

**ZrO (NO<sub>3</sub>)<sub>2</sub> (aq.)**. This value is obtained from the aqueous ions.

**ZrOCl<sub>2</sub> · nH<sub>2</sub>O (c)**. Chauvenet<sup>3</sup> measured the heats of solution of the hydrates with 2, 3½, 6, and 8 H<sub>2</sub>O.

**ZrOBr<sub>2</sub> · nH<sub>2</sub>O (c)**. Chauvenet<sup>6</sup> measured the heats of solution of the hydrates with 3½ and 8 H<sub>2</sub>O.

**ZrO(NO<sub>3</sub>)<sub>2</sub> · nH<sub>2</sub>O (c)**. Chauvenet and Nicolle<sup>1</sup> measured the heats of solution of the hydrates with 2, 3, 3½, and 6 H<sub>2</sub>O.

**ZrOSO<sub>4</sub> · 4 H<sub>2</sub>O (c)**. Chauvenet<sup>7</sup> measured the heat of solution.

**ZrOSO<sub>4</sub> · H<sub>2</sub>SO<sub>4</sub> (c)**. Chauvenet<sup>7</sup> measured the heat of solution.

**ZrC (c)**. Prescott<sup>1</sup> studied the equilibrium, ZrO<sub>2</sub> (c) + 3 C (c) = ZrC (c) + 2 CO (g), and calculated  $Q^{25} = -160$ .

#### HAFNIUM

**Hf (c)**. Standard state.

**HfO<sub>2</sub> (c, monoclinic)**. Roth and Becker<sup>3</sup> measured the heat of combustion of hafnium, to form monoclinic hafnium dioxide, to be 271.5.

#### THORIUM

**Th (c)**. Standard state.

**Th (g)**. We have estimated the heat of sublimation. See also Andrews.<sup>18</sup>

**ThO<sub>2</sub> (c)**. For the heat of combustion of thorium to form crystalline thorium dioxide, the data of von Wartenberg,<sup>6</sup> Chauvenet,<sup>6</sup> and Roth and Becker<sup>3</sup> yield 327.2, 330.2, and 292.6, respectively.

**ThH<sub>4</sub> (c)**. Dissociation pressure data on thorium hydride were reported by Chauvenet<sup>4</sup> and Matignon and Delepine.<sup>1</sup>

**ThCl<sub>4</sub> (aq.)**. Chauvenet<sup>2</sup> measured the heat of solution of thorium in aqueous (13%) HCl to be 238.5, whence, for ThCl<sub>4</sub> (aq.),  $Q_f = 392$ .

**ThCl<sub>4</sub> (c)**. For the heat of solution of solid thorium tetrachloride in water, Chauvenet<sup>2</sup> found 56.7 at 15° and von Wartenberg 53. For the heat of formation of ThCl<sub>4</sub> (c) by direct synthesis from a very impure sample of thorium, von Wartenberg<sup>6</sup> reported  $Q_f = 300$ .

**ThCl<sub>4</sub> · nH<sub>2</sub>O (c)**. Chauvenet<sup>2</sup> measured the heats of solution of the di-, tetra-, penta-, and octahydrates.

**Th<sup>+++</sup> (aq.)**. This value is obtained from ThCl<sub>4</sub> (aq.).

**ThCl<sub>3</sub>OH · H<sub>2</sub>O (c)**. Chauvenet<sup>2</sup> measured the heat of solution.

**ThOCl<sub>2</sub> (c)**. Chauvenet<sup>2</sup> measured the heat of solution.

**Th(OH)<sub>4</sub> (c, "soluble")**. Chauvenet<sup>2</sup> measured the heat of solution in HCl(15).

**Th(OH)<sub>4</sub> (c, "insoluble")**. Chauvenet<sup>2</sup> measured the heat of solution in HCl(15).

**ThBr<sub>4</sub> (aq.)**. This value is obtained from the ions.

**ThBr<sub>4</sub> (c).** Chauvenet<sup>2</sup> measured the heat of solution.

**ThBr<sub>4</sub> · nH<sub>2</sub>O (c).** Chauvenet<sup>2</sup> measured the heats of solution of the hepta-, deca-, and dodecahydrates.

**ThOBr<sub>2</sub> (c).** Chauvenet<sup>2</sup> measured the heat of solution.

**ThI<sub>4</sub> (aq.).** This value is obtained from the ions.

**ThOI<sub>2</sub> (c).** Chauvenet<sup>2</sup> measured the heat of solution.

**ThOI<sub>2</sub> · 3½ H<sub>2</sub>O (c).** Chauvenet<sup>2</sup> measured the heat of solution.

**ThI<sub>3</sub>OH · 10 H<sub>2</sub>O (c).** Chauvenet<sup>2</sup> measured the heat of solution.

**Th(SO<sub>4</sub>)<sub>2</sub> (aq.).** This value is obtained from the ions.

**Th(SO<sub>4</sub>)<sub>2</sub> (c).** Beck<sup>1</sup> reported the improbably low value of 22.5 for the heat of reaction of solid thorium sulfate with aqueous sodium hydroxide. From his data, Beck derived in some unstated manner the value 115.5 for the heat of the reaction of ThO<sub>2</sub> (c) with 2 SO<sub>3</sub> (g). These values yield, for Th(SO<sub>4</sub>)<sub>2</sub> (c),  $Q_f = 526.9$  and 596 respectively. We have estimated the value 632.

**Th(SO<sub>4</sub>)<sub>2</sub> · nH<sub>2</sub>O (c).** Koppel<sup>1</sup> determined the heat of hydration of the tetra- to the octahydrate from measurement of their heats of solution in aqueous potassium carbonate, and also from solubility measurements. The latter data yield 5.0 and -7.5 for the heats of solution of the tetra- and octahydrates.

**ThOSO<sub>4</sub> (c).** Wohler, Pluddemann, and Wohler<sup>1</sup> obtained dissociation pressure data on the reaction, ThO<sub>2</sub> · 2 SO<sub>3</sub> (c) = ThO<sub>2</sub> · SO<sub>3</sub> (c) + SO<sub>3</sub> (g).

**Th<sub>3</sub>N<sub>4</sub> (c).** Neumann, Kroger, and Haebler<sup>3</sup> determined the heat of formation of this compound.

**ThCl<sub>4</sub> · 2 NH<sub>4</sub>Cl · nH<sub>2</sub>O (c).** Chauvenet<sup>1, 2</sup> measured the heats of solution of the anhydrous double salt and of the decahydrate.

**ThCl<sub>4</sub> · nNH<sub>3</sub> (c).** Chauvenet<sup>1, 2</sup> measured the heats of solution in aqueous HCl of these regular amines with  $n = 4, 6, 7, 12$ , and 18.

**[Th · 6 NH<sub>3</sub>]Cl<sub>4</sub> · nNH<sub>3</sub> (c).** Chauvenet<sup>1, 2</sup> measured the heats of solution in aqueous HCl of these "coordination valence" amines with  $n = 0, 1, 6$ , and 12.

**ThC<sub>2</sub> (c).** From equilibrium studies, Prescott and Hincke<sup>1</sup> computed  $Q^{25} = -194.8$  for the reaction, ThO<sub>2</sub> (c) + 4 C (c) = ThC<sub>2</sub> (c) + 2 CO (g).

## BORON

**B (c).** Standard state.

**B (g).** We have estimated the heat of vaporization. The energy states of gaseous monatomic boron have been evaluated from the data of Bowen,<sup>2</sup> Sawyer and Smith,<sup>1</sup> Millikan,<sup>1</sup> and Bowen and Millikan.<sup>5</sup>

**BO (g).** Mulliken<sup>6</sup> reported a value for the energy of dissociation.

**BO<sub>2</sub><sup>-</sup> (aq.), BO<sub>3</sub><sup>3-</sup> (aq.), B<sub>4</sub>O<sub>7</sub><sup>-</sup> (aq.).** The values for these ions are obtained from those for the respective sodium salts in aqueous solution.

**B<sub>2</sub>O<sub>3</sub> (gls.).** For the heat of solution of this substance, Berthelot<sup>50</sup> reported 7.3, Ditte<sup>1</sup> gave 3.16. Mulert<sup>1</sup> found 29.6 for its heat of solution in aqueous HF.

**B<sub>2</sub>O<sub>3</sub> (aq.).** This is taken as equivalent to 2 H<sub>3</sub>BO<sub>3</sub> (aq.) - 3 H<sub>2</sub>O (liq.).

**BH (g).** Mulliken<sup>6</sup> reported a value for the energy of dissociation.

**B<sub>2</sub>H<sub>6</sub> (g).** Stelzner and Niederschulte<sup>1</sup> obtained vapor pressure data.

**HBO<sub>2</sub> (c).** Gilbert and Levi<sup>1</sup> obtained dissociation pressure data on B<sub>2</sub>O<sub>3</sub> · H<sub>2</sub>O (c) (= 2 HBO<sub>2</sub> (c)).

**H<sub>3</sub>BO<sub>3</sub> (aq.).** The data of Troost and Hautefeuille<sup>4, 5</sup> on the heat of solution of BCl<sub>3</sub> (g) in water yield  $Q = 70.3$ , when corrected according to Berthelot.<sup>50, 151</sup> Berthelot<sup>50, 151</sup> measured the heat of solution of BCl<sub>3</sub> (liq.) in water to be 65.8 at 10°.

**H<sub>3</sub>BO<sub>3</sub> (c).** The data on the heat of solution are: Thomsen,<sup>15</sup> -5.39<sub>400</sub>; Berthelot,<sup>52</sup> -4.8<sub>200</sub><sup>15</sup>; Ditte,<sup>1</sup> -3.2; Linderstrom-Lang,<sup>1</sup> -5.0. See also Favre and Valson.<sup>2</sup>

**H<sub>2</sub>B<sub>4</sub>O<sub>7</sub> (c).** Gilbert and Levi<sup>1</sup> measured the dissociation pressures of 2 B<sub>2</sub>O<sub>3</sub> · H<sub>2</sub>O (c).

**H<sub>2</sub>B<sub>6</sub>O<sub>10</sub> (c).** Gilbert and Levi<sup>1</sup> measured the dissociation pressures of 3 B<sub>2</sub>O<sub>3</sub> · H<sub>2</sub>O (c).

**nB<sub>2</sub>O<sub>3</sub> · H<sub>2</sub>O (c).** Gilbert and Levi<sup>1</sup> reported dissociation pressure data on these hydrates with  $n = 4, 5, 6, 7$ , and 8, but the existence of these as definite compounds has not been fully established.

**BF<sub>3</sub> (aq.).** Thomsen<sup>15</sup> measured the heat of mixing H<sub>3</sub>BO<sub>3</sub> (aq.) with 3 HF (aq.).

**HBf<sub>4</sub> (aq.).** Thomsen<sup>15</sup> measured the heat of mixing H<sub>3</sub>BO<sub>3</sub> (aq.) with 4 HF (aq.).

**BF<sub>4</sub><sup>-</sup> (aq.).** The heat of ionization of aqueous HBF<sub>4</sub> is assumed to be zero.

**BF<sub>3</sub> (g).** Hammerl<sup>2</sup> measured the heat of solution of this gas.

**BF<sub>3</sub> (liq.).** Ruff and Bretschneider<sup>1</sup> measured the vapor pressure of the liquid. See also LeBoucher, Fischer, and Biltz.<sup>1</sup>

**BCl<sub>3</sub> (g).** The data of Troost and Hautefeuille<sup>4, 5</sup> corrected according to Berthelot,<sup>50, 151</sup> yield for the reaction, B (c) + 1½ Cl<sub>2</sub> (g) = BCl<sub>3</sub> (g),  $Q = 89.1$ .

**BCl<sub>3</sub> (liq.).** For the heat of vaporization of the liquid, Berthelot<sup>50</sup> reported -4.5<sup>10</sup>; the vapor pressure data of Stock and Priess<sup>1</sup> yield -6.34 at 18°.

**BBr<sub>3</sub> (liq.).** Berthelot<sup>50, 151</sup> measured the heat of reaction of BBr<sub>3</sub> (liq.) with 400 H<sub>2</sub>O to be 83.8 at 11°.

**BBr<sub>3</sub> (g).** Stock and Russ<sup>1</sup> measured the vapor pressure of the liquid.

**B<sub>2</sub>H<sub>5</sub>Br (liq.).** Stock, Russ, and Priess<sup>1</sup> measured the vapor pressure.

**B(CH<sub>3</sub>)<sub>3</sub> (liq.).** Stock and Zeidler<sup>1</sup> measured the vapor pressure.

**B<sub>2</sub>S<sub>3</sub> (c).** Sabatier<sup>3, 6</sup> measured the heat of solution of this substance. See also Stock and Pappenberg.<sup>1</sup>

**NH<sub>4</sub>BO<sub>2</sub> (aq.).** Berthelot<sup>4</sup> measured the heat of reaction of NH<sub>3</sub> (aq.) with H<sub>3</sub>BO<sub>3</sub> (aq.) to be 8.93.

$(\text{NH}_4)_2\text{HBO}_3$  (aq.). Berthelot<sup>4</sup> measured the heat of reaction of 2  $\text{NH}_3$  (aq.) with  $\text{H}_3\text{BO}_3$  (aq.) to be 11.55.

$(\text{NH}_4)_3\text{BO}_3$  (aq.). Berthelot<sup>4</sup> measured the heat of reaction of 3  $\text{NH}_3$  (aq.) with  $\text{H}_3\text{BO}_3$  (aq.) to be 12.62.

$\text{CuB}_2\text{O}_4$  (c). Parravano and Malquori<sup>4</sup> studied the equilibrium,  $6 \text{CuB}_2\text{O}_4$  (c) =  $3 \text{Cu}_2\text{O} \cdot 2 \text{B}_2\text{O}_3$  (c) +  $4 \text{B}_2\text{O}_3$  (c) +  $1\frac{1}{2} \text{O}_2$  (g).

$\text{NH}_4\text{BO}_3$  (c). Tanatar<sup>9</sup> measured the heat of decomposition of ammonium perborate with sulfuric acid, and also its heat of solution.

## ALUMINUM

Al (c). Standard state. Laschtschenko<sup>5</sup> reported a transition at  $590^\circ$ , but this has not been confirmed.

Al (liq.). The data on the heat of fusion at  $658^\circ$  are: Pionchon,<sup>1</sup>  $-2.13$ ; Laschtschenko,<sup>6</sup>  $-1.92$ ; Wust, Meuthen, and Durrer,<sup>1</sup>  $-2.54$ .

Al (g). We have estimated the heat of sublimation. See also Sherman<sup>1</sup> and Millar.<sup>1</sup> The energy states of gaseous monatomic aluminum have been evaluated from the data of Fowler,<sup>3</sup> Sawyer and Paschen,<sup>1</sup> Paschen,<sup>6</sup> Lyman,<sup>1</sup> and Soderquist.<sup>1, 2</sup>

$\text{Al}_2\text{O}_3$  (c). Berthelot,<sup>127</sup> Moose and Parr,<sup>1</sup> and Roth and Muller<sup>4</sup> measured the heat of combustion of aluminum in oxygen in a bomb. The data of the latter two modern investigations yield, for  $\text{Al}_2\text{O}_3$  (c),  $Q_f = 376.9$  and  $380.1$ , respectively. See also Mixer<sup>16</sup> and Baille and Fery.<sup>1</sup>

$\text{Al}_2\text{O}_3$  (g). Vapor pressure data were obtained by Ruff and Konshak.<sup>1</sup> See also Ruff and Schmidt<sup>1</sup> and Millar.<sup>1</sup>

AlH (g). Bengtsson and Rydberg<sup>2</sup> reported the energy of dissociation. See also Villars and Condon.<sup>1</sup>

$\text{AlCl}_3$  (aq.). The heat of solution of aluminum in aqueous hydrochloric acid was measured by Sommermeier,<sup>1</sup> Richards and Burgess,<sup>1</sup> Biltz and Hohorst,<sup>1</sup> and Richards, Rowe, and Burgess.<sup>1</sup> The data of the last named investigation yield, for  $\text{AlCl}_3$  (600),  $Q_f = 244.7$ .

$\text{Al}^{+++}$  (aq.). This value is obtained from that for  $\text{AlCl}_3$  (aq.). See also Latimer.<sup>1</sup>

$\text{AlCl}_3$  (c). The data on the heat of solution of this substance in water are: Thomsen,<sup>15</sup>  $76.85_{1250}$ ; Berthelot,<sup>50</sup>  $76.3^9$ ; Baud,<sup>1, 2</sup>  $77.6_{3000}^{14}$ ; Sabatier,<sup>2</sup>  $78$ .

$\text{AlCl}_3$  (liq.). Maier<sup>1</sup> reported a value for the heat of fusion.

$\text{Al}_2\text{Cl}_6$  (g). The vapor of aluminum chloride is completely associated at low temperatures. The vapor pressure data of Maier<sup>1</sup> yield  $-27.5$  for the heat of sublimation at  $100^\circ$ .

$\text{AlCl}_3$  (g). The meager vapor density data of Nilson and Patterson<sup>2</sup> yield about  $-40$  for the heat of the reaction,  $\text{Al}_2\text{Cl}_6$  (g) =  $2 \text{AlCl}_3$  (g).

$\text{AlCl}_3 \cdot 6 \text{H}_2\text{O}$  (c). Sabatier<sup>2</sup> measured the heat of solution.

$\text{Al}(\text{OH})_3$  (c). Baud,<sup>1</sup> Berthelot,<sup>50</sup> and Thomsen<sup>15</sup> measured the heat of reaction of  $\text{AlCl}_3$  (aq.) with 3  $\text{NH}_4\text{OH}$  (aq.).

$\text{AlF}_3$  (aq.). Petersen<sup>4</sup> and Mulert<sup>1</sup> measured the heats of mixing  $\text{AlCl}_3$  (aq.) with 3  $\text{HF}$  (aq.) and  $\text{AlF}_3$  (aq.) with 3  $\text{HCl}$  (aq.).

$\text{H}_3\text{AlF}_6$  (aq.). Berthelot<sup>151</sup> and Mulert<sup>1</sup> measured the heat of mixing  $\text{AlF}_3$  (aq.) with  $3\text{HF}$  (aq.).

$\text{AlF}_3$  (c). Baud<sup>1</sup> estimated the heat of solution.

$\text{AlF}_3 \cdot n\text{H}_2\text{O}$  (c). Baud<sup>1</sup> measured the heats of solution, in aqueous (19%)  $\text{HF}$ , of the hemihydrate and the "soluble" and "insoluble" forms of the hydrate with  $3\frac{1}{2}\text{H}_2\text{O}$ .

$\text{AlBr}_3$  (aq.). Berthelot<sup>50</sup> measured the heat of reaction of this solution with  $3\text{NH}_4\text{OH}$  (aq.). See also Roos.<sup>2</sup>

$\text{AlBr}_3$  (c). For the heat of solution, Berthelot<sup>50</sup> found  $85.3_{3000}^9$  and Gustavson<sup>1</sup> 90.0.

$\text{AlBr}_3$  (liq.). For the heat of fusion of aluminum bromide, Fischer<sup>2</sup> found  $-2.7$  at  $98^\circ$  and Pickering<sup>12</sup>  $-2.17$  at  $95^\circ$ .

$\text{AlI}_3$  (aq.). This value is obtained from those for the ions.

$\text{AlI}_3$  (c). Berthelot<sup>50</sup> measured the heat of solution.

$\text{AlI}_3$  (liq.). Fischer<sup>2</sup> reported a value for the heat of fusion.

$\text{Al}_2\text{S}_3$  (c). Sabatier<sup>1</sup> measured the heat of the reaction,  $\text{Al}_2\text{S}_3$  (c) +  $6\text{H}_2\text{O}$  (liq.) =  $2\text{Al}(\text{OH})_3 + 3\text{H}_2\text{S}$  (g), to be 75.0.

$\text{Al}_2(\text{SO}_4)_3$  (aq.). Thomsen<sup>15</sup> measured the heat of reaction of  $\text{Al}_2(\text{SO}_4)_3$  (aq.) with  $3\text{BaCl}_2$  (aq.) and with  $6\text{KOH}$  (aq.).

$\text{Al}_2(\text{SO}_4)_3$  (c). Wohler, Pluddemann, and Wohler<sup>1</sup> measured the dissociation pressure of  $\text{Al}_2\text{O}_3 \cdot 3\text{SO}_3$  (c) at various temperatures, and their data yield, for  $\text{Al}_2(\text{SO}_4)_3$  (c),  $Q_f = 713$ . We have estimated, from the heat of dehydration of the hexahydrate, for  $\text{Al}_2(\text{SO}_4)_3$  (c),  $Q_f = 770$ .

$\text{Al}_2(\text{SO}_4)_3 \cdot n\text{H}_2\text{O}$  (c). Favre and Silbermann<sup>3</sup> measured the heat of solution of the hexahydrate, and Favre and Valson<sup>2</sup> that of the octadecahydrate.

$\text{AlCl}_3 \cdot n\text{SO}_2$  (c). Baud<sup>1</sup> measured the heats of solution of these compounds with  $\frac{1}{2}$  and 1 mole of  $\text{SO}_2$ , respectively.

$\text{AlX}_3 \cdot n\text{H}_2\text{S}$  (c). Biltz and Keuncke<sup>1</sup> obtained dissociation pressure data on  $\text{AlCl}_3 \cdot \text{H}_2\text{S}$  (c),  $\text{AlBr}_3 \cdot \text{H}_2\text{S}$  (c),  $\text{AlI}_3 \cdot 4\text{H}_2\text{S}$  (c), and  $\text{AlI}_3 \cdot \text{H}_2\text{S}$  (c). Baud<sup>1</sup> measured the heat of solution of  $\text{AlCl}_3 \cdot \frac{1}{2}\text{H}_2\text{S}$  (c).

$\text{AlN}$  (c). The data of Fichter and Jenny,<sup>1</sup> who measured the heats of combustion of  $\text{Al}$  (c) and  $\text{AlN}$  (c), yield, for the latter,  $Q_f = 23$ . Matignon<sup>13</sup> estimated  $Q_f = 110$ . The data of Prescott and Hincke,<sup>1, 2</sup> who studied the equilibria,  $2\text{Al}_2\text{O}_3$  (c) +  $9\text{C}$  (c) =  $\text{Al}_4\text{C}_3$  (c) +  $6\text{CO}$  (g) and  $4\text{AlN}$  (c) +  $3\text{C}$  (c) =  $\text{Al}_4\text{C}_3$  (c) +  $2\text{N}_2$  (g), yield, for  $2\text{Al}_2\text{O}_3$  (c) +  $6\text{C}$  (c) +  $2\text{N}_2$  (g) =  $6\text{CO}$  (g) +  $4\text{AlN}$  (c),  $Q = -277$ , and for  $\text{AlN}$  (c),  $Q_f = 80$ .

$\text{AlF}_3 \cdot 2\text{NH}_4\text{F} \cdot 1\frac{1}{2}\text{H}_2\text{O}$  (c). Baud<sup>1</sup> measured the heat of solution.

$\text{AlCl}_3 \cdot n\text{NH}_3$  (c). Klemm and Tanke<sup>1</sup> reported the following heats of dissociation, from dissociation pressure data, per mole of gaseous ammonia, to the next lower ammine: tetradecamine,  $-7.8$ ; heptamine,  $-10.2$ ; hexamine,  $-13.1$ ; pentamine,  $-17.7$ . Klemm and Tanke<sup>1</sup> measured the following heats of solution in  $\text{HCl}(20)$  at  $0^\circ$ : Hexamine, 73.4; pentamine, 65.1; triamine, 58.0; monamine, 60.3. Baud<sup>1</sup> reported the following heats of solution in water at  $15^\circ$ : hexamine,

6.35<sub>2400</sub>; pentammine, 9.05<sub>2200</sub>; triammine, 30.3<sub>2000</sub>; monammine, 53.05. Baud<sup>1</sup> reported 7.94 for the heat of solution and -8.27 for the heat of dissociation of the nonammine, but the existence of this compound is doubtful. See also Ephraim and Millman.<sup>1</sup>

$\text{AlCl}_3 \cdot \text{NH}_4\text{Cl} \cdot 6 \text{NH}_3$  (c). Baud<sup>1</sup> measured the heat of solution.

$\text{AlCl}_3 \cdot \text{NH}_4\text{Cl}$  (c). Baud<sup>1</sup> measured the heat of solution.

$\text{AlBr}_3 \cdot n\text{NH}_3$  (c). Klemm and Tanke<sup>1</sup> reported the following heats of dissociation: tetradecammine, -7.72; nonammine, -8.4; heptammine, -10.7; hexammine, -16.2. Klemm and Tanke<sup>1</sup> measured the following heats of solution in  $\text{HBr}(20)$  at  $0^\circ$ : hexammine, 66.4; pentammine, 60.2; triammine, 57.7; monammine, 66.9. See also Ephraim and Millman.<sup>1</sup>

$\text{AlI}_3 \cdot n\text{NH}_3$  (c). Klemm and Tanke<sup>1</sup> reported dissociation pressure data on the amines with 20, 13, 9, and 7  $\text{NH}_3$ . Klemm and Tanke<sup>1</sup> measured the heats of solution in  $\text{HI}(20)$  at  $0^\circ$  of the amines with 6, 5, 3, and 1  $\text{NH}_3$ . See also Ephraim and Millman.<sup>1</sup>

$\text{NH}_4\text{Al}(\text{SO}_4)_2 \cdot n\text{H}_2\text{O}$  (c). Favre and Silbermann<sup>8</sup> measured the heat of solution of the dodecahydrate. Ephraim and Wagner<sup>1</sup> obtained dissociation pressure data on the system, dodecahydrate-pentahydrate-water vapor, finding  $D = -14.4$ .

$\text{AlX}_3 \cdot \text{PH}_3$  (c). Holtje<sup>1</sup> obtained dissociation pressure data on the chloride, bromide, and iodide.

$\text{Al}_4\text{C}_3$  (c). Prescott and Hincke<sup>1, 2</sup> studied the equilibrium,  $2 \text{Al}_2\text{O}_3$  (c) + 9 C (c) =  $\text{Al}_4\text{C}_3$  (c) + 6 CO (g), and calculated  $Q = -539$ ; whence, for  $\text{Al}_4\text{C}_3$  (c),  $Q_f = 60$ . See also Berthelot.<sup>126</sup>

$\text{Al}_2\text{SiO}_5$  (c). Neumann<sup>2</sup> measured the heats of solution of andalusite, disthene, and sillimanite in aqueous (20%) HF.

$3 \text{Al}_2\text{O}_3 \cdot 2 \text{SiO}_2$  (c). Neumann<sup>2</sup> measured the heat of solution of mullite in aqueous (20%) HF.

$2 \text{AlCl}_3 \cdot 3 \text{PbI}_2 \cdot n\text{H}_2\text{O}$  (c). Mosnier<sup>1</sup> measured the heats of solution of the anhydrous salt and the decahydrate.

$\text{AlCl}_3 \cdot \frac{3}{2} \text{ZnCl}_2$  (c). Baud<sup>1</sup> measured the heat of solution.

$\text{AlCl}_3 \cdot \text{AgCl}$  (c). Baud<sup>1</sup> measured the heat of solution.

$\text{AlCu}_n$  (c). Rolla<sup>2</sup> measured the heats of solution in bromine water of  $\text{AlCu}$  (c),  $\text{Al}_2\text{Cu}$  (c), and  $\text{AlCu}_3$  (c) to be 181.4, 365.9, and 303.7, respectively; for  $\text{Al}_2\text{Cu}$  (c), Roos<sup>2</sup> found 423.

$\text{Al}_3\text{Fe}$  (c). Biltz and Haase<sup>1</sup> measured the heat of solution in  $\text{HCl}(8)$ .

$\text{Al}_n\text{Co}$  (c). Biltz and Haase<sup>1</sup> measured the heat of solution in  $\text{HCl}(8)$  of  $\text{AlCo}$  (c) and  $\text{Al}_5\text{Co}$  (c).

## SCANDIUM

Sc (c). Standard state.

Sc (g). We have estimated the heat of sublimation. The values of the energy states of gaseous monatomic scandium are from Russell and Meggers.<sup>1</sup>

$\text{Sc}_2\text{O}_3$  (c). Roth and Becker<sup>3</sup> estimated  $Q_f = 407$ .

$\text{ScCl}_3$  (c). Roth and Becker<sup>3</sup> estimated  $Q_f = 202$ .

## YTTRIUM

**Y (c).** Standard state.

**Y (g).** We have estimated the heat of sublimation. The values for the energy states of gaseous monatomic yttrium are from Meggers and Russell.<sup>1</sup>

**YCl<sub>3</sub> (c).** We have estimated the value for the heat of formation of this substance to be 240. Roth and Becker<sup>3</sup> estimated 243.

**YCl<sub>3</sub> (aq.).** Matignon<sup>7</sup> measured the heat of solution of solid yttrium chloride.

**Y<sub>2</sub>(SO<sub>4</sub>)<sub>3</sub> (aq.).** Thomsen<sup>15</sup> measured the heat of reaction of this solution with 3 BaCl<sub>2</sub> (aq.).

**Y<sub>2</sub>(SO<sub>4</sub>)<sub>3</sub> · 8 H<sub>2</sub>O (c).** Thomsen<sup>15</sup> measured the heat of solution.

**Y(OH)<sub>3</sub> (c).** Thomsen<sup>15</sup> measured the heat of reaction of aqueous yttrium sulfate with aqueous barium hydroxide.

**Y<sub>2</sub>O<sub>3</sub> (c).** Roth and Becker<sup>3</sup> estimated  $Q_f = 441$ .

**Y<sup>+++</sup> (aq.).** This value is obtained from that for aqueous yttrium chloride.

## LUTECIUM

**Lu (c).** Standard state.

## YTTERBIUM

**Yb (c).** Standard state.

## THULIUM

**Tm (c).** Standard state.

## ERBIUM

**Er (c).** Standard state.

**Er<sup>+++</sup> (aq.).** We have estimated the value for aqueous erbium ion.

**Er(C<sub>2</sub>H<sub>3</sub>O<sub>2</sub>)<sub>3</sub> (aq.).** The value for aqueous erbium acetate is obtained from the ions.

**Er(OH)<sub>3</sub> (c, ppt.).** Thomsen<sup>15</sup> measured the heat of reaction of Er (C<sub>2</sub>H<sub>3</sub>O<sub>2</sub>)<sub>3</sub> (1500) with 1½ Ba(OH)<sub>2</sub> (400) to be 12.8.

**Er(C<sub>2</sub>H<sub>3</sub>O<sub>2</sub>)<sub>3</sub> · 4 H<sub>2</sub>O (c).** Thomsen<sup>15</sup> measured the heat of solution.

## HOLMIUM

**Ho (c).** Standard state.

## DYSPROSIUM

**Dy (c).** Standard state.

## TERBIUM

**Tb (c).** Standard state.

## GADOLINIUM

**Gd (c).** Standard state.

## EUROPIUM

**Eu (c).** Standard state.

## SAMARIUM

**Sa (c).** Standard state.

**Sa<sup>+++</sup> (aq.).** We have estimated the value for aqueous samarium ion.

**SaCl<sub>3</sub> (aq.).** This value is obtained from those for the ions.

**SaCl<sub>3</sub> (c).** Matignon<sup>5</sup> measured the heat of solution.

**Sa<sub>2</sub>O<sub>3</sub> (c).** Matignon<sup>5</sup> measured the heat of solution of the regular oxide to be 94.6 in HCl (aq.), and that of the oxide prepared from the oxalate to be 90 in HCl (aq.).

**SaCl<sub>3</sub> · nNH<sub>3</sub> (c).** Matignon and Trannoy<sup>1</sup> obtained dissociation pressure data on the ammines with 1, 2, 3, 4, 5, 8, 9½, and 11½ NH<sub>3</sub>.

## ILLINIUM

**Il (c).** Standard state.

## NEODYMIUM

**Nd (c).** Standard state.

**Nd<sub>2</sub>O<sub>3</sub> (c).** Muthmann and Beck<sup>1</sup> measured the heat of combustion of neodymium to be 434.8. We have labeled this the "high temperature" form, and have estimated the heat of formation of the "low temperature" form (as prepared from neodymium nitrate, for example) to be 427.

**NdCl<sub>3</sub> (aq.).** Matignon<sup>8, 17</sup> measured the heat of solution of Nd<sub>2</sub>O<sub>3</sub> (c, "low temperature"), prepared from the nitrate, to be 105.5 in HCl(110).

**Nd<sup>+++</sup> (aq.).** This value is obtained from that of aqueous neodymium chloride.

**NdCl<sub>3</sub> (c).** Matignon<sup>8, 17</sup> measured the heat of solution.

**NdCl<sub>3</sub> · 6 H<sub>2</sub>O (c).** Matignon<sup>8, 17</sup> measured the heat of solution.

**NdI<sub>3</sub> (aq.).** Matignon<sup>8, 17</sup> measured the heat of solution of Nd<sub>2</sub>O<sub>3</sub> (c, "low temperature"), prepared from the nitrate, to be 106.1 in HI(110).

**NdI<sub>3</sub> (c).** Matignon<sup>8, 17</sup> measured the heat of solution.

**Nd<sub>2</sub>(SO<sub>4</sub>)<sub>3</sub> (aq.).** Matignon<sup>8, 17</sup> measured the heat of solution of Nd<sub>2</sub>O<sub>3</sub> (c, "low temperature"), prepared from the nitrate, to be 106.4 in H<sub>2</sub>SO<sub>4</sub>(220).

**Nd<sub>2</sub>(SO<sub>4</sub>)<sub>3</sub> · nH<sub>2</sub>O (c).** Matignon<sup>8, 17</sup> measured the heats of solution of the anhydrous salt and the penta- and octahydrates.

**Nd<sub>2</sub>S<sub>3</sub> (c).** Matignon<sup>8, 17</sup> measured the heat of solution of this sulfide in HCl(110).

**NdCl<sub>3</sub> · nNH<sub>3</sub> (c).** Matignon and Trannoy<sup>1</sup> obtained dissociation pressure data on the ammines with 1, 2, 4, 5, 8, 11, and 12 NH<sub>3</sub>.

## PRASEODYMIUM

**Pr (c).** Standard state.

**PrCl<sub>3</sub> (aq.).** Sieverts and Gotta<sup>2</sup> measured the heat of solution of praseodymium in HCl(25) to be 168.9.

**Pr<sup>+++</sup> (aq.).** This value is obtained from PrCl<sub>3</sub> (aq.).

**PrCl<sub>3</sub> (c).** Matignon<sup>5</sup> measured the heat of solution.

$\text{PrCl}_3 \cdot n\text{H}_2\text{O}$  (c). Matignon<sup>5</sup> measured the heats of solution of the mono- and heptahydrates.

$\text{Pr}_2\text{O}_3$  (c). Matignon<sup>5</sup> measured the heat of solution of this oxide in aqueous hydrochloric acid to be 106.2. By direct combustion of praseodymium, Muthmann and Beck<sup>1</sup> found  $Q_f = 417$ .

$\text{Pr}(\text{NO}_3)_3$  (aq.). Prandtl and Huttner<sup>1</sup> measured the heat of solution of  $\text{Pr}_2\text{O}_3$  (c) in  $\text{HNO}_3$  (6) to be 109.5.

$\text{PrO}_2$  (c),  $\text{Pr}_6\text{O}_{11}$  (c). Prandtl and Huttner<sup>1</sup> measured the heats of solution of these oxides in  $\text{HNO}_3$  (6). The products of the reaction were aqueous praseodymium nitrate and gaseous oxygen.

#### CERIUM

$\text{Ce}$  (c). Standard state.

$\text{CeO}_2$  (c). For the heat of combustion of cerium to form  $\text{CeO}_2$  (c), the data of Moose and Parr,<sup>1</sup> Muthmann and Weiss,<sup>1</sup> and Hirsch<sup>1</sup> yield 233.4, 226, and 245, respectively.

$\text{CeCl}_3$  (aq.). The data on the heat of solution of cerium in aqueous hydrochloric acid are: Biltz and Pieper,<sup>1</sup> 164.9 in  $\text{HCl}$  (20), 166.4 in  $\text{HCl}$  (8); Neumann, Kroger, and Kunz,<sup>1</sup> 165.2 in  $\text{HCl}$  (20); Sieverts and Gotta,<sup>2</sup> 168.7 in  $\text{HCl}$  (25).

$\text{CeCl}_3$  (c). The heat of solution has been estimated by us.

$\text{Ce}_3\text{H}_8$  (c). Sieverts and Gotta<sup>2</sup> measured the heats of solution of  $\text{Ce}$  (c) in  $\text{HCl}$  (25) and of  $\text{Ce}_3\text{H}_8$  (c) in  $\text{HCl}$  (50).

$\text{Ce}^{+++}$  (aq.). This value is obtained from that for aqueous  $\text{CeCl}_3$ .

$\text{Ce}(\text{OH})_3\text{OOH}$  (c). Pissarjewsky<sup>1</sup> measured the heat of reaction of this hydrated peroxide with aqueous sulfuric acid to be 30.0. The reaction is  $2 \text{Ce}(\text{OH})_3\text{OOH}$  (c) +  $3 \text{H}_2\text{SO}_4$  (aq.) =  $(\text{Ce}_2(\text{SO}_4)_3 + \text{H}_2\text{O}_2)$  (aq.) +  $6 \text{H}_2\text{O}$  (liq.) +  $\text{O}_2$  (g).

$\text{Ce}_2(\text{SO}_4)_3$  (aq.). Thomsen<sup>15</sup> measured the heat of reaction of this solution with  $3 \text{BaCl}_2$  (aq.).

$\text{Ce}(\text{SO}_4)_2$  (c). Beck<sup>1</sup> reported the value for the heat of the reaction,  $\text{CeO}_2$  (c) +  $2 \text{SO}_3$  (g) =  $\text{Ce}(\text{SO}_4)_2$  (c), to be 103.5, but there is probably a considerable uncertainty in it.

$\text{Ce}_2(\text{SO}_4)_3 \cdot 4\frac{3}{8}\text{H}_2\text{O}$  (c). Thomsen<sup>15</sup> measured the heat of solution.

$\text{CeN}$  (c). Neumann, Kroger, and Kunz<sup>1</sup> measured the heat of solution in aqueous hydrochloric acid. See also Lipski.<sup>1</sup>

$\text{CeCl}_3 \cdot n\text{NH}_3$  (c). Barre<sup>2</sup> obtained dissociation pressure data on the amines with 2, 4, 8, 12, and 20  $\text{NH}_3$ .

$\text{CeHg}_4$  (c). The dissociation pressure data of Biltz and Meyer<sup>2</sup> yield  $D = -19.9$  per mole of  $\text{Hg}$  (g).

$\text{Ce}_3\text{Al}$  (c). Biltz and Pieper<sup>1</sup> measured the heat of solution in  $\text{HCl}$  (20). See also Zhukov.<sup>2</sup>

$\text{CeAl}_4$  (c). Biltz and Pieper<sup>1</sup> measured the heat of solution in  $\text{HCl}$  (20). Muthmann and Beck<sup>1</sup> reported the heat of combustion to be 832.

$\text{CeZn}_4$  (c). Muthmann and Beck<sup>1</sup> reported the heat of combustion to be 525.

## LANTHANUM

La (c). Standard state.

La (g). We have estimated the heat of sublimation. The values for the energy states of gaseous monatomic lanthanum are from Bacher and Goudsmit.<sup>1</sup>

LaCl<sub>3</sub> (aq.). Neumann, Kroger, and Kunz<sup>1</sup> and Sieverts and Gotta<sup>1</sup> measured the heat of solution of lanthanum to be, respectively, 167.7 in HCl(20) and 164.5 in HCl(110); whence, for LaCl<sub>3</sub> (aq.),  $Q_f = 284.4$  and 282.7, respectively.

LaCl<sub>3</sub> (c). Matignon<sup>7</sup> measured the heat of solution. See also Beck.<sup>1</sup>

La<sup>+++</sup> (aq.). This value is obtained from that for aqueous lanthanum chloride.

La<sub>2</sub>O<sub>3</sub> (c). For the heat of combustion of lanthanum in oxygen to form La<sub>2</sub>O<sub>3</sub> (c), Moose and Parr,<sup>1</sup> Muthmann and Weiss,<sup>1</sup> and Kremers and Stevens<sup>1</sup> reported 457.0, 445, and 457, respectively. Matignon<sup>7</sup> and Beck<sup>1</sup> measured the heat of solution of La<sub>2</sub>O<sub>3</sub> (c) to be, respectively, 114.6 in HCl(100) at 16° and 105 in HCl(8). These latter data yield, for La<sub>2</sub>O<sub>3</sub> (c),  $Q_f = 423$  and 441, respectively.

La<sub>3</sub>H<sub>8</sub> (c). Sieverts and Gotta<sup>1</sup> measured the heats of solution of La (c) and La<sub>3</sub>H<sub>8</sub> (c) in HCl(110).

La<sub>2</sub>S<sub>3</sub> (c). Biltz<sup>2</sup> measured the heat of solution of this sulfide in HCl(9.4).

LaS<sub>2</sub> (c). Biltz<sup>2</sup> measured the heat of solution of this sulfide in HCl (9.4) to be 31.8.

La<sub>2</sub>(SO<sub>4</sub>)<sub>3</sub> (aq.). Thomsen<sup>15</sup> measured the heat of reaction of this solution with 3 BaCl<sub>2</sub> (aq.).

La<sub>2</sub>(SO<sub>4</sub>)<sub>3</sub> · 8 H<sub>2</sub>O (c). Thomsen<sup>15</sup> measured the heat of solution.

LaN (c). Neumann, Kroger, and Haebler<sup>1</sup> reported  $Q_f = 71.0$ , from direct measurement of the formation, and measured the heat of solution of LaN (c) in HCl(20) to be 127.1. This latter value yields, for LaN (c),  $Q_f = 72.8$ .

LaAl<sub>4</sub> (c). Muthmann and Beck<sup>1</sup> measured the heat of combustion of this alloy.

## ACTINIUM

Ac (c). Standard state.

## BERYLLIUM

Be (c). Standard state.

Be (g). We have estimated the heat of sublimation. The energy states of gaseous monatomic beryllium have been evaluated from the data of Bowen and Millikan,<sup>3,4</sup> Paschen and Kruger,<sup>2</sup> Millikan and Bowen,<sup>4</sup> and Edlen and Ericson.<sup>2</sup>

Be (liq.). Oosterheld<sup>1</sup> reported a value for the heat of fusion.

BeH (g). The data of Watson<sup>1,2</sup> yield values for the energies of excitation and of ionization of gaseous BeH, and for its energy of dissociation into gaseous atoms. See also Mulliken.<sup>6</sup>

**BeO (g).** Bengtsson<sup>1</sup> deduced the energy of dissociation into gaseous atoms, from spectroscopic data.

**BeO (c).** Mielenz and von Wartenberg<sup>1</sup> measured the heat of combustion of beryllium to be 136.0; Moose and Parr<sup>1</sup> found the value to be 134.5. See also Copeaux and Phillips.<sup>1, 2</sup>

**Be(OH)<sub>2</sub> (c).** Matignon and Marchal<sup>4</sup> measured the heat of reaction of the hydroxide with aqueous hydrochloric acid, and of aqueous beryllium chloride with aqueous sodium hydroxide. Thomsen<sup>15</sup> measured the heat of reaction of aqueous beryllium sulfate with aqueous potassium hydroxide.

**BeF<sub>2</sub> (aq.).** For the heat of solution of BeO (c) in aqueous (30%) HF, Matignon and Marchal<sup>4</sup> found 23.3 at 17°, and Copeaux and Phillips<sup>1, 2</sup> found 20.1. For the heat of solution of Be(OH)<sub>2</sub> (c) in aqueous (30%) HF, Matignon and Marchal<sup>4</sup> found 20.35; Mulert,<sup>1</sup> 20.47; and Petersen,<sup>4</sup> 19.7.

**H<sub>2</sub>BeF<sub>4</sub> (aq.).** Matignon and Marchal<sup>4</sup> measured the heat of reaction of Be(OH)<sub>2</sub> (c) with 4 HF (aq.).

**BeCl<sub>2</sub> (c).** Mielenz and von Wartenberg<sup>1</sup> measured the heat of the reaction, Be (c) + Cl<sub>2</sub> (g) = BeCl<sub>2</sub> (c), to be 112.6.

**BeCl<sub>2</sub> (aq.).** The data on the heat of solution of BeCl<sub>2</sub> (c) in water are: Matignon and Marchal,<sup>4</sup> 51.1; Pollok,<sup>1</sup> 44.5. For the heat of solution of BeCl<sub>2</sub> (c) in HCl(9), Biltz and Messerknecht<sup>2</sup> found 44.1, and in HCl (aq.), Biltz, Klatte, and Rahlfs<sup>1</sup> found 48.6.

**Be<sup>++</sup> (aq.).** This value is obtained from those for BeCl<sub>2</sub> (aq.) and BeF<sub>2</sub> (aq.).

**BeCl<sub>2</sub> (g).** Fischer and Rahlfs<sup>2</sup> measured the vapor pressure of the solid.

**BeCl<sub>2</sub>(C<sub>2</sub>H<sub>5</sub>OH).** Pollok<sup>1</sup> measured the heat of solution of solid beryllium chloride in ethyl alcohol.

**BeBr<sub>2</sub> (aq.).** This value is obtained from those for the ions.

**BeBr<sub>2</sub> (c).** Biltz and Messerknecht<sup>2</sup> and Biltz, Klatte, and Rahlfs<sup>1</sup> measured the heat of solution of solid beryllium bromide in aqueous hydrochloric acid.

**BeBr<sub>2</sub> (g).** Fischer and Rahlfs<sup>2</sup> measured the vapor pressure of the solid.

**BeI<sub>2</sub> (aq.).** This value is obtained from those for the ions.

**BeI<sub>2</sub> (c).** Biltz, Klatte, and Rahlfs<sup>1</sup> and Biltz and Messerknecht<sup>2</sup> measured the heat of solution of solid beryllium iodide in aqueous hydrochloric acid.

**BeI<sub>2</sub> (g).** Fischer and Rahlfs<sup>2</sup> measured the vapor pressure of the solid.

**BeSO<sub>4</sub> (aq.).** Thomsen<sup>15</sup> measured the heat of reaction of BeSO<sub>4</sub> (aq.) with BaCl<sub>2</sub> (aq.) to be 6.66; Matignon and Marchal<sup>2</sup> found 6.97.

**BeSO<sub>4</sub> (c).** Matignon and Marchal<sup>2</sup> measured the heat of solution of this solid in aqueous sodium hydroxide. Marchal<sup>2, 5</sup> measured the dissociation pressure of BeO · SO<sub>3</sub> (c).

**BeSO<sub>4</sub> · nH<sub>2</sub>O (c).** Matignon and Marchal<sup>2</sup> measured the heats of solution of the di- and tetrahydrates in water, and also of the tetrahydrate in aqueous sodium hydroxide. Thomsen<sup>15</sup> measured the heat of solution of the tetrahydrate. Krauss and Gerlach<sup>1</sup> obtained dissociation pressure data on the mono-, di, and tetrahydrates.

**BeX<sub>2</sub> · 2 H<sub>2</sub>S (c).** Blitz and Keunecke<sup>1</sup> measured the dissociation pressures of the bromide and iodide.

**Be(NO<sub>3</sub>)<sub>2</sub> (aq.).** Thomsen<sup>15</sup> measured the heat of reaction of BeSO<sub>4</sub> (aq.) with Ba(NO<sub>3</sub>)<sub>2</sub> (aq.).

**BeX<sub>2</sub> · nNH<sub>3</sub> (c).** Blitz, Klatte, and Rahlfs<sup>1</sup> measured the heats of solution of the tetrammines of the chloride, bromide, and iodide in aqueous hydrochloric acid, and Biltz and Messerknecht<sup>2</sup> obtained similar data with HCl(9). Biltz and Messerknecht<sup>2</sup> obtained dissociation pressure data on the tetra-, hexa-, and dodecammines of the chloride, on the hexa- and decammines of the bromide, and on the hexa- and tridecammines of the iodide.

#### MAGNESIUM

**Mg (c).** Standard state.

**Mg (g).** Wehnelt and Musceleanu<sup>1</sup> measured directly the heat of vaporization of magnesium. Vapor pressure data were obtained by Ditte,<sup>7</sup> Greenwood,<sup>3, 5</sup> von Wartenberg,<sup>4</sup> Ruff and Hartmann,<sup>1</sup> and Hartmann and Schneider.<sup>1</sup> The values of the energy states of gaseous monatomic magnesium are from Fowler,<sup>3</sup> Turner,<sup>1</sup> and Soderqvist.<sup>1</sup>

**Mg (liq.).** Data on the heat of fusion of magnesium were reported by van Aubel,<sup>1</sup> Wehnelt and Musceleanu,<sup>1</sup> Awbery and Griffiths,<sup>1</sup> and Zalesenski and Zulenski.<sup>1</sup>

**MgO (c).** For the heat of combustion of magnesium, the data yield the following values: Moose and Parr,<sup>1</sup> 146.1; Muthmann and Weiss,<sup>1</sup> 143.5; Rogers,<sup>1</sup> 147.0; von Wartenberg,<sup>6</sup> 144.3.

**MgH (g).** Values for the energies of excitation and ionization, and for the energy of dissociation into gaseous atoms, were reported by Hulthen,<sup>1</sup> Watson,<sup>2</sup> and Mulliken.<sup>6</sup>

**Mg(OH)<sub>2</sub> (c, ppt.).** Thomsen<sup>15</sup> measured the heat of reaction of MgSO<sub>4</sub> (aq.) with Ba(OH)<sub>2</sub> (aq.), and of MgSO<sub>4</sub> (aq.) with 2 KOH (aq.). Berthelot<sup>100</sup> measured the heat of reaction of KOH (aq.) with MgSO<sub>4</sub> (aq.) and with MgCl<sub>2</sub> (aq.).

**Mg(OH)<sub>2</sub> (c, brucite).** Mixer's<sup>17</sup> data on the reactions with sodium peroxide yield -9.4 for the heat of the reaction, Mg(OH)<sub>2</sub> (c) = MgO (c, brucite) + H<sub>2</sub>O (liq.). See also Johnston.<sup>5</sup>

**MgF (g).** Johnson<sup>3</sup> reported a value for the energy of dissociation into gaseous atoms.

**MgF<sub>2</sub> (c).** Petersen<sup>3</sup> found  $Q = 29.1$  for the reaction, MgCl<sub>2</sub> (aq.) + 2 AgF (aq.) = MgF<sub>2</sub> (c) + 2 AgCl (c). Guntz<sup>1</sup> found -1.7 for the heat of reaction of MgSO<sub>4</sub> (aq.) with 2 KF (aq.).

**MgCl<sub>2</sub> (aq.).** The following are the data on the heat of solution of magnesium: Richards, Rowe, and Burgess,<sup>1</sup> 110.2 in 2 HCl(200); Rich-

ards and Burgess,<sup>1</sup> 110.15 in 2 HCl(200); Biltz and Pieper,<sup>1</sup> 109.7 in 2 HCl(200) and 111.2 in 2 HCl(20); Tammann and Ohler,<sup>1</sup> 113.1 in 2 HCl(8.7); Blitz and Hohorst,<sup>1</sup> 113.1 in 2 HCl(8); Sieverts and Gotta,<sup>1</sup> 112.1 in 2 HCl(200). Data on the heat of dilution of aqueous magnesium chloride were reported by Thomsen,<sup>15</sup> Fricke and Havestadt,<sup>1</sup> Dunnington and Hoggard,<sup>1</sup> Arrhenius,<sup>2</sup> and Lange and Streeck.<sup>1</sup>

**Mg<sup>++</sup>(∞).** This value is obtained from those for MgCl<sub>2</sub>(∞) and Cl<sup>-</sup>(∞). See also Latimer.<sup>2</sup>

**MgCl<sub>2</sub>(c).** The data on the heat of solution are: Thomsen,<sup>15</sup> 35.90<sub>800</sub>; Berthelot and Ilosvay,<sup>1</sup> 35.5.

**MgCl<sub>2</sub> · nH<sub>2</sub>O(c).** Thomsen's<sup>15</sup> data on the hydrates yield for *S*<sub>400</sub>: dihydrate, 20.4; tetrahydrate, 10.0; hexahydrate, 2.94. Berthelot and Ilosvay<sup>1</sup> and van't Hoff, Kenrick, and Dawson<sup>1</sup> measured the heat of solution of the hexahydrate. Vapor pressure data on the hexahydrate were reported by Lescoeur,<sup>4, 7</sup> Derby and Yngve,<sup>1</sup> and Biltz.<sup>8</sup>

**MgCl<sub>2</sub> · 6 H<sub>2</sub>O(liq.).** Reisenfeld and Milchsach<sup>1</sup> reported the heat of fusion of the hexahydrate.

**MgCl<sub>2</sub> · MgO · nH<sub>2</sub>O(c).** Andre<sup>1</sup> measured the heats of solution of the anhydrous solid and the hexa- and hexadecahydrates, but the order of his values seems irregular.

**MgOHCl(c).** Moldenhauer's<sup>1</sup> data on the equilibrium, MgCl<sub>2</sub>(c) + H<sub>2</sub>O(g) = MgOHCl(c) + HCl(g), yield *Q* = 5.1.

**MgBr<sub>2</sub>(aq.).** The value for MgBr<sub>2</sub>(∞) is obtained from Mg<sup>++</sup>(∞) and Br<sup>-</sup>(∞). Data on the heat of dilution of aqueous magnesium bromide were reported by Lange and Streeck.<sup>1</sup>

**MgBr<sub>2</sub>(c).** Beketoff<sup>5</sup> measured the heat of solution.

**MgBr<sub>2</sub> · nH<sub>2</sub>O(c).** Dissociation pressure data on the di- and hexahydrates were obtained by Lescoeur.<sup>5</sup>

**MgI<sub>2</sub>(aq.).** The value for MgI<sub>2</sub>(∞) is obtained from the ions. Thomsen<sup>15</sup> measured the heat of reaction of BaI<sub>2</sub>(aq.) with MgSO<sub>4</sub>(aq.), and his data yield, for MgI<sub>2</sub>(800), *Q*<sub>f</sub> = 136.6. We have estimated the heat of dilution of aqueous magnesium iodide.

**MgI<sub>2</sub>(c).** Beketoff<sup>5</sup> measured the heat of solution. See also Cambi and Devoto.<sup>1</sup>

**MgSO<sub>4</sub>(aq.).** Thomsen<sup>15</sup> measured the heats of mixing MgCl<sub>2</sub>(200) with H<sub>2</sub>SO<sub>4</sub>(200), and MgSO<sub>4</sub>(200) with 2 HCl(100), to be 0.93 and -2.59, respectively; whence, for MgSO<sub>4</sub>(200), *Q*<sub>f</sub> = 325.28. Thomsen<sup>15</sup> also measured the heat of reaction of MgSO<sub>4</sub>(aq.) with BaCl<sub>2</sub>(aq.). Ditte<sup>5</sup> measured the heat of solution of magnesium in aqueous sulfuric acid. Data on the heat of dilution of aqueous magnesium sulfate were reported by Thomsen,<sup>15</sup> Rümelin,<sup>1</sup> Lange and Messner,<sup>2</sup> and Lange and Streeck.<sup>2</sup>

**MgSO<sub>4</sub>(c).** The data on the heat of solution are: Thomsen<sup>15</sup>, 20.28<sub>400</sub>; Pickering,<sup>3, 5</sup> 20.32<sub>450</sub>. Values were also reported by Berthelot and Ilosvay.<sup>1</sup>

$\text{MgSO}_4 \cdot n\text{H}_2\text{O}$  (c). Thomsen's<sup>15</sup> data yield the following values for  $S_{400}$ : monohydrate, 13.30; dihydrate, 11.05; tetrahydrate, 4.20; pentahydrate, 2.10; hexahydrate, 0.10; heptahydrate, -3.80. Pickering<sup>3, 5</sup> reported the following values for the heats of solution: monohydrate, 12.13<sub>450</sub><sup>22</sup>; heptahydrate, -3.85<sub>450</sub>. Berthelot and Ilosvay,<sup>1</sup> Favre,<sup>7</sup> and Graham<sup>1</sup> reported values for the heat of solution of the monohydrate, and van Deventer and van der Stadt<sup>1</sup> for the heptahydrate. Dissociation pressure data on these hydrates were reported by Frowein,<sup>1</sup> Lescœur,<sup>2, 4</sup> Linebarger,<sup>1</sup> Cohen and Visser,<sup>1</sup> Hollmann,<sup>1</sup> Foote and Scholes,<sup>1</sup> Bolte,<sup>1</sup> Schumb,<sup>1</sup> Carpenter and Jette,<sup>1</sup> and Rolla and Accame.<sup>1</sup> Marchal<sup>15</sup> reported dissociation pressure data on  $\text{MgO} \cdot \text{SO}_3$  (c).

$\text{MgSO}_3 \cdot n\text{H}_2\text{O}$  (c). Hartog<sup>1</sup> measured the heats of solution of the anhydrous salt and the tri- and hexahydrates in  $\text{HCl}$ (220).

$\text{MgS}$  (aq.). Thomsen<sup>15</sup> measured the heat of reaction of  $\text{H}_2\text{S}$  (aq.) with  $\text{Mg}(\text{OH})_2$  (c).

$\text{MgS}$  (c). Sabatier<sup>1</sup> measured the heat of solution of this solid sulfide in aqueous hydrochloric acid.

$\text{Mg}(\text{HS})_2$  (aq.). Thomsen<sup>15</sup> measured the heat of reaction of  $\text{Mg}(\text{OH})_2$  (c) with  $2\text{H}_2\text{S}$  (aq.).

$\text{MgS}_2\text{O}_8$  (aq.). Thomsen<sup>15</sup> measured the heat of reaction of  $\text{MgSO}_4$  (aq.) with  $\text{BaS}_2\text{O}_8$  (aq.).

$\text{MgS}_2\text{O}_8 \cdot 6\text{H}_2\text{O}$  (c). Thomsen<sup>15</sup> measured the heat of solution.

$\text{Mg}_3\text{N}_2$  (c). For the heat of solution of this nitride, Matignon<sup>19</sup> found 279.7 in  $\text{H}_2\text{SO}_4$  (aq.); Moser and Herzner<sup>1</sup> 269.9 in  $\text{H}_2\text{SO}_4$  (aq.); Neumann, Kroger, and Kunz,<sup>1</sup> 284.8 in  $\text{HCl}$ (20); Brunner<sup>1</sup> (see Neumann, Kroger, and Kunz<sup>1</sup>), 177.0 in water. Neumann, Kroger, and Haebler,<sup>2</sup> by direct measurement, found  $Q_f = 116$ . These values yield, respectively, for  $\text{Mg}_3\text{N}_2$  (c),  $Q_f = 137, 127, 112, 108$ , and 116.

$\text{Mg}(\text{NO}_3)_2$  (aq.). Thomsen<sup>15</sup> measured the heat of reaction of  $\text{MgSO}_4$  (200) with  $\text{Ba}(\text{NO}_3)_2$ (200) to be 4.94; whence, for  $\text{Mg}(\text{NO}_3)_2$ (400),  $Q_f = 208.8$ . Data on the heat of dilution of aqueous magnesium nitrate were reported by Thomsen,<sup>15</sup> Dunnington and Hoggard,<sup>1</sup> Lange and Streeck,<sup>2</sup> and Hammerschmid and Lange.<sup>1</sup>

$\text{Mg}(\text{NO}_3)_2 \cdot 6\text{H}_2\text{O}$  (c). For the heat of solution of this hydrate, Thomsen<sup>15</sup> found -4.22<sub>400</sub> and Pickering<sup>8</sup> -4.54<sub>400</sub>.

$\text{Mg}(\text{NO}_3)_2 \cdot 6\text{H}_2\text{O}$  (liq.). Reisenfeld and Milchsack<sup>1</sup> reported the heat of fusion of the hexahydrate.

$\text{MgCl}_2 \cdot n\text{NH}_3$  (c). Dissociation pressure data were reported on the mono- and diammines by Biltz and Hüttig<sup>4</sup> and Biltz, Klatte, and Rahlfs,<sup>1</sup> and on the hexammines by Ephraim,<sup>9</sup> Bonnefoi,<sup>1</sup> and Biltz and Stolnwerk.<sup>2</sup>

$\text{MgCl}_2 \cdot 2\text{NH}_3$  (aq.). Berthelot<sup>100</sup> estimated the heat of mixing  $\text{MgCl}_2$  (aq.) with  $2\text{NH}_3$  (aq.).

$\text{Mg}(\text{NH}_3)_2^{++}$  (aq.). This value is obtained from that for  $\text{MgCl}_2 \cdot 2\text{NH}_3$  (aq.).

$\text{MgBr}_2 \cdot n\text{NH}_3$  (c). Biltz and Hüttig<sup>4</sup> and Biltz, Klatte, and Rahlfs<sup>1</sup>

obtained dissociation pressure data on the mono- and diammines, and Ephraim<sup>9</sup> on the hexammine.

**MgI<sub>2</sub> · nNH<sub>3</sub> (c).** Biltz and Hüttig<sup>4</sup> and Biltz, Klatte, and Rahlfs<sup>1</sup> reported dissociation pressure data on the diammine, and Ephraim<sup>9</sup> on the hexammine.

**3 MgSO<sub>3</sub> · (NH<sub>4</sub>)<sub>2</sub>SO<sub>3</sub> · nH<sub>2</sub>O (c).** Hartog<sup>1</sup> measured the heats of solution in HCl (aq.) of the hexa- and octadecahydrates.

**MgSO<sub>4</sub> · (NH<sub>4</sub>)<sub>2</sub>SO<sub>4</sub> · nH<sub>2</sub>O (c).** Berthelot<sup>151</sup> measured the heat of solution of the hexahydrate. See also Graham.<sup>2</sup> Caven and Ferguson<sup>2</sup> studied the equilibrium, hexahydrate-dihydrate-water vapor.

**Mg<sub>3</sub>(PO<sub>4</sub>)<sub>2</sub> (c, ppt.).** Berthelot<sup>102, 145</sup> measured the heat of the reaction,  $2 \text{Na}_3\text{PO}_4 \text{ (aq.)} + 3 \text{MgSO}_4 \text{ (aq.)} = \text{Mg}_3(\text{PO}_4)_2 \text{ (c, ppt.)} + 3 \text{Na}_2\text{SO}_4 \text{ (aq.)}$ .

**MgHPO<sub>4</sub> (aq.).** Berthelot<sup>102, 145</sup> measured the heat of the reaction of  $\text{MgSO}_4 \text{ (aq.)}$  with  $\text{Na}_2\text{HPO}_4 \text{ (aq.)}$ .

**MgNH<sub>4</sub>PO<sub>4</sub> · 6 H<sub>2</sub>O (c).** Berthelot<sup>102, 145</sup> measured the heat of mixing  $\text{MgCl}_2 \cdot 2 \text{NH}_3 \text{ (aq.)}$  with  $\text{Na}_2\text{HPO}_4 \text{ (aq.)}$ .

**Mg<sub>3</sub>(AsO<sub>4</sub>)<sub>2</sub> (c, ppt.).** Blarez<sup>3</sup> measured the heat of reaction of  $2 \text{H}_3\text{AsO}_4 \text{ (aq.)}$  with  $3 \text{Mg(OH)}_2 \text{ (c)}$ .

**MgHAsO<sub>4</sub> (aq.).** Blarez<sup>3</sup> measured the heat of reaction of  $\text{H}_3\text{AsO}_4 \text{ (aq.)}$  with  $\text{Mg(OH)}_2 \text{ (c)}$ .

**Mg(H<sub>2</sub>AsO<sub>4</sub>)<sub>2</sub> (aq.).** Blarez<sup>3</sup> measured the heat of reaction of  $2 \text{H}_3\text{AsO}_4 \text{ (aq.)}$  with  $\text{Mg(OH)}_2 \text{ (c)}$ .

**MgNH<sub>4</sub>AsO<sub>4</sub> · 6 H<sub>2</sub>O (c).** Berthelot<sup>102, 145</sup> measured the heat of mixing  $\text{MgCl}_2 \cdot 2 \text{NH}_3 \text{ (aq.)}$  with  $\text{H}_3\text{AsO}_4 \text{ (aq.)}$ .

**MgCO<sub>3</sub> (c).** Berthelot<sup>12</sup> measured the heat of reaction of  $\text{MgSO}_4 \text{ (aq.)}$  with  $\text{Na}_2\text{CO}_3 \text{ (aq.)}$ . Dissociation pressure data were obtained by Johnston,<sup>5</sup> Marcy and Kimek,<sup>1</sup> Brill,<sup>2</sup> Friedrich,<sup>1</sup> Hempel and Schubert,<sup>1</sup> Hedvall,<sup>1</sup> Grunberg,<sup>1</sup> Manchot and Lorenz,<sup>1</sup> and Centnerswer and Bruczs.<sup>2</sup> The calorimetric and the equilibrium data yield, for  $\text{MgCO}_3 \text{ (c)}$ ,  $Q_f = 268.1$  and  $265.1$ , respectively.

**MgCO<sub>3</sub> · nH<sub>2</sub>O (c).** We have estimated the value for the monohydrate. Takahashi and Nukada<sup>1</sup> reported  $Q^s = 4.26$  for the reaction,  $\text{MgCO}_3 \cdot \text{H}_2\text{O (c)} + 2 \text{H}_2\text{O (liq.)} = \text{MgCO}_3 \cdot 3 \text{H}_2\text{O (c)}$ .

**Mg(C<sub>2</sub>H<sub>3</sub>O<sub>3</sub>)<sub>2</sub> (aq.).** deForcrand<sup>3</sup> measured the heat of reaction of  $\text{MgSO}_4 \text{ (aq.)}$  with aqueous barium glycollate and aqueous lead glycollate to be 2.65 and 1.12, respectively.

**Mg(C<sub>2</sub>H<sub>3</sub>O<sub>3</sub>)<sub>2</sub> · nH<sub>2</sub>O (c).** deForcrand<sup>3</sup> measured the heats of solution of anhydrous magnesium glycollate and of the dihydrate.

**MgCl<sub>2</sub> · 6 CH<sub>3</sub>OH (c).** Lloyd, Brown, Bonnell, and Jones<sup>1</sup> reported dissociation pressure data on this alcoholate.

**Mg(NO<sub>3</sub>)<sub>2</sub> · 6 CH<sub>3</sub>OH (c).** Lloyd, Brown, Bonnell, and Jones<sup>1</sup> reported dissociation pressure data on this alcoholate.

**MgCN<sub>2</sub> (c).** Franc and Hockward<sup>1</sup> measured the heat of combustion of magnesium cyanamide.

**Mg(CN)<sub>2</sub> (aq.)**. Varet<sup>3</sup> measured the heat of reaction of MgSO<sub>4</sub> (aq.) with Ba(CN)<sub>2</sub> (aq.).

**MgSiO<sub>3</sub> (c)**. Tschernobaeff<sup>1</sup> reported the heat of reaction of MgCO<sub>3</sub> (c) with SiO<sub>2</sub> (c). See also Marchal<sup>1</sup> and White.<sup>1</sup>

**MgZn<sub>2</sub> (c)**. Roos<sup>2</sup> measured the heat of solution of this alloy in bromine water to be 322.1; Biltz and Hohorst<sup>1</sup> found the value 167.6 in HCl(8). See also von Wartenberg.<sup>8</sup>

**Mg<sub>2</sub>Sn (c)**. For the heat of solution of this alloy, Biltz and Holverscheid<sup>1</sup> reported 261 in (FeCl<sub>3</sub>+HCl) (aq.). This value was later corrected to 251 by Biltz and Meyer.<sup>2</sup>

**MgCd (c, II)**. For the heat of solution of this alloy, Roos<sup>2</sup> found 223.5 in bromine water; Biltz and Hohorst<sup>1</sup> found 123.7 in HCl (8).

**MgCd (c, I)**. Roos<sup>2</sup> reported a value for the heat of transition at 243°.

**MgHg<sub>4</sub> (c)**. Tammann and Ohler<sup>1</sup> measured the heat of solution of this alloy in HCl (9.3) to be 95.8.

**Mg<sub>4</sub>Al<sub>3</sub> (c)**. For the heat of solution of this alloy, Roos<sup>2</sup> found 111.7 in bromine water; Biltz and Hohorst<sup>1</sup> 779 in HCl (8).

**Mg<sub>n</sub>Ce (c)**. Biltz and Pieper<sup>1</sup> reported the following heats of solution in HCl (20): MgCe (c), 260.5; Mg<sub>3</sub>Ce (c), 477.3. See also Muthmann and Beck.<sup>1</sup>

**MgBr<sub>2</sub> · nHgBr<sub>2</sub> (aq.)**. Varet<sup>2, 6</sup> measured the heats of mixing MgBr<sub>2</sub> (aq.) with  $\frac{1}{2}$ , 1, and 2 moles of HgBr<sub>2</sub> (aq.).

**Mg(CN)<sub>2</sub> · nHg(CN)<sub>2</sub> (aq.)**. Varet<sup>2, 6</sup> measured the heats of mixing Mg(CN)<sub>2</sub> (aq.) with 1 and 2 moles of Hg(CN)<sub>2</sub> (aq.).

**HgX<sub>2</sub> · 2Hg(CN)<sub>2</sub> (aq.)**. Varet<sup>2, 6</sup> measured the heats of mixing 2Hg(CN)<sub>2</sub> (aq.) with HgCl<sub>2</sub> (aq.), HgBr<sub>2</sub> (aq.), and HgI<sub>2</sub> (aq.), respectively.

**HgX<sub>2</sub> · 2Hg(CN)<sub>2</sub> · nH<sub>2</sub>O (c)**. Varet<sup>2, 6</sup> measured the heats of solution of the chloride hexahydrate and the bromide and iodide octahydrates.

**MgWO<sub>4</sub> (c)**. Tammann and Westerholt<sup>1</sup> reported  $Q=3.4$  for the reaction of MgO (c) with WO<sub>3</sub> (c).

**MgMoO<sub>4</sub> (c)**. Tammann and Westerholt<sup>1</sup> reported  $Q=7.3$  for the reaction of MgO (c) with MoO<sub>3</sub> (c).

**6MgO · 8B<sub>2</sub>O<sub>3</sub> · MgCl<sub>2</sub> (c)**. For the heat of transition of boracite at 265°, Kroker<sup>1</sup> found -0.84, Mallard and LeChatelier<sup>1</sup> found -1.8.

## CALCIUM

**Ca (c, II)**. Standard state.

**Ca (c, I)**. Eastman, Williams, and Young<sup>1</sup> and Zalesenski and Zulenski<sup>1</sup> reported values for the transition at 400°.

**Ca (liq.)**. Data on the heat of fusion of calcium were reported by Randall and Tamale,<sup>1</sup> Moldenhauer and Roll-Hansen,<sup>1</sup> Bronsted,<sup>2</sup> and Zalesenski and Zulenski.<sup>1</sup>

**Ca (g).** Vapor pressure data on solid and liquid calcium were reported by Pilling,<sup>1</sup> Ruff and Hartman,<sup>1</sup> and Hartman and Schneider.<sup>1</sup> See also Randall and Tamale.<sup>1</sup> The values for the energy states of gaseous monatomic calcium are from Fowler<sup>1</sup> and Bowen.<sup>5</sup>

**CaCl<sub>2</sub> (aq.).** The data on the heat of solution of calcium in aqueous hydrochloric acid are: Guntz and Benoit,<sup>1,2</sup> 129.8 in HCl(120) at 16°; Guntz and Bassett,<sup>1,2</sup> 129.0 in HCl(120) at 9°; Biltz and Hohorst,<sup>1</sup> 130.1 in HCl(8). See also Thomsen,<sup>15</sup> Moissan,<sup>1,2</sup> Bronsted,<sup>2</sup> and Copeaux and Phillips.<sup>1</sup> Data on the heat of dilution of aqueous CaCl<sub>2</sub> were reported by Thomsen,<sup>15</sup> Tucker,<sup>1</sup> Dunnington and Hoggard,<sup>1</sup> Lehtonen,<sup>1</sup> Nernst and Orthmann,<sup>2</sup> Richards and Dole,<sup>1</sup> and Lange and Streeck.<sup>1</sup>

**Ca<sup>++</sup> (∞).** This value is obtained from those for CaCl<sub>2</sub> (∞) and Cl<sup>-</sup> (∞).

**CaO (c).** The data on the heat of solution of calcium oxide in aqueous hydrochloric acid are: Bäckstrom,<sup>1</sup> 46.17 in HCl(55) at 25°; Berthelot,<sup>22</sup> 46.1 in HCl(330) at 16°; Matignon,<sup>4</sup> 47.0 in HCl(110); Thorvaldson, Brown, and Peaker,<sup>1</sup> 46.46 in HCl(200) at 20°; Copeaux and Phillips,<sup>1</sup> 46.1 in HCl(25); Thomsen,<sup>15</sup> 46.03 in HCl(200). Gautier's<sup>1</sup> values for the fused oxide and the oxide prepared at 1000°, 1200°, and 2000° are 46.54, 46.47, 46.40, and 46.51, respectively, in HCl(110).

**CaO (g).** Vapor pressure data were reported by Ruff and Schmidt<sup>1</sup> and Claasen and Veenemans.<sup>1</sup>

**CaO (liq.).** Washburn<sup>1</sup> reported the heat of fusion.

**Ca(OH)<sub>2</sub> (aq.).** Moissan<sup>1,2</sup> and Guntz and Bassett<sup>2</sup> measured the heat of solution of calcium in water. The heat of neutralization of Ca(OH)<sub>2</sub> (aq.) with 2HCl (aq.) was measured by Thomsen,<sup>15</sup> Berthelot,<sup>22</sup> de Forcrand,<sup>29</sup> and Hess.<sup>5</sup>

**Ca(OH)<sub>2</sub> (c).** For the heat of solution of Ca(OH)<sub>2</sub> (c), Thomsen<sup>15</sup> found 30.49 in HCl(200), and Thorvaldson and Brown<sup>1</sup> found 30.82 in HCl(200) at 20°. See also Berthelot.<sup>22</sup> Direct measurements of the heat of the reaction, CaO (c) + H<sub>2</sub>O (liq.) = Ca(OH)<sub>2</sub> (c), were made by Mannheimer,<sup>1</sup> Kohnert,<sup>1</sup> and Kohlschutter and Feilknecht,<sup>1</sup> who reported  $Q = 15.30, 15.18, \text{ and } 15.30$ , respectively.

**CaO<sub>2</sub> (c).** Bergius,<sup>1</sup> from equilibrium studies, reported  $Q = -5.4$  for the reaction, CaO<sub>2</sub> (c) = CaO (c) +  $\frac{1}{2}$  O<sub>2</sub> (g). de Forcrand<sup>29, 30</sup> measured the heat of solution of CaO<sub>2</sub> (c) in HCl(100) to be 18.93.

**CaO<sub>2</sub> · 8H<sub>2</sub>O (c).** de Forcrand<sup>29, 30</sup> reported  $Q = 15.6$  for the reaction, CaO<sub>2</sub> (c) + 8H<sub>2</sub>O (liq.) = CaO<sub>2</sub> · 8H<sub>2</sub>O (c).

**CaH<sub>2</sub> (c).** Guntz and Bassett<sup>1</sup> and Bronsted<sup>2</sup> measured the heat of solution of solid calcium hydride in aqueous HCl. Equilibrium data on the reaction, CaH<sub>2</sub> (c) = Ca (c) + H<sub>2</sub> (g), were obtained by Brönsted<sup>2</sup> and Moldenhausser and Roll-Hansen,<sup>1</sup> and were reviewed by Lewis and Randall.<sup>5</sup> See also Kassarnowsky.<sup>2</sup>

**CaH (g).** Watson<sup>2</sup> reported, from spectroscopic data, the energy of dissociation into gaseous atoms. See also Hulthen.<sup>1</sup>

$\text{Ca}(\text{OH})_2 \cdot \text{H}_2\text{O}_2$  (c). de Forcrand<sup>29, 30</sup> measured the heat of reaction of  $\text{Ca}(\text{OH})_2$  (aq.) with  $\text{H}_2\text{O}_2$  (aq.) to be 6.85.

$\text{CaF}_2$  (c). Guntz<sup>1</sup> measured the heat of reaction of  $\text{Ca}(\text{OH})_2$  (aq.) with  $2\text{HF}$  (aq.) to form  $\text{CaF}_2$  (c) and  $2\text{H}_2\text{O}$  (liq.).

$\text{CaF}_2$  ( $\infty$ ). This value is obtained from those for the aqueous ions.

$\text{CaF}$  (g). Johnson<sup>3</sup> reported the energy of dissociation into gaseous atoms.

$\text{CaCl}$  (c). Benoit<sup>2</sup> reported the value 72.2 for the heat of solution of  $\text{CaCl}$  (c) in aqueous  $\text{HCl}$ ; which yields  $Q_f = 96.9$ . Since the mixture  $\frac{1}{2} \text{CaCl}_2$  (c) +  $\frac{1}{2} \text{Ca}$  (c) would have a heat of formation of 95.3, the existence of the subchloride,  $\text{CaCl}$  (c), appears doubtful.

$\text{CaCl}_2$  (c). The data on the heat of solution are: Thomsen,<sup>15</sup> 17.41<sub>200</sub>; Person,<sup>6</sup> 19.4; Ditte,<sup>10</sup> 15.0; Baud,<sup>1</sup> 18.17<sub>400</sub><sup>16</sup>; Pickering,<sup>8</sup> 18.73<sub>400</sub>; Berthelot and Ilosvay,<sup>1</sup> 17.6<sub>100</sub><sup>12</sup>; Lehtonen,<sup>1</sup> 16.05<sub>200</sub><sup>0</sup>; de Forcrand,<sup>57</sup> 17.47<sup>15</sup>. See also Cambi and Devoto,<sup>1</sup> Lorenz and Winzer,<sup>1</sup> Jones and Taylor,<sup>1</sup> Fajans,<sup>3</sup> and Favre and Silbermann.<sup>3</sup>

$\text{CaCl}_2 \cdot \text{H}_2\text{O}$  (c). The data on the heat of solution are: Thomsen,<sup>15</sup> 12.1<sub>100</sub>; Sabatier,<sup>2</sup> 11.7<sub>300</sub><sup>21</sup>.

$\text{CaCl}_2 \cdot 2\text{H}_2\text{O}$  (c). Thomsen<sup>15</sup> measured the heat of solution.

$\text{CaCl}_2 \cdot 4\text{H}_2\text{O}$  (c). Thomsen<sup>15</sup> measured the heat of solution.

$\text{CaCl}_2 \cdot 6\text{H}_2\text{O}$  (c). The data on the heat of solution are: Thomsen,<sup>15</sup> -4.36<sub>400</sub>; Pickering,<sup>8</sup> -4.25<sub>400</sub>; Ditte,<sup>10</sup> -4.5<sup>12</sup>; van Deventer and van der Stadt,<sup>1</sup> -4.56. See also van't Hoff, Kenrick, and Dawson.<sup>1</sup>

$\text{CaCl}_2 \cdot 6\text{H}_2\text{O}$  (liq.). Morgan and Benson<sup>1</sup> reported the heat of fusion of the hexahydrate to be 8.93.

$\text{CaCl}_2 \cdot 2\text{CaO}$  (c). Andre<sup>1, 2</sup> measured the heat of solution in  $\text{HCl}$  (aq.).

$\text{CaCl}_2 \cdot 3\text{CaO} \cdot n\text{H}_2\text{O}$  (c). Andre<sup>1, 2</sup> measured the heats of solution of the anhydrous basic chloride and of the tri- and hexadecahydrates in  $\text{HCl}$  (aq.). See also Tassilly.<sup>1</sup>

$\text{Ca}(\text{ClO})_2$  (aq.). Neumann and Muller<sup>1</sup> measured the heat of reaction of  $\text{Ca}(\text{OH})_2$  (aq.) with  $\text{HClO}$  (aq.) and with  $\text{Cl}_2$  (g).

$\text{CaOCl}_2$  (aq.). Ochi<sup>2, 3, 4</sup> measured the heat of the reaction of  $\text{CaOCl}_2$  (aq.) with  $\text{H}_2\text{O}_2$  (aq.).

$\text{CaOCl}_2$  (c). Ochi<sup>2, 3, 4</sup> measured the heat of solution. Neumann and Muller,<sup>1</sup> Hurter,<sup>1</sup> and Nydegger<sup>1</sup> measured the heat of reaction of  $\text{CaO}$  (c) with  $\text{Cl}_2$  (g).

$\text{CaOCl}_2 \cdot \text{H}_2\text{O}$  (c). Ochi<sup>2, 3, 4</sup> measured the heat of solution.

$\text{CaBr}_2$  (aq.). The value for  $\text{CaBr}_2$  ( $\infty$ ) is obtained from those for  $\text{Ca}^{++}(\infty)$  and  $\text{Br}^-(\infty)$ . Data on the heat of dilution were reported by Lange and Streeck.<sup>1</sup>

$\text{CaBr}_2$  (c). The data on the heat of solution are: Thomsen,<sup>15</sup> 24.5<sub>400</sub>; Varet,<sup>2</sup> 26.4<sub>400</sub><sup>15</sup>; Pickering,<sup>8</sup> 23.3<sub>800</sub>. See also Cambi and Devoto.<sup>1</sup>

$\text{CaBr}_2 \cdot 6\text{H}_2\text{O}$  (c). Thomsen<sup>15</sup> measured the heat of solution.

$\text{CaBr}_2 \cdot 3\text{CaO} \cdot n\text{H}_2\text{O}$  (c). Tassilly<sup>1, 2</sup> measured the heats of solution of the tri- and hexadecahydrates in aqueous  $\text{HBr}$ .

**CaI<sub>2</sub> (aq.).** The value for CaI<sub>2</sub> (∞) is obtained from those for Ca<sup>++</sup>(∞) and I<sup>-</sup>(∞). We have estimated the heat of dilution.

**CaI<sub>2</sub> (c).** The data on the heat of solution are: Thomsen,<sup>15</sup> 27.70<sub>400</sub>; de Forcrand,<sup>57</sup> 28.1<sub>200</sub><sup>15</sup>; Varet,<sup>2</sup> 27.6; Pickering,<sup>8</sup> 26.9<sub>800</sub>.

**CaI<sub>2</sub> · 8H<sub>2</sub>O (c).** Tassilly<sup>1, 4</sup> measured the heat of solution.

**CaI<sub>2</sub> · 3CaO · 16H<sub>2</sub>O (c).** Tassilly<sup>1</sup> measured the heat of solution.

**CaS (aq.).** This value is obtained from those for the ions.

**CaS (c).** Sabatier<sup>1</sup> measured the heat of solution in aqueous HCl. See also Taylor<sup>1</sup> and Sherman.<sup>1</sup>

**CaSO<sub>3</sub> · 2H<sub>2</sub>O (c).** Bichowsky<sup>4</sup> reported  $Q=6.3$  for the reaction, CaS<sub>2</sub>O<sub>3</sub> (aq.) + 2H<sub>2</sub>O (liq.) = CaSO<sub>3</sub> · 2H<sub>2</sub>O (c) + S (c).

**CaS<sub>2</sub>O<sub>3</sub> (aq.).** The value for CaS<sub>2</sub>O<sub>3</sub>(800) is obtained from those for the ions. Data on the heat of dilution were reported by Bichowsky.<sup>4</sup>

**CaSO<sub>4</sub> (aq.).** The value for CaSO<sub>4</sub> (∞) is obtained from those for Ca<sup>++</sup>(∞) and SO<sub>4</sub><sup>--</sup>(∞). Thomsen<sup>15</sup> measured the heat of neutralization of H<sub>2</sub>SO<sub>4</sub> (aq.) with Ca(OH)<sub>2</sub> (aq.). See also Hess.<sup>5</sup> Data on the heat of dilution were reported by Lange and Messner<sup>2</sup> and Lange and Streeck.<sup>2</sup>

**CaSO<sub>4</sub> · nH<sub>2</sub>O (c).** For the heat of solution of the dihydrate Thomsen<sup>15</sup> and Lange and Dürr<sup>1</sup> found -0.30 and -0.84<sub>4000</sub>, respectively. Values for the heats of hydration of CaSO<sub>4</sub> (c, anhydrite), CaSO<sub>4</sub> (c, "soluble"), and the hemihydrate to the dihydrate were reported by Thomsen,<sup>15</sup> van't Hoff, Armstrong, Henrickson, Weigert, and Just,<sup>1</sup> Chassevent,<sup>1</sup> Mixter,<sup>17</sup> and de Forcrand.<sup>14</sup>

**CaSe (c).** Fabre<sup>1</sup> measured the heat of solution in aqueous HCl.

**CaN<sub>6</sub> (c).** Wohler and Martin<sup>1</sup> measured the heat of decomposition of calcium azide.

**Ca<sub>3</sub>N<sub>2</sub> (c).** For the heat of solution of calcium nitride, Moser and Herzner<sup>1</sup> reported 261.6 and Guntz and Bassett<sup>1, 2</sup> reported 342.7. From measurement of the direct formation, Franck and Bodea<sup>1</sup> reported  $Q_f = 102.6$ .

**CaN<sub>2</sub>O<sub>2</sub> · 4H<sub>2</sub>O (c).** Berthelot<sup>107</sup> measured the heat of reaction of this tetrahydrate with aqueous (Br<sub>2</sub> + KBr).

**Ca(NO<sub>3</sub>)<sub>2</sub> (aq.).** The value for Ca(NO<sub>3</sub>)<sub>2</sub> (∞) is obtained from those for Ca<sup>++</sup>(∞) and NO<sub>3</sub><sup>-</sup>(∞). Data on the heat of dilution were reported by Partington and Soper,<sup>1</sup> Nernst and Orthmann,<sup>2</sup> Rümelin,<sup>1</sup> Lange and Messner,<sup>2</sup> and Lange and Streeck.<sup>2</sup>

**Ca(NO<sub>3</sub>)<sub>2</sub> (c).** The data on the heat of solution yield the following values for  $S_{400}$ : Thomsen,<sup>15</sup> 3.94; Pickering,<sup>8</sup> 3.94; Berthelot,<sup>131</sup> 3.2; Ewing, Rogers, Miller, and McGovern,<sup>1</sup> 3.96; Partington and Soper,<sup>1</sup> 3.92.

**Ca(NO<sub>3</sub>)<sub>2</sub> · nH<sub>2</sub>O (c).** The data on the heat of solution of the tetrahydrate yield the following values for  $S_{400}$ : Thomsen,<sup>15</sup> -7.25; Pickering,<sup>8</sup> -8.35; Ewing, Rogers, Miller, and McGovern,<sup>1</sup> -8.13; Berthelot,<sup>131</sup> -7.6. The data of Ewing, Rogers, Miller, and McGovern<sup>1</sup> yield the following values for  $S_{400}$ : trihydrate, -4.32; dihydrate, -3.35. Dissociation pressure data were reported by Lescoeur,<sup>4</sup> Ewing,<sup>1</sup> and Biltz.<sup>8</sup>

$\text{Ca}(\text{NO}_3)_2 \cdot 4\text{H}_2\text{O}$  (liq.). Data on the heat of fusion of the tetrahydrate were reported by Pickering<sup>8</sup> and Morgan and Owen.<sup>1</sup>

$\text{Ca}(\text{NO}_3)_2(\text{C}_2\text{H}_5\text{OH})$ . For the heat of solution of calcium nitrate in ethyl alcohol, Partington and Soper found 7.41<sub>200</sub>  $\text{C}_2\text{H}_5\text{OH}$ <sup>25</sup>. See also Pickering.<sup>8</sup>

$\text{Ca}(\text{NH}_2)_2$  (c). Guntz and Benoit<sup>1</sup> measured the heat of solution of calcium amide in aqueous HCl.

$\text{Ca}(\text{NO}_3)_2 \cdot \text{Ca}(\text{OH})_2 \cdot n\text{H}_2\text{O}$  (c). Werner<sup>1</sup> measured the heat of solution in aqueous  $\text{HNO}_3$  of the anhydrous compound and of the hydrate with  $2\frac{1}{2} \text{H}_2\text{O}$ .

$\text{CaX}_2 \cdot n\text{NH}_3$  (c). Hüttig<sup>1</sup> and Biltz, Klatte, and Rahlfs<sup>1</sup> reported values for the heats of dissociation of the mono-, di-, tetra-, and octammines of  $\text{CaCl}_2$  and the mono-, di-, hexa-, and octammines of  $\text{CaBr}_2$  and  $\text{CaI}_2$ ; Ephraim<sup>9</sup> for the octammine of  $\text{CaCl}_2$ ; Bonnefoi<sup>1</sup> for the di- and octammines of  $\text{CaCl}_2$  and the hexammine of  $\text{CaI}_2$ ; Isambert<sup>2, 5</sup> for the di-, tetra-, and octammines of  $\text{CaCl}_2$ . See also Isambert<sup>13</sup> and Antoine.<sup>3</sup>

$\text{CaSO}_4 \cdot (\text{NH}_4)_2\text{SO}_4 \cdot \text{H}_2\text{O}$  (c). Barre<sup>1</sup> measured the heat of solution.

$2\text{CaSO}_4 \cdot (\text{NH}_4)_2\text{SO}_4$  (c). Barre<sup>1</sup> measured the heat of solution.

$5\text{CaSO}_4 \cdot (\text{NH}_4)_2\text{SO}_4 \cdot \text{H}_2\text{O}$  (c). Barre<sup>1</sup> measured the heat of solution.

$\text{Ca}_3(\text{PO}_4)_2$  (colloidal). Berthelot<sup>52, 54</sup> measured the heat of reaction of  $\text{H}_3\text{PO}_4$  (aq.) with  $1\frac{1}{2} \text{Ca}(\text{OH})_2$  (aq.) to be 29.2.

$\text{Ca}_3(\text{PO}_4)_2$  (c). Berthelot<sup>52, 54</sup> measured the heat of reaction of  $1\frac{1}{2} \text{CaCl}_2$  (aq.) with  $\text{Na}_3\text{PO}_4$  (aq.).

$\text{CaHPO}_4$  (aq.). Berthelot<sup>52, 54</sup> measured the heat of reaction of  $\text{H}_3\text{PO}_4$  (aq.) with  $\text{Ca}(\text{OH})_2$  (aq.) to be 24.5.

$\text{Ca}(\text{H}_2\text{PO}_4)_2$  (aq.). Berthelot<sup>52, 54</sup> measured the heat of reaction of  $\text{H}_3\text{PO}_4$  (aq.) with  $\frac{1}{2} \text{Ca}(\text{OH})_2$  (aq.) to be 14.8.

$\text{CaHPO}_4 \cdot 2\text{H}_2\text{O}$  (c). Joly<sup>3, 4</sup> reported  $Q=2.9$  for the reaction,  $\text{Na}_2\text{HPO}_4$  (aq.) +  $2\text{H}_2\text{O}$  (liq.) +  $\text{CaCl}_2$  (aq.) =  $\text{CaHPO}_4 \cdot 2\text{H}_2\text{O}$  (c) +  $2\text{NaCl}$  (aq.).

$\text{Ca}(\text{H}_2\text{PO}_4)_2 \cdot \text{H}_2\text{O}$  (c). We have estimated this value.

$\text{Ca}(\text{H}_2\text{PO}_4)_2 \cdot \text{H}_2\text{O} \cdot n\text{NH}_3$  (c). Stollenwerk<sup>1</sup> reported dissociation pressure data on the tetra-, di-, and monammines.

$\text{Ca}_3(\text{AsO}_4)_2$  (c, ppt.). Blarez<sup>1</sup> measured the heat of reaction of  $\text{H}_3\text{AsO}_4$  (aq.) with  $1\frac{1}{2} \text{Ca}(\text{OH})_2$  (aq.) to be 29.5.

$\text{CaHAsO}_4$  (aq.). Blarez<sup>1</sup> measured the heat of reaction of  $\text{H}_3\text{AsO}_4$  (aq.) with  $\text{Ca}(\text{OH})_2$  (aq.) to be 27.0.

$\text{Ca}(\text{H}_2\text{AsO}_4)_2$  (aq.). Blarez<sup>1</sup> measured the heat of reaction of  $\text{H}_3\text{AsO}_4$  (aq.) with  $\frac{1}{2} \text{Ca}(\text{OH})_2$  (aq.) to be 14.5.

$\text{CaC}_2$  (c). The data on the heat of solution of calcium carbide in dilute aqueous HCl are: de Forcrand,<sup>21</sup> 58.25<sup>13</sup>; Ruff and Josephy,<sup>1</sup> 60.8 in HCl(100). Guntz and Bassett<sup>1</sup> reported  $Q_f=13.1$ . Dissociation pressure data were reported by Ruff and Forster,<sup>1</sup> Krase and Yee,<sup>1</sup> and Franck and Hochwald.<sup>1</sup>

$\text{CaCO}_3$  (c, calcite). Thomsen<sup>15</sup> and Berthelot<sup>12</sup> measured the heat of

reaction of  $\text{CaCl}_2$  (aq.) with  $\text{Na}_2\text{CO}_3$  (aq.). Berthelot<sup>15</sup> measured the heat of solution of calcite in aqueous nitric acid. Bäckstrom<sup>1</sup> measured the heat of solution of calcite in  $\text{HCl}$  (50), saturated with  $\text{CO}_2$ , to be 3.24 at 25°. The heat of the direct reaction of lime with carbon dioxide was measured by Favre and Silbermann<sup>2</sup> and Dragert.<sup>1</sup> See also Franck and Hochwald<sup>1</sup> and Le Chatelier.<sup>7</sup> Dissociation pressure data were reported by Andrussow,<sup>2</sup> Smyth and Adams,<sup>1</sup> Lebeau,<sup>1</sup> Zavrieff,<sup>1</sup> Pott,<sup>1</sup> Reisenfeld,<sup>1</sup> Dutoit,<sup>1</sup> and Johnston.<sup>2, 5</sup> See also Bäckstrom.<sup>1</sup>

**$\text{CaCO}_3$  (c, aragonite).** For the heat of transition of aragonite to calcite the following values were reported: Favre and Silbermann,<sup>2</sup> 2.4; LeChatelier,<sup>7</sup> -0.3; Laschtschenko,<sup>5</sup> -2.7; Bäckstrom,<sup>4</sup> -0.33; Bäckstrom,<sup>5</sup> -0.04.

**$\text{Ca}(\text{HCO}_3)_2$  (aq.).** Randall and White<sup>3</sup> reviewed the data of Bäckstrom,<sup>3</sup> Cameron and Brezeate,<sup>1</sup> Cameron and Robinson,<sup>1, 2</sup> Cavazzi,<sup>1</sup> Ehlert and Hempel,<sup>1</sup> Engel,<sup>1</sup> Haehnel,<sup>1, 2</sup> Johnston,<sup>3</sup> Kendall,<sup>2</sup> McCoy and Smith,<sup>1</sup> Schloesing,<sup>1</sup> Wells,<sup>1</sup> and Frear, Johnston, and Kline,<sup>1</sup> on the solubility of calcium carbonate in aqueous carbonic acid, and concluded that  $Q^{25} = 8.6$  for the reaction,  $\text{CaCO}_3$  (c, calcite) +  $\text{CO}_2$  (g) +  $\text{H}_2\text{O}$  (liq.) =  $\text{Ca}(\text{HCO}_3)_2$  (aq.).

**$\text{CaC}_2\text{O}_4$  (c).** Berthelot<sup>12</sup> found  $Q = 8.1^{15}$  for the reaction,  $\text{K}_2\text{C}_2\text{O}_4$  (200) +  $\text{CaCl}_2$  (200) =  $\text{CaC}_2\text{O}_4$  (c) +  $2\text{KCl}$  (200).

**$\text{Ca}(\text{CHO}_2)_2$  (aq.).** Berthelot<sup>9, 131</sup> measured the heat of neutralization of aqueous formic acid with aqueous calcium hydroxide.

**$\text{Ca}(\text{CHO}_2)_2$  (c).** Berthelot<sup>9, 131</sup> measured the heat of solution of calcium formate.

**$\text{Ca}(\text{C}_2\text{H}_3\text{O}_2)_2$  (aq.).** The value for calcium acetate at infinite dilution has been obtained from those for the aqueous ions. Berthelot<sup>9</sup> measured the heat of neutralization of aqueous acetic acid with aqueous calcium hydroxide.

**$\text{Ca}(\text{C}_2\text{H}_3\text{O}_2)_2$  (c).** Berthelot<sup>9</sup> and Favre and Silbermann<sup>3</sup> measured the heat of solution.

**$\text{Ca}(\text{C}_2\text{H}_3\text{O}_2)_2 \cdot \text{H}_2\text{O}$  (c).** Berthelot<sup>9</sup> measured the heat of solution.

**$\text{Ca}(\text{C}_2\text{H}_3\text{O}_3)_2$  (aq.).** This value is obtained from those for the aqueous calcium and glycolate ions.

**$\text{Ca}(\text{C}_2\text{H}_3\text{O}_3)_2 \cdot n\text{H}_2\text{O}$  (c).** de Forcrand<sup>3</sup> measured the heats of solution of the anhydrous salt and the tri- and pentahydrates.

**$\text{Ca}(\text{C}_2\text{H}_5\text{O})_2$  (c).** de Forcrand<sup>13, 22</sup> measured the heat of solution in  $\text{HCl}$  (110).

**$\text{Ca}(\text{C}_2\text{H}_5\text{O})_2 \cdot 2\text{C}_2\text{H}_5\text{OH}$  (c).** de Forcrand<sup>13, 22</sup> measured the heat of solution in  $\text{HCl}$  (110).

**$3\text{CaO} \cdot 4\text{C}_2\text{H}_5\text{OH}$  (c).** de Forcrand<sup>13, 22</sup> measured the heat of solution in aqueous  $\text{HCl}$ .

**$\text{CaX}_2 \cdot n\text{C}_2\text{H}_5\text{OH}$  (c).** Bonnell and Jones<sup>1</sup> reported dissociation pressure data on the tri- and tetra-alcoholates of  $\text{CaCl}_2$  and  $\text{CaBr}_2$ .

**$\text{CaCl}_2 \cdot (\text{CH}_3)_2\text{CO}$  (c).** Bagster<sup>1</sup> obtained dissociation pressure data on this compound.

$\text{Ca}(\text{NO}_3)_2 \cdot 2\text{CH}_3\text{OH}$  (c). Lloyd, Brown, Bonnell, and Jones<sup>1</sup> reported dissociation pressure data on this compound.

$\text{Ca}(\text{CN})_2$  (aq.). Joannis<sup>1</sup> measured the heat of neutralization of aqueous calcium hydroxide with aqueous HCN.

$3\text{CaO} \cdot \text{Ca}(\text{CN})_2 \cdot 15\text{H}_2\text{O}$  (c). Joannis<sup>1</sup> measured the heat of solution in aqueous HCl.

$\text{CaCN}_2$  (c). Franck and Hochwald<sup>1</sup> and Krase and Yee<sup>1</sup> measured the heat of the reaction,  $\text{CaC}_2$  (c) +  $\text{N}_2$  (g) =  $\text{CaCN}_2$  (c) + C (c), to be 72 and 98, respectively; whence, for  $\text{CaCN}_2$  (c),  $Q_f = 86.5$  and 112.5. The equilibrium data of Franck and Heimann<sup>1</sup> on the same reaction yield, for  $\text{CaCN}_2$  (c),  $Q_f = 85.9$ . See also Thompson and Lombard<sup>2</sup> and Dotch.<sup>1</sup> The average of the data of Franck and Hochwald,<sup>1</sup> Kameyama and Oka,<sup>2</sup> and Kameyama<sup>1</sup> on the heat of combustion of  $\text{CaCN}_2$  (c) yield, for the latter,  $Q_f = 84.5$ . The data of Krase and Yee<sup>1</sup> on the reaction,  $\text{Ca}_3\text{N}_2$  (c) +  $3\text{C}$  (c) +  $2\text{N}_2$  (g) =  $3\text{CaCN}_2$  (c), yield, for  $\text{CaCN}_2$  (c),  $Q_f = 102$ . See also Cochet,<sup>1</sup> Badger,<sup>1</sup> LeBlanc and Eschmann,<sup>1</sup> Matignon,<sup>9</sup> and Landis.<sup>1</sup>

$\text{CaSi}_n$  (c). Wohler and Martin<sup>1</sup> measured the heats of combustion of  $\text{CaSi}$  (c) and  $\text{CaSi}_2$  (c) to form  $\text{CaSiO}_3$  (c) and  $\text{CaSiO}_3$  (c) +  $\text{SiO}_2$  (c), respectively.

$\text{CaSiO}_3$  (c). Tschernobaeff<sup>1</sup> and Tschernobaeff and Wologdine<sup>1</sup> reported  $Q = -25.3$  for the reaction,  $\text{CaCO}_3$  (c) +  $\text{SiO}_2$  (c) =  $\text{CaSiO}_3$  (c) +  $\text{CO}_2$  (g); whence, for  $\text{CaSiO}_3$  (c),  $Q_f = 373.1$ . For the same reaction, LeChatelier<sup>8, 10</sup> reported  $Q = -13.4$ ; whence, for  $\text{CaSiO}_3$  (c),  $Q_f = 385$ . For the heat of solution of  $\text{CaSiO}_3$  (c) in HCl (24.65) at 50°, Roth and Chall<sup>1</sup> found  $Q = 23.04$ , and for the reaction,  $\text{CaO}$  (c) +  $\text{SiO}_2$  (c,  $\alpha$  quartz) =  $\text{CaSiO}_3$  (c), reported  $Q^{50} = 19.66$ ; whence, for  $\text{CaSiO}_3$  (c),  $Q_f = 374.7$ . The equilibrium data of Marchal<sup>6</sup> on the reaction,  $\text{CaSO}_4$  (c) +  $\text{SiO}_2$  (c) =  $\text{CaSiO}_3$  (c) +  $\text{SO}_3$  (g), yield  $Q = -81.2$ ; whence, for  $\text{CaSiO}_3$  (c),  $Q_f = 369$ . Wagner's<sup>1</sup> data on the heats of solution, in HCl (25), of the two forms of  $\text{CaSiO}_3$  (c), wollastonite and pseudowollastonite,  $Q = 20.01$  and 21.27, respectively, yield for the latter,  $Q_f = 376.6$ , and for the transition of the former into the latter,  $T = -1.26$ . See Allen, White, and Wright.<sup>1</sup>

$\text{Ca}_2\text{SiO}_4$  (c). Tschernobaeff<sup>1</sup> and Tschernobaeff and Wologdine<sup>1</sup> reported  $Q = -56.7$  for the reaction,  $2\text{CaCO}_3$  (c) +  $\text{SiO}_2$  (c) =  $\text{Ca}_2\text{SiO}_4$  (glass) +  $2\text{CO}_2$  (g), whence, for  $\text{Ca}_2\text{SiO}_4$  (c),  $Q_f = 536.7$ .

$\text{CaSn}_3$  (c). Biltz and Meyer<sup>1</sup> measured the heat of solution of this alloy in aqueous ( $\text{FeCl}_3 + \text{HCl}$ ) to be 273. See also Biltz and Holverschait.<sup>1</sup>

$\text{CaI}_2 \cdot 2\text{PbI}_2 \cdot n\text{H}_2\text{O}$  (c). Mosnier<sup>1</sup> measured the heats of solution of the anhydrous double salt and of the heptahydrate.

$\text{CaZn}_n$  (c). Roos<sup>2</sup> measured the heats of solution of  $\text{CaZn}_{10}$  (c) and  $\text{CaZn}_4$  (c) in bromine water to be 890.3 and 487.8, respectively. Biltz and Wagner<sup>1</sup> measured the heats of solution of  $\text{CaZn}_{10}$  (c),  $\text{CaZn}_4$  (c),  $\text{Ca}_2\text{Zn}_3$  (c), and  $\text{Ca}_4\text{Zn}$  (c) in HCl (20) to be 381.0, 219.5, 307.8, and 512.0, respectively.

$\text{CaCd}_3$  (c). Roos<sup>2</sup> measured the heat of solution of this alloy in  $\text{HCl}$ (8).

$\text{CaBr}_2 \cdot n\text{HgBr}_2$  (aq.). Varet<sup>2, 6</sup> measured the heats of mixing  $\text{CaBr}_2$  (aq.) with 1 and 2  $\text{HgBr}_2$  (aq.), respectively.

$\text{Ca}(\text{CN})_2 \cdot n\text{Hg}(\text{CN})_2$  (aq.). Varet<sup>2, 6</sup> measured the heats of mixing  $\text{Ca}(\text{CN})_2$  (aq.) with 1 and 2  $\text{Hg}(\text{CN})_2$  (aq.), respectively.

$\text{CaX}_2 \cdot 2\text{Hg}(\text{CN})_2$  (aq.). Varet<sup>2, 6</sup> measured the heats of mixing 2  $\text{Hg}(\text{CN})_2$  (aq.) with  $\text{CaCl}_2$  (aq.),  $\text{CaBr}_2$  (aq.), and  $\text{CaI}_2$  (aq.), respectively.

$\text{CaX}_2 \cdot 2\text{Hg}(\text{CN})_2 \cdot n\text{H}_2\text{O}$  (c). Varet<sup>2, 6</sup> measured the heats of solution of the chloride hexahydrate, the bromide heptahydrate, and the iodide hexahydrate.

$\text{Ca}(\text{CN})_2 \cdot n\text{AgCN}$  (aq.). Varet<sup>5</sup> measured the heats of mixing  $\text{Ca}(\text{CN})_2$  (aq.) with 1 and 2  $\text{AgCN}$  (c), respectively.

$\text{CaO} \cdot \text{Fe}_2\text{O}_3$  (c). The equilibrium data of Marchal<sup>6</sup> yield  $Q = -46$  for the reaction,  $\text{Fe}_2\text{O}_3$  (c) +  $\text{CaSO}_4$  (c) =  $\text{CaO} \cdot \text{Fe}_2\text{O}_3$  (c) +  $\text{SO}_3$  (g); whence, for  $\text{CaO} \cdot \text{Fe}_2\text{O}_3$  (c),  $Q_f = 399$ .

$\text{Ca}_2\text{Fe}(\text{CN})_6$  (aq.). Joannis<sup>1</sup> measured the heat of reaction of  $\text{H}_4\text{Fe}(\text{CN})_6$  (aq.) with 2  $\text{Ca}(\text{OH})_2$  (aq.) to be 56.4.

$\text{CaH}_2\text{Fe}(\text{CN})_6$  (aq.). Joannis<sup>1</sup> measured the heat of reaction of  $\text{H}_4\text{Fe}(\text{CN})_6$  (aq.) with  $\text{Ca}(\text{OH})_2$  (aq.) to be 28.4.

$\text{Ca}_2\text{Fe}(\text{CN})_6 \cdot 12\text{H}_2\text{O}$  (c). Joannis<sup>1</sup> measured the heat of solution.

$\text{CaWO}_4$  (c). Tammann and Westerholt<sup>1</sup> calculated  $Q = 39.8$  for the reaction,  $\text{CaO}$  (c) +  $\text{WO}_3$  (c) =  $\text{CaWO}_4$  (c).

$\text{CaO} \cdot n\text{B}_2\text{O}_3$  (c). Griveau<sup>1</sup> measured the heats of solution in aqueous  $\text{HCl}$  of these borates with  $n = \frac{1}{3}, \frac{1}{2}, 1$ , and 2.

$\text{CaAl}_3$  (c). Biltz and Wagner<sup>1</sup> measured the heat of solution of this alloy in  $\text{HCl}$ (8) to be 454.

$n\text{CaO} \cdot \text{Al}_2\text{O}_3$  (gls.). Tschernobaeff<sup>1</sup> reported  $Q = 44.7, 87.0$ , and 132.5 for the heats of the reactions of  $\text{Al}_2\text{O}_3$  (c) with 1, 2, and 3  $\text{CaCO}_3$  (c), respectively.

3  $\text{CaCl}_2 \cdot 4\text{AlCl}_3$  (c). Baud<sup>1</sup> measured the heat of solution.

3  $\text{CaO} \cdot \text{Al}_2\text{O}_3 \cdot 2\text{SiO}_2$  (c). Tschernobaeff and Wologdine<sup>1</sup> reported  $Q = 50.2$  for the reaction, 2  $\text{SiO}_2$  (c) +  $\text{Al}_2\text{O}_3$  (c) + 3  $\text{CaO}$  (c) = 3  $\text{CaO} \cdot \text{Al}_2\text{O}_3 \cdot 2\text{SiO}_2$  (c).

$\text{CaO} \cdot \text{Al}_2\text{O}_3 \cdot 6\text{SiO}_2$  (c, heulandite). Tschernobaeff and Wologdine<sup>1</sup> measured the heat of solution in aqueous (20%)  $\text{HF}$ .

$\text{Ca}_3\text{Mg}_4$  (c). Biltz and Hohorst<sup>1</sup> measured the heat of solution of this alloy in  $\text{HCl}$ (8). See also Roos.<sup>2</sup>

$\text{CaCl}_2 \cdot 2\text{MgCl}_2 \cdot 2\text{H}_2\text{O}$  (c). van't Hoff, Kenrick, and Dawson<sup>1</sup> measured the heat of solution.

$\text{CaCO}_3 \cdot \text{MgCO}_3$  (c). Mitchell<sup>1</sup> found the heat of solution of dolomite in aqueous  $\text{HCl}$  to be 31.6. Bäckstrom<sup>2</sup> calculated, from the equilibrium data of Marc and Limek,<sup>1</sup>  $Q = 1.8$  for the reaction,  $\text{CaCO}_3$  (c) +  $\text{MgCO}_3$  (c) =  $\text{CaCO}_3 \cdot \text{MgCO}_3$  (c).

## STRONTIUM

**Sr (c).** Standard state.

**Sr (g).** Vapor pressure data were reported by Ruff and Hartmann<sup>1</sup> and Hartmann and Schneider.<sup>1</sup> We have estimated the value for the heat of sublimation from the latter data. The values for the energy states of gaseous monatomic strontium are from Hansen and Thorsen,<sup>1</sup> Saunders,<sup>2</sup> Russell and Saunders,<sup>1</sup> and Fowler.<sup>1</sup>

**Sr (liq.).** We have estimated the heat of fusion of strontium.

**SrCl<sub>2</sub> (aq.).** The data of Guntz and Benoit<sup>2</sup> yield for the heat of the reaction,  $\text{Sr (c)} + 2 \text{HCl (140)} = \text{SrCl}_2 (280) + \text{H}_2 \text{ (g)}$ ,  $Q = 130.1$ ; whence, for  $\text{SrCl}_2 (200)$ ,  $Q_f = 209.0$ . Similar data on less pure samples of strontium were obtained by Thomsen<sup>15</sup> and Guntz and Roderer.<sup>1</sup> Data on the heat of dilution of aqueous strontium chloride were reported by Stearn and Smith,<sup>1</sup> Lehtonen,<sup>1</sup> Pratt,<sup>1</sup> Magie,<sup>1</sup> Dunnington and Hoggard,<sup>1</sup> and Lange and Streeck.<sup>1</sup>

**Sr<sup>++</sup> (∞).** This value is obtained from those for  $\text{SrCl}_2 (\infty)$  and  $\text{Cl}^- (\infty)$ .

**SrCl<sub>2</sub> (c).** The data on the heat of solution are: Thomsen,<sup>15</sup> 11.15<sub>400</sub>; Berthelot,<sup>7</sup> 11.0; Berthelot and Ilosvay,<sup>1</sup> 11.1<sup>15</sup>; Baud,<sup>1</sup> 11.4<sub>440</sub><sup>21</sup>; Pickering,<sup>7</sup> 11.27<sub>200</sub>; Benoit,<sup>2</sup> 10.42<sub>HCl(aq.)</sub><sup>15</sup>; Maier<sup>2</sup> (see Hüttig and Slonim<sup>1</sup>), 11.44<sub>400</sub><sup>17</sup>. See also Cambi and Devoto.<sup>1</sup>

**SrO (c).** Thomsen<sup>15</sup> measured the heat of solution of strontium oxide in 2 HCl (200) to be 56.97; whence, for  $\text{SrO (c)}$ ,  $Q_f = 141.5$ . For the heat of solution of  $\text{SrO (c)}$  in water, Berthelot<sup>22</sup> reported 27.2 and de Forcrand<sup>48</sup> reported 29.7, 28.3, and 30.8. These values yield for  $\text{SrO (c)}$ ,  $Q_f = 143.6, 141.1, 142.5$ , and 140.0, respectively.

**SrO (g).** We have estimated the heat of sublimation from the vapor pressure data of Tiede and Birnbauer.<sup>1</sup>

**Sr(OH)<sub>2</sub> (aq.).** Thomsen,<sup>15</sup> de Forcrand,<sup>28</sup> and Berthelot<sup>22</sup> measured the heat of neutralization of 2 HCl (aq.) with  $\text{Sr(OH)}_2 \text{ (aq.)}$ .

**Sr(OH)<sub>2</sub> (c).** The data on the heat of solution of solid strontium hydroxide are: Thomsen,<sup>15</sup> 11.64<sub>400</sub>; Berthelot,<sup>9</sup> 9.6; Berthelot,<sup>22</sup> 37.68<sub>2HCl(330)</sub><sup>16</sup>; de Forcrand,<sup>51</sup> 10.33<sub>1100</sub><sup>15</sup>. See also Johnston,<sup>1, 4</sup> and Jorissen.<sup>1</sup>

**Sr(OH)<sub>2</sub> · H<sub>2</sub>O (c).** de Forcrand<sup>51</sup> measured the heat of solution.

**Sr(OH)<sub>2</sub> · 8 H<sub>2</sub>O (c).** The data on the heat of solution are: de Forcrand,<sup>51</sup> -14.27<sub>1100</sub><sup>15</sup>; Thomsen,<sup>15</sup> 12.99<sub>2HCl(200)</sub>; Berthelot,<sup>22</sup> 12.96<sub>2HCl(330)</sub><sup>16</sup>. See also Muller and Erzbach<sup>1</sup> and Lescoeur.<sup>2</sup>

**SrO<sub>2</sub> (c).** de Forcrand<sup>28</sup> measured the heat of solution in aqueous HCl.

**SrO<sub>2</sub> · 9 H<sub>2</sub>O (c).** de Forcrand<sup>28</sup> measured the heat of solution in aqueous HCl.

**Sr<sub>2</sub>O (c).** Benoit<sup>2</sup> measured the heat of solution in aqueous HCl.

**SrH<sub>2</sub> (c).** Guntz and Benoit<sup>1</sup> measured the heat of solution in aqueous HCl. See also Kassarnowsky.<sup>2</sup>

**SrF<sub>2</sub> (c).** Petersen<sup>3</sup> measured the heat of reaction of 2 AgF (aq.) with SrCl<sub>2</sub> (aq.) to be 34.5. Guntz<sup>1</sup> measured the heat of neutralization of 2 HF (aq.) with Sr(OH)<sub>2</sub> (aq.) to be 17.9.

**SrF (g).** Johnson<sup>3</sup> estimated the energy of dissociation into gaseous atoms, from spectroscopic data.

**SrCl (c).** Benoit<sup>2</sup> reported the heat of solution in aqueous HCl for this supposed subchloride.

**SrCl<sub>2</sub> · H<sub>2</sub>O (c).** Maier<sup>2</sup> (see Hüttig and Slonim<sup>1</sup>) measured the heat of solution to be 6.02<sub>400</sub><sup>17</sup>; Thomsen<sup>15</sup> found 5.88<sub>400</sub>.

**SrCl<sub>2</sub> · 2 H<sub>2</sub>O (c).** The data on the heat of solution in 400H<sub>2</sub>O are: Maier<sup>2</sup> (see Hüttig and Slonim<sup>1</sup>), 2.57; Sabatier,<sup>2</sup> 2.07; Pickering,<sup>7</sup> 1.92; Thomsen,<sup>15</sup> 2.08.

**SrCl<sub>2</sub> · 6 H<sub>2</sub>O (c).** The data on the heat of solution yield the following values for *S*<sub>400</sub>: Thomsen,<sup>15</sup> -7.50; Berthelot,<sup>7</sup> -7.3; Maier<sup>2</sup> (see Hüttig and Slonim<sup>1</sup>), -7.44. See also Favre and Silbermann.<sup>3</sup> Dissociation pressure data on the hexahydrate were reported by Schumb,<sup>1</sup> Hüttig and Slonim,<sup>1</sup> Andreae,<sup>1</sup> Frowein,<sup>1</sup> Cohen,<sup>4</sup> Schottky,<sup>1</sup> Linebarger,<sup>1</sup> Lescoeur,<sup>2</sup> Schumb,<sup>1</sup> Baxter and Lansing,<sup>1</sup> Menzies,<sup>2</sup> and Biltz.<sup>8</sup>

**Sr(ClO)<sub>2</sub> (aq.).** Neumann and Muller<sup>2</sup> measured the heat of reaction of Sr(OH)<sub>2</sub> (aq.) with Cl<sub>2</sub> (g) and with 2 HClO (aq.).

**SrCl<sub>2</sub> · SrO · *n*H<sub>2</sub>O (c).** Andre<sup>1</sup> measured the heats of solution of the mono- and nonahydrates.

**SrBr<sub>2</sub> (aq.).** The value for SrBr<sub>2</sub> (∞) is obtained from those for the aqueous ions. Data on the heat of dilution were reported by Lange and Streeck.<sup>1</sup>

**SrBr<sub>2</sub> (c).** The data on the heat of solution are: Thomsen,<sup>15</sup> 16.1<sub>400</sub>; Tassilly,<sup>1</sup> 16.0<sub>20</sub>; Maier<sup>2</sup> (see Hüttig and Slonim<sup>1</sup>), 16.25.<sup>19</sup> See also Favre and Valson<sup>2</sup> and Cambi and Devoto.<sup>1</sup>

**SrBr<sub>2</sub> · H<sub>2</sub>O (c).** The data on the heat of solution yield the following values for *S*<sub>400</sub>: Thomsen,<sup>15</sup> 9.90; Maier<sup>2</sup> (see Hüttig and Slonim<sup>1</sup>), 8.86.

**SrBr<sub>2</sub> · 2 H<sub>2</sub>O (c).** Thomsen<sup>15</sup> measured the heat of solution.

**SrBr<sub>2</sub> · 4 H<sub>2</sub>O (c).** Thomsen<sup>15</sup> measured the heat of solution.

**SrBr<sub>2</sub> · 6 H<sub>2</sub>O (c).** The existing data yield the following values for *S*<sub>400</sub>: Thomsen,<sup>15</sup> -6.45; Maier<sup>2</sup> (see Hüttig and Slonim<sup>1</sup>), -7.11. Dissociation pressure data on the hexahydrate were reported by Trip,<sup>1</sup> Hüttig and Slonim,<sup>1</sup> and Lescoeur.<sup>2</sup>

**SrBr<sub>2</sub> · SrO · *n*H<sub>2</sub>O (c).** Tassilly<sup>1</sup> measured the heats of solution of the tri- and nonahydrates in aqueous HBr.

**SrI<sub>2</sub> (aq.).** The value for SrI<sub>2</sub> (∞) is obtained from those for the aqueous ions. We have estimated the heat of dilution of aqueous strontium iodide.

**SrI<sub>2</sub> (c).** For the heat of solution, Tassilly<sup>1</sup> found 20.5 and Maier<sup>2</sup> (see Slonim and Hüttig<sup>1</sup>) 20.6<sup>19</sup>.

**SrI<sub>2</sub> · *n*H<sub>2</sub>O (c).** Maier<sup>2</sup> (see Slonim and Hüttig<sup>1</sup>) measured the heats of solution of the mono-, di-, and hexahydrates. See also Tassilly.<sup>1, 4</sup>

Dissociation pressure data were reported by Trip<sup>1</sup> and Hüttig and Slonim.<sup>1</sup>

$\text{SrS (aq.)}$ . This value is obtained from those for the ions.

$\text{SrS (c.)}$ . Sabatier<sup>1</sup> measured the heat of solution in aqueous HCl.

$\text{Sr(HS)}_2 \text{ (aq.)}$ . Thomsen<sup>15</sup> measured the heat of reaction of  $\text{Sr(OH)}_2$  (aq.) with  $2 \text{ H}_2\text{S (aq.)}$ .

$\text{SrSO}_4 \text{ (aq.)}$ . The value for  $\text{SrSO}_4(\infty)$  is obtained from the ions. Thomsen<sup>15</sup> measured the heat of reaction of  $\text{Sr(OH)}_2$  (aq.) with  $\text{H}_2\text{SO}_4$  (aq.). Chroustchhoff and Martinoff<sup>1</sup> and Berthelot<sup>9</sup> measured the heats of reaction of  $\text{SrCl}_2$  (aq.) with  $\text{Na}_2\text{SO}_4$  (aq.) and of  $\text{SrSO}_4$  (aq.) with  $2 \text{ NaCl (aq.)}$ . We have estimated the values for the heat of dilution.

$\text{SrSO}_4 \text{ (c.)}$ . Barre<sup>1</sup> and Thomsen<sup>15</sup> reported the heat of solution of strontium sulfate to be 0.0.

$\text{SrS}_2\text{O}_6 \text{ (aq.)}$ . This value is obtained from those for the aqueous ions.

$\text{Sr(S}_2\text{O}_6)_2 \cdot 4 \text{ H}_2\text{O (c.)}$ . Thomsen<sup>15</sup> measured the heat of solution.

$\text{SrI}_2 \cdot n\text{SO}_2 \text{ (c.)}$ . Ephraim and Kornblum<sup>1</sup> measured the dissociation pressures of  $\text{SrI}_2 \cdot 2 \text{ SO}_2 \text{ (c.)}$  and  $\text{SrI}_2 \cdot 4 \text{ SO}_2 \text{ (c.)}$ .

$\text{SrSe (aq.)}$ . Fabre<sup>1</sup> measured the heat of neutralization of  $\text{Sr(OH)}_2$  (aq.) with  $\text{H}_2\text{Se (aq.)}$ .

$\text{SrSe (c.)}$ . Fabre<sup>1</sup> measured the heat of solution.

$\text{SrN}_6 \text{ (c.)}$ . Wohler and Martin<sup>1</sup> measured the heat of decomposition of strontium azide to be 49.0.

$\text{Sr}_3\text{N}_2 \text{ (c.)}$ . Guntz and Benoit<sup>1</sup> measured the heat of solution of strontium nitride in aqueous HCl.

$\text{SrN}_2\text{O}_2 \text{ (aq.)}$ . Berthelot<sup>10</sup> reported a value for the heat of neutralization of  $\text{Sr(OH)}_2$  (aq.) with  $\text{H}_2\text{N}_2\text{O}_2 \text{ (aq.)}$ .

$\text{SrN}_2\text{O}_2 \cdot 5 \text{ H}_2\text{O (c.)}$ . Berthelot<sup>10</sup> measured the heat of solution of the pentahydrate in bromine water.

$\text{Sr(NO}_3)_2 \text{ (aq.)}$ . Thomsen<sup>15</sup> and Berthelot<sup>9</sup> reported values for the heat of neutralization of  $\text{Sr(OH)}_2$  (aq.) with  $2 \text{ HNO}_3 \text{ (aq.)}$ . The value for  $\text{Sr(NO}_3)_2(\infty)$  is obtained from those for the ions. Data on the heat of dilution of aqueous strontium nitrate were reported by Pratt,<sup>1</sup> Thomsen,<sup>15</sup> Lange and Streeck,<sup>2</sup> and Hammerschmid and Lange.<sup>1</sup>

$\text{Sr(NO}_3)_2 \text{ (c.)}$ . The existing data yield the following values for  $S_{400}$ : Thomsen,<sup>15</sup>  $-4.62$ ; Pickering,<sup>7</sup>  $-5.04$ ; Berthelot,<sup>9, 131</sup>  $-5.1$ . See also Favre and Valson.<sup>2</sup>

$\text{Sr(NO}_3)_2 \cdot 4 \text{ H}_2\text{O (c.)}$ . The existing data yield for  $S_{400}$  the following values: Thomsen,<sup>15</sup>  $-12.30$ ; Pickering,<sup>7</sup>  $-6.8 (?)$ ; Favre and Silbermann,<sup>3</sup>  $-11.7$ ; Berthelot,<sup>9</sup>  $-12.1$ .

$\text{Sr(NH}_4)_2 \text{ (c.)}$ . Guntz and Benoit<sup>1</sup> measured the heat of solution in aqueous HCl.

$\text{Sr} \cdot 6 \text{ NH}_3 \text{ (c.)}$ . Biltz and Hüttig<sup>3</sup> measured the dissociation pressures.

$\text{SrX}_2 \cdot n\text{NH}_3 \text{ (c.)}$ . Hüttig<sup>2</sup> reported dissociation pressure data on the mono-, di-, and octammines of  $\text{SrCl}_2$  and  $\text{SrBr}_2$  and on the mono-, di-, hexa-, and octammines of  $\text{SrI}_2$ . Buffington<sup>1</sup> reported data on the di- and octammines of  $\text{SrCl}_2$ .

$\text{SrSO}_4 \cdot (\text{NH}_4)_2\text{SO}_4 \text{ (c.)}$ . Barre<sup>1</sup> measured the heat of solution.

$\text{Sr}_3(\text{PO}_4)_2$  (c, ppt.). Berthelot<sup>52, 101</sup> measured the heat of reaction of  $\text{H}_3\text{PO}_4$  (aq.) with  $1\frac{1}{2}\text{Sr}(\text{OH})_2$  (aq.). See also Joly.<sup>4</sup>

$\text{SrHPO}_4$  (aq.). Berthelot<sup>52, 101</sup> measured the heat of reaction of  $\text{H}_3\text{PO}_4$  (aq.) with  $\text{Sr}(\text{OH})_2$  (aq.). See also Joly.<sup>4</sup>

$\text{Sr}(\text{H}_2\text{PO}_4)_2$  (aq.). Berthelot<sup>52, 101</sup> measured the heat of reaction of  $\text{H}_3\text{PO}_4$  (aq.) with  $\frac{1}{2}\text{Sr}(\text{OH})_2$  (aq.). See also Joly.<sup>4</sup>

$\text{Sr}_3(\text{AsO}_4)_2$  (c, ppt.). Blarez<sup>1</sup> measured the heat of reaction of  $\text{H}_3\text{AsO}_4$  (aq.) with  $1\frac{1}{2}\text{Sr}(\text{OH})_2$  (aq.).

$\text{SrHAsO}_4$  (aq.). Blarez<sup>1</sup> measured the heat of reaction of  $\text{H}_3\text{AsO}_4$  (aq.) with  $\text{Sr}(\text{OH})_2$  (aq.).

$\text{Sr}(\text{H}_2\text{AsO}_4)_2$  (aq.). Blarez<sup>1</sup> measured the heat of reaction of  $\text{H}_3\text{AsO}_4$  (aq.) with  $\frac{1}{2}\text{Sr}(\text{OH})_2$  (aq.).

$\text{SrCO}_3$  (c). Thomsen<sup>15</sup> found  $Q=0.23$  for the reaction of  $\text{SrCl}_2$ (400) with  $\text{Na}_2\text{CO}_3$ (400). Dissociation pressure data were reported by Johnston<sup>1, 4</sup> and Dutoit.<sup>1</sup>

$\text{Sr}(\text{HCO}_3)_2$  (aq.). Randall and White<sup>8</sup> calculated, from the data of Haehnel,<sup>1, 2</sup>  $Q=6.74$  for the reaction,  $\text{SrCO}_3$  (c) +  $\text{CO}_2$  (g) +  $\text{H}_2\text{O}$  (liq.) =  $\text{Sr}(\text{HCO}_3)_2$  (aq.), and from the data of McCoy and Smith,<sup>1</sup>  $Q=1.94$  for the reaction,  $\text{SrCO}_3$  (c) +  $\text{H}_2\text{CO}_3$  (aq.) =  $\text{Sr}(\text{HCO}_3)_2$  (aq.).

$\text{Sr}(\text{CHO}_2)_2$  (aq.). Thomsen<sup>15</sup> measured the heat of neutralization of aqueous formic acid with aqueous strontium hydroxide.

$\text{Sr}(\text{CHO}_2)_2$  (c). Berthelot<sup>10, 131</sup> measured the heat of solution of strontium formate.

$\text{Sr}(\text{CHO}_2)_2 \cdot 2\text{H}_2\text{O}$  (c). Berthelot<sup>10, 131</sup> measured the heat of solution.

$\text{SrC}_2\text{O}_4 \cdot 2\frac{1}{2}\text{H}_2\text{O}$  (c). Berthelot<sup>10</sup> found  $Q=35.2$  for the reaction,  $\text{H}_2\text{C}_2\text{O}_4$  (aq.) +  $\text{Sr}(\text{OH})_2$  (aq.) +  $\frac{1}{2}\text{H}_2\text{O}$  (liq.) =  $\text{SrC}_2\text{O}_4 \cdot 2\frac{1}{2}\text{H}_2\text{O}$  (c).

$\text{Sr}(\text{C}_2\text{H}_3\text{O}_2)_2$  (aq.). Berthelot<sup>10, 131</sup> measured the heat of neutralization of aqueous strontium hydroxide with aqueous acetic acid. The value for strontium acetate at infinite dilution is obtained from those for the aqueous ions.

$\text{Sr}(\text{C}_2\text{H}_3\text{O}_2)_2$  (c). Berthelot<sup>10, 131</sup> measured the heat of solution.

$\text{Sr}(\text{C}_2\text{H}_3\text{O}_2)_2 \cdot \frac{1}{2}\text{H}_2\text{O}$  (c). Berthelot<sup>10, 131</sup> measured the heat of solution.

$\text{Sr}(\text{C}_2\text{H}_3\text{O}_3)_2$  (aq.). de Forcrand<sup>3</sup> measured the heat of neutralization of aqueous glycollic acid with aqueous strontium hydroxide.

$\text{Sr}(\text{C}_2\text{H}_3\text{O}_3)_2$  (c). de Forcrand<sup>3</sup> measured the heat of solution.

$\text{SrBr}_2 \cdot 1\frac{1}{2}\text{CH}_3\text{OH}$  (c). Lloyd, Brown, Bonnell, and Jones<sup>1</sup> measured the dissociation pressures of this alcoholate.

$\text{Sr}(\text{CN})_2$  (aq.). Joannis<sup>1</sup> measured the heat of neutralization of 2 HCN (aq.) with  $\text{Sr}(\text{OH})_2$  (aq.).

$\text{Sr}(\text{CN})_2 \cdot 4\text{H}_2\text{O}$  (c). Joannis<sup>1</sup> measured the heat of solution.

$\text{SrSiO}_3$  (gls.). Tschernobaeff<sup>1</sup> reported  $Q=-35.1$  for the reaction,  $\text{SrCO}_3$  (c) +  $\text{SiO}_2$  (c) =  $\text{SrSiO}_3$  (gls.) +  $\text{CO}_2$  (g).

$\text{SrI}_2 \cdot 2\text{PbI}_2 \cdot n\text{H}_2\text{O}$  (c). Mosnier<sup>1</sup> measured the heats of solution of the anhydrous double salt and of the heptahydrate.

$\text{SrHg}_{\infty}$  (liq.). The equilibrium data of Smith and Braley<sup>1</sup> yield 59.5 for the heat of solution of strontium in a very large amount of mercury.

$\text{SrBr}_2 \cdot n\text{HgBr}_2$  (aq.). Varet<sup>6</sup> measured the heats of mixing  $\text{SrBr}_2$  (aq.) with  $\frac{1}{2}$ , 1, and 2  $\text{HgBr}_2$  (aq.), respectively.

$\text{Sr}(\text{CN})_2 \cdot \text{Hg}(\text{CN})_2$  (aq.). Varet<sup>6</sup> measured the heats of mixing  $\text{Sr}(\text{CN})_2$  (aq.) with 1 and 2  $\text{Hg}(\text{CN})_2$  (aq.), respectively.

$\text{SrX}_2 \cdot 2\text{Hg}(\text{CN})_2$  (aq.). Varet<sup>6</sup> measured the heats of mixing 2  $\text{Hg}(\text{CN})_2$  (aq.) with  $\text{SrCl}_2$  (aq.),  $\text{SrBr}_2$  (aq.), and  $\text{SrI}_2$  (aq.), respectively.

$\text{SrX}_2 \cdot 2\text{Hg}(\text{CN})_2 \cdot n\text{H}_2\text{O}$  (c). Varet<sup>6</sup> measured the heats of solution of the chloride hexahydrate, the bromide hexahydrate, and the iodide heptahydrate.

$\text{Sr}(\text{CN})_2 \cdot n\text{AgCN}$  (aq.). Varet<sup>5</sup> measured the heat of reaction of  $\text{Sr}(\text{CN})_2$  (aq.) with 1 and 2  $\text{AgCN}$  (c), respectively.

$\text{Sr}(\text{CN})_2 \cdot \text{Ni}(\text{CN})_2$  (aq.). Varet<sup>4</sup> measured the heat of mixing  $\text{Sr}(\text{CN})_2$  (aq.) with  $\text{Ni}(\text{CN})_2$  (aq.).

3  $\text{SrCl}_2 \cdot 4\text{AlCl}_3$  (c). Baud<sup>1</sup> measured the heat of solution.

$\text{SrWO}_4$  (c). For the reaction,  $\text{SrO}$  (c) +  $\text{WO}_3$  (c) =  $\text{SrWO}_4$  (c), Tamman and Westerholt<sup>1</sup> reported  $Q = 56.4$  (?).

$\text{Sr}_3(\text{FeCO}(\text{CN})_5)_2$  (aq.). Muller<sup>9, 10</sup> measured the heat of neutralization of  $\text{H}_3\text{FeCO}(\text{CN})_5$  (aq.) with  $1\frac{1}{2}$   $\text{Sr}(\text{OH})_2$  (aq.).

$\text{Sr}_3(\text{FeCO}(\text{CN})_5)_2 \cdot n\text{H}_2\text{O}$  (c). Muller<sup>9, 10</sup> measured the heats of solution of the anhydrous salt and of the tetrahydrate.

## BARIUM

$\text{Ba}$  (c). Standard state.

$\text{Ba}$  (liq.). We have estimated the heat of fusion.

$\text{Ba}$  (g). We have estimated the heat of sublimation from the data of Ruff and Hartmann<sup>1</sup> and Hartmann and Schneider.<sup>1</sup> See also Sherman.<sup>1</sup> The energy states of gaseous monatomic barium are evaluated from the data of Hansen and Thorsen,<sup>1</sup> Russell and Saunders,<sup>1</sup> and Fowler.<sup>3</sup>

$\text{BaCl}_2$  (aq.). Guntz and Benoit<sup>1, 2</sup> found  $Q = 128.4$  for the reaction,  $\text{Ba}$  (c) + 2  $\text{HCl}$ (140) =  $\text{BaCl}_2$ (280) +  $\text{H}_2$  (g), at 7°; whence, for  $\text{BaCl}_2$  (200),  $Q_f = 207.3$ . With less pure samples, Thomsen<sup>15</sup> and Guntz<sup>3</sup> measured the heat of solution of barium in aqueous  $\text{HCl}$  and Guntz<sup>3</sup> that in water. Data on the heat of dilution of aqueous barium chloride were reported by Pratt,<sup>1</sup> Magie,<sup>1</sup> Richards and Dole,<sup>1</sup> Lehtonen,<sup>1</sup> Perreux,<sup>2</sup> Smith, Stearns, and Schneider,<sup>1</sup> and Lange and Streeck.<sup>1</sup>

$\text{Ba}^{++}(\infty)$ . This value is obtained from those for  $\text{BaCl}_2(\infty)$  and  $\text{Cl}^-(\infty)$ .

$\text{BaO}$  (c). de Forcrand<sup>11, 48, 51</sup> measured the heat of solution of barium oxide in 600  $\text{H}_2\text{O}$  to be 35.64 at 15°. For the heat of solution of barium oxide in aqueous  $\text{HCl}$ , Berthelot<sup>22</sup> found 55.58 in 2  $\text{HCl}$ (300) at 11°, and Thomsen<sup>15</sup> 62.30 in 2  $\text{HCl}$ (200) at 18°.

$\text{BaO}$  (g). Vapor pressure data were reported by Thompson and Armstrong<sup>1</sup> and Classen and Veeneman.<sup>1</sup>

**BaO<sub>2</sub> (c).** Berthelot<sup>30, 61</sup> measured the heat of solution of barium peroxide in aqueous HCl and in aqueous (SnCl<sub>2</sub>+5 HCl). Dissociation pressure data on BaO<sub>2</sub> (c) were reported by LeChatelier<sup>6</sup> and Hildebrand,<sup>1</sup> and reviewed by Biltz<sup>8</sup> and Lewis and Randall.<sup>5</sup>

**BaO<sub>2</sub> · nH<sub>2</sub>O (c).** Berthelot<sup>61</sup> measured the heat of solution of the mono- and decahydrates in aqueous HCl, and de Forcrand<sup>26, 27</sup> that of the decahydrate.

**BaO<sub>2</sub> · H<sub>2</sub>O<sub>2</sub> (c).** Berthelot<sup>61</sup> and de Forcrand<sup>26, 27</sup> measured the heat of solution in aqueous HCl.

**Ba(OH)<sub>2</sub> (aq.).** Data on the heat of neutralization of Ba(OH)<sub>2</sub> (aq.) with 2 HCl (aq.) were reported by Anderson and Noyes,<sup>1</sup> von Steinwehr,<sup>1</sup> Berthelot,<sup>22</sup> and Thomsen.<sup>15</sup> The value for barium hydroxide at infinite dilution is obtained from those for aqueous barium and hydroxyl ions.

**Ba(OH)<sub>2</sub> (c).** The data on the heat of solution of barium hydroxide are: Thomsen,<sup>15</sup> 12.26<sub>800</sub>; Berthelot,<sup>22</sup> 40.0 and 38.0 in aqueous HCl; de Forcrand,<sup>11, 48, 51</sup> 11.60<sub>660</sub><sup>15</sup>. See also Johnston.<sup>5</sup>

**Ba(OH)<sub>2</sub> · nH<sub>2</sub>O (c).** de Forcrand<sup>11, 48, 51</sup> measured the heat of solution of the monohydrate. For the heat of solution of the octahydrate, the data are: Thomsen,<sup>15</sup> -15.21<sub>800</sub>; Berthelot,<sup>22</sup> -13.0; de Forcrand,<sup>51</sup> -14.50<sub>660</sub><sup>15</sup>; Sill,<sup>1</sup> -15.8.

**BaH<sub>2</sub> (c).** For the heat of solution of barium hydride in aqueous HCl at 7°, Guntz and Benoit<sup>1</sup> found 87.6. See also Guntz<sup>16</sup> and Kassarnowsky.<sup>1, 2</sup>

**Ba<sub>2</sub>O (c).** Benoit<sup>2</sup> measured the heat of solution in aqueous HCl.

**BaF<sub>2</sub> (aq.).** The value for infinite dilution is obtained from those for the aqueous ions.

**BaF<sub>2</sub> (c).** Petersen<sup>3</sup> measured the heat of reaction of BaCl<sub>2</sub> (aq.) with 2 AgF (aq.). Guntz<sup>1</sup> and Petersen<sup>3</sup> measured the heat of reaction of Ba(OH)<sub>2</sub> (aq.) with 2 HF (aq.). Petersen<sup>3</sup> reported the heat of solution of BaF<sub>2</sub> (c) to be -2.0.

**BaCl<sub>2</sub> (c).** Data on the heat of solution of barium chloride were reported by Thomsen,<sup>15</sup> Berthelot,<sup>7, 22</sup> Berthelot and Ilosvay,<sup>1</sup> Benoit,<sup>2</sup> Baud,<sup>1</sup> Schottky,<sup>1</sup> Kolosovskii,<sup>5</sup> and Lehtonen.<sup>1</sup> See also Cambi and Devoto.<sup>1</sup>

**BaCl<sub>2</sub> · H<sub>2</sub>O (c).** Schottky<sup>1</sup> measured the heat of solution. Dissociation pressure data were reported by Foote and Scholes,<sup>1</sup> Lescoeur,<sup>2</sup> Muller-Erbach,<sup>1</sup> and Trip<sup>1</sup> (see Hüttig and Slonim<sup>1</sup>).

**BaCl<sub>2</sub> · 2 H<sub>2</sub>O (c).** Data on the heat of solution of the dihydrate were reported by Thomsen,<sup>15</sup> Berthelot,<sup>7</sup> Favre and Silbermann,<sup>3</sup> Kolosovskii,<sup>5</sup> Perreu,<sup>1</sup> and Favre and Valson.<sup>2</sup> Dissociation pressure data were reported by Trip<sup>1</sup> (see Hüttig and Slonim<sup>1</sup>), Baxter and Cooper,<sup>1</sup> Menzies,<sup>1</sup> Foote and Scholes,<sup>1</sup> Schumb,<sup>1</sup> Frowein,<sup>1</sup> Schottky,<sup>1</sup> Cohen,<sup>4</sup> Muller-Erbach,<sup>3, 4</sup> Partington,<sup>1</sup> and Lescoeur.<sup>2</sup>

**Ba(ClO)<sub>2</sub> (aq.).** Berthelot<sup>26</sup> and Neumann and Muller<sup>2</sup> measured the heat of reaction of Ba(OH)<sub>2</sub> (aq.) with Cl<sub>2</sub> (g), and Neumann and Muller<sup>2</sup> that of Ba(OH)<sub>2</sub> (aq.) with 2 HClO (aq.).

$\text{Ba}(\text{ClO}_2)_2$  (c). Bruni and Levi<sup>1</sup> reported the heat of dissociation of barium chlorite into barium chloride and oxygen.

$\text{Ba}(\text{ClO}_3)_2$  (aq.). Berthelot<sup>29</sup> and Thomsen<sup>15</sup> measured the heat of reduction of aqueous barium chlorate with aqueous sulfur dioxide. The value for  $\text{Ba}(\text{ClO}_3)_2$  ( $\infty$ ) is obtained from those for the aqueous ions at infinite dilution.

$\text{Ba}(\text{ClO}_3)_2$  (c). Berthelot<sup>9</sup> measured the heat of solution.

$\text{Ba}(\text{ClO}_3)_2 \cdot \text{H}_2\text{O}$  (c). For the heat of solution, Thomsen<sup>15</sup> found  $-11.24_{600}$  and Berthelot<sup>9</sup>  $-11.48_{500}$ <sup>10</sup>.

$\text{Ba}(\text{ClO}_4)_2$  (aq.). Thomsen<sup>15</sup> and Berthelot<sup>79</sup> measured the heat of neutralization of aqueous perchloric acid with aqueous barium hydroxide. The value for  $\text{Ba}(\text{ClO}_4)_2$  ( $\infty$ ) is obtained from those for  $\text{Ba}^{++}$  ( $\infty$ ) and  $\text{ClO}_4^-$  ( $\infty$ ).

$\text{Ba}(\text{ClO}_4)_2 \cdot n\text{H}_2\text{O}$  (c). Berthelot<sup>9</sup> measured the heats of solution of the anhydrous salt and the trihydrate.

$\text{BaCl}_2 \cdot \text{BaO} \cdot n\text{H}_2\text{O}$  (c). Andre<sup>1, 3</sup> measured the heats of solution of the tri-, penta-, and octahydrates, but reported his results in terms of the heat of the reaction,  $\text{BaCl}_2$  (c) +  $\text{BaO}$  (c) +  $n\text{H}_2\text{O}$  (liq.) =  $\text{BaCl}_2 \cdot \text{BaO} \cdot n\text{H}_2\text{O}$  (c), without stating the values used for the heat of formation of  $\text{BaO}$  (c). However, the value of  $Q_f$  for the pentahydrate can be computed from the data of Tassilly<sup>4</sup> who measured its heat of solution in aqueous HCl to be 18.5, and the differences between the various hydrates can then be obtained from the data of Andre.<sup>1, 3</sup>

$\text{BaBr}_2$  (aq.). The value for barium bromide at infinite dilution is obtained from those for the aqueous ions. Data on the heat of dilution of aqueous barium bromide were reported by Lange and Streeck.<sup>1</sup>

$\text{BaBr}_2$  (c). The data on the heat of solution are: Thomsen,<sup>15</sup> 4.98<sub>400</sub>; Varet,<sup>2</sup> 4.0. See also Cambi and Devoto.<sup>1</sup>

$\text{BaBr}_2 \cdot \text{H}_2\text{O}$  (c). Dissociation pressure data were reported by Lescoeur<sup>7</sup> and Trip<sup>1</sup> (see Hüttig and Slonim<sup>1</sup>).

$\text{Ba}(\text{BrO})_2$  (aq.). Berthelot<sup>45</sup> measured the heat of reaction of aqueous barium hydroxide with bromine.

$\text{Ba}(\text{BrO}_3)_2$  (aq.). These values are obtained from those for the ions.

$\text{Ba}(\text{BrO}_3)_2 \cdot \text{H}_2\text{O}$  (c). Greensfelder and Latimer<sup>1</sup> measured the heat of solution.

$\text{BaBr}_2 \cdot \text{BaO} \cdot n\text{H}_2\text{O}$  (c). Tassilly<sup>5</sup> measured the heats of solution of the di- and pentahydrates in aqueous HBr.

$\text{BaI}_2$  (aq.). The value for infinite dilution is obtained from those for the aqueous ions. We have estimated the heat of dilution.

$\text{BaI}_2$  (c). Tassilly<sup>1, 3</sup> measured the heat of solution. See also Cambi and Devoto.<sup>1</sup>

$\text{BaI}_2 \cdot n\text{H}_2\text{O}$  (c). Thomsen<sup>15</sup> measured the heat of solution of the heptahydrate. Dissociation pressure data on the hydrates with 1, 2, 2½, and 7 H<sub>2</sub>O were reported by Trip<sup>1</sup> (see Hüttig and Slonim<sup>1</sup>).

$\text{Ba}(\text{IO}_3)_2$  (aq.). This value is obtained from those for the aqueous ions.

**Ba(IO<sub>3</sub>)<sub>2</sub> (c).** Chroustchoff<sup>1</sup> measured the heat of reaction of this salt with K<sub>2</sub>SO<sub>4</sub> (aq.) to be -4.6.

**Ba(IO<sub>3</sub>)<sub>2</sub> · H<sub>2</sub>O (c).** Chroustchoff<sup>1</sup> measured the heats of reaction of BaCl<sub>2</sub> (aq.) with 2 KIO<sub>3</sub> (aq.), of Ba(NO<sub>3</sub>)<sub>2</sub> (aq.) with 2 KIO<sub>3</sub> (aq.), and of Ba(NO<sub>3</sub>)<sub>2</sub> (aq.) with 2 HIO<sub>3</sub> (aq.) to be 11.0, 10.6, and 13.5, respectively, at 13°. The iodate formed in these reactions is barium iodate monohydrate.

**BaI<sub>2</sub> · BaO · nH<sub>2</sub>O (c).** Tassilly<sup>1</sup> measured the heats of solution of the di- and nonahydrates in aqueous HI.

**BaS (aq.).** Thomsen<sup>15</sup> and Sabatier<sup>1</sup> measured the heat of neutralization of H<sub>2</sub>S (aq.) with Ba(OH)<sub>2</sub> (aq.). The value for infinite dilution is obtained from those for the aqueous ions.

**BaS (c).** Sabatier<sup>1</sup> measured the heat of solution in aqueous HCl.

**BaSO<sub>3</sub> (c).** de Forcrand<sup>3</sup> measured the heat of reaction of H<sub>2</sub>SO<sub>3</sub> (aq.) with Ba(OH)<sub>2</sub> (aq.).

**Ba(HSO<sub>3</sub>)<sub>2</sub> (aq.).** de Forcrand<sup>3</sup> measured the heat of reaction of Ba(OH)<sub>2</sub> (aq.) with 2 H<sub>2</sub>SO<sub>3</sub> (aq.).

**BaSO<sub>4</sub> (c).** Thomsen<sup>15</sup> measured the heats of the reactions of Ba(OH)<sub>2</sub>(400) with H<sub>2</sub>SO<sub>4</sub>(400) and of BaCl<sub>2</sub>(400) with H<sub>2</sub>SO<sub>4</sub>(400) to be 36.90 and 4.15, respectively; whence, for BaSO<sub>4</sub> (c),  $Q_f = 349.49$  and 349.20. See also Berthelot<sup>9</sup> and Muller.<sup>10</sup> Melcher<sup>1</sup> calculated the heat of solution of barium sulfate to be -6.0, from conductivity measurements at various temperatures.

**BaS<sub>2</sub>O<sub>6</sub> (aq.).** Thomsen<sup>15</sup> measured the heat of reaction of BaS<sub>2</sub>O<sub>6</sub> (aq.) with H<sub>2</sub>SO<sub>4</sub>(400).

**BaS<sub>2</sub>O<sub>6</sub> · 2 H<sub>2</sub>O (c).** Thomsen<sup>15</sup> measured the heat of solution.

**BaS<sub>2</sub>O<sub>6</sub> (aq.).** Berthelot<sup>107</sup> measured the heat of reaction of BaS<sub>2</sub>O<sub>6</sub> (aq.) with H<sub>2</sub>SO<sub>4</sub> (aq.).

**BaS<sub>2</sub>O<sub>6</sub> · 4 H<sub>2</sub>O (c).** Berthelot<sup>107</sup> measured the heat of solution.

**BaS<sub>4</sub>O<sub>6</sub> (aq.).** This value is obtained from the ions.

**BaS<sub>4</sub>O<sub>6</sub> · 2 H<sub>2</sub>O (c).** Portillo<sup>1</sup> measured the heat of solution.

**Ba(HS)<sub>2</sub> (aq.).** Thomsen<sup>15</sup> measured the heat of reaction of Ba(OH)<sub>2</sub> (aq.) with 2 H<sub>2</sub>S (aq.).

**BaSO<sub>4</sub> · H<sub>2</sub>SO<sub>4</sub> (c).** Volchowsky<sup>1</sup> measured the heat of solution.

**BaSO<sub>4</sub> · 2 H<sub>2</sub>SO<sub>4</sub> · H<sub>2</sub>O (c).** Volchowsky<sup>1</sup> measured the heat of solution.

**BaI<sub>2</sub> · nSO<sub>2</sub> (c).** Ephraim and Kornblum<sup>1</sup> reported dissociation pressure data on BaI<sub>2</sub> · 2 SO<sub>2</sub> (c) and BaI<sub>2</sub> · 4 SO<sub>2</sub> (c).

**BaSe (c).** Fabre<sup>1</sup> measured the heat of solution in aqueous HCl.

**BaSeO<sub>4</sub> (c).** Metzner<sup>1</sup> measured the heat of reaction of BaCl<sub>2</sub> (aq.) with H<sub>2</sub>SeO<sub>4</sub> (aq.).

**Ba(N<sub>3</sub>)<sub>2</sub> (aq.).** Berthelot and Matignon measured the heat of neutralization of 2 HN<sub>3</sub> (aq.) with Ba (OH)<sub>2</sub> (aq.).

**Ba(N<sub>3</sub>)<sub>2</sub> (c).** Berthelot and Matignon measured the heat of solution.

**Ba<sub>3</sub>N<sub>2</sub> (c).** Guntz and Benoit<sup>1</sup> measured the heat of solution in aqueous HCl. See also Guntz.<sup>16</sup>

$\text{Ba}(\text{NO}_2)_2$  (aq.). Berthelot<sup>28</sup> measured the heat of reaction of  $\text{Ba}(\text{NO}_2)_2$  (aq.) with  $\text{H}_2\text{SO}_4$  (aq.).

$\text{Ba}(\text{NO}_2)_2$  (c). Berthelot<sup>28</sup> measured the heat of solution

$\text{Ba}(\text{NO}_2)_2 \cdot 2 \text{H}_2\text{O}$  (c). Berthelot<sup>28</sup> measured the heat of solution.

$\text{Ba}(\text{NO}_3)_2$  (aq.). Thomsen<sup>15</sup> measured the heats of reaction of  $\text{H}_2\text{SO}_4$  (400) with  $\text{Ba}(\text{OH})_2$  (400) and  $\text{Ba}(\text{NO}_3)_2$  (400) to be 28.28 and 8.56, respectively; whence, for  $\text{Ba}(\text{NO}_3)_2$  (800),  $Q_f = 227.19$  and  $227.92$ . Berthelot<sup>9, 12</sup> reported  $Q = 28.0$  and  $5.2$  for the reactions of  $\text{H}_2\text{SO}_4$  (400) with  $\text{Ba}(\text{OH})_2$  (400) and of  $\text{Ba}(\text{NO}_3)_2$  (400) with  $\text{K}_2\text{SO}_4$  (400). Data on the heat of dilution of aqueous barium nitrate were reported by Pratt,<sup>1</sup> Bishop,<sup>1</sup> Stackelberg,<sup>1</sup> Lange and Streeck,<sup>2</sup> and Hammerschmid and Lange.<sup>1</sup>

$\text{Ba}(\text{NO}_3)_2$  (c). The data on the heat of solution are: Thomsen,<sup>15</sup>  $-9.47_{400}$ ; Stackelberg,<sup>1</sup>  $-10.03_{1000}$ <sup>16</sup>; Berthelot,<sup>9, 131</sup>  $-9.28_{1000}$ <sup>12</sup>.

$\text{BaNH}$  (c). Guntz and Benoit<sup>1</sup> measured the heat of solution in aqueous  $\text{HCl}$ .

$\text{Ba}(\text{NH}_2)_2$  (c). Guntz and Benoit<sup>1</sup> measured the heat of solution in aqueous  $\text{HCl}$ .

$\text{Ba} \cdot 6 \text{NH}_3$  (c). Biltz and Hüttig<sup>2</sup> measured the dissociation pressure.

$\text{BaX}_2 \cdot n\text{NH}_3$  (c). Dissociation pressure data on the octammine of barium chloride were reported by Hüttig and Martin<sup>1</sup> and Gillespie and Lurie.<sup>1</sup> Hüttig and Martin<sup>1</sup> reported dissociation pressure data on the amines of  $\text{BaBr}_2$  with 1, 2, 4, and 8  $\text{NH}_3$ , and those of  $\text{BaI}_2$  with 2, 4, 6, 8, 9, and 10  $\text{NH}_3$ .

$\text{Ba}_3(\text{PO}_4)_2$  (c, ppt.). Berthelot and Louguinine<sup>3</sup> recomputed the data of Berthelot,<sup>52</sup> who measured the heat of reaction of  $\text{H}_3\text{PO}_4$  (aq.) with  $1\frac{1}{2} \text{Ba}(\text{OH})_2$  (aq.) to form the crystalline precipitate and also to form the colloid, to be 60.8 and 78.2, respectively. See also Joly.<sup>3, 4</sup>

$\text{BaHPO}_4$  (aq.). Berthelot and Louguinine<sup>3</sup> recomputed Berthelot's<sup>52</sup> data on the heat of reaction of  $\text{H}_3\text{PO}_4$  (aq.) with  $\text{Ba}(\text{OH})_2$  (aq.). See also Berthelot<sup>101</sup> and Joly.<sup>3, 4</sup>

$\text{Ba}(\text{H}_2\text{PO}_4)_2$  (aq.). Berthelot and Louguinine<sup>3</sup> recalculated the data of Berthelot<sup>52</sup> on the heat of reaction of  $\text{H}_3\text{PO}_4$  (aq.) with  $\frac{1}{2} \text{Ba}(\text{OH})_2$  (aq.). See also Joly.<sup>3, 4</sup>

$\text{BaH}_2\text{P}_2\text{O}_6$  (aq.). Joly<sup>3</sup> measured the heat of reaction of  $\text{H}_4\text{P}_2\text{O}_6$  (aq.) with  $\text{Ba}(\text{OH})_2$  (aq.) to be 35.4.

$\text{Ba}(\text{H}_2\text{PO}_2)_2$  (aq.). Thomsen<sup>15</sup> measured the heat of reaction of this substance with  $\text{H}_2\text{SO}_4$  (aq.).

$\text{Ba}(\text{H}_2\text{PO}_2)_2 \cdot \text{H}_2\text{O}$  (c). Thomsen<sup>15</sup> measured the heat of solution.

$\text{Ba}_3(\text{AsO}_4)_2$  (c, ppt.). Blarez<sup>2</sup> measured the heat of reaction of  $\text{H}_3\text{AsO}_4$  (aq.) with  $1\frac{1}{2} \text{Ba}(\text{OH})_2$  (aq.).

$\text{BaHAsO}_4$  (aq.). Blarez<sup>2</sup> measured the heat of reaction of  $\text{H}_3\text{AsO}_4$  (aq.) with  $\text{Ba}(\text{OH})_2$  (aq.). See also Joly.<sup>3</sup>

$\text{Ba}(\text{H}_2\text{AsO}_4)_2$  (aq.). Blarez<sup>2</sup> measured the heat of reaction of  $\text{H}_3\text{AsO}_4$  (aq.) with  $\frac{1}{2} \text{Ba}(\text{OH})_2$  (aq.).

**BaHAsO<sub>3</sub> (aq.).** Thomsen<sup>15</sup> measured the heat of reaction of H<sub>3</sub>AsO<sub>3</sub> (aq.) with Ba(OH)<sub>2</sub> (aq.).

**Ba(H<sub>2</sub>AsO<sub>3</sub>)<sub>2</sub> (aq.).** Thomsen<sup>15</sup> measured the heat of reaction of H<sub>3</sub>AsO<sub>3</sub> (aq.) with  $\frac{1}{2}$  Ba(OH)<sub>2</sub> (aq.).

**BaCO<sub>3</sub> (c).** Thomsen<sup>15</sup> measured the heats of reaction of BaCl<sub>2</sub> (aq.) with Na<sub>2</sub>CO<sub>3</sub> (aq.) and with K<sub>2</sub>CO<sub>3</sub> (aq.), and the heat of neutralization of H<sub>2</sub>CO<sub>3</sub> (aq.) with Ba(OH)<sub>2</sub> (aq.). See also Berthelot.<sup>9, 12</sup> Dissociation pressure data were reported by Johnston,<sup>5</sup> Dutoit,<sup>1</sup> Abich,<sup>1</sup> Isambert,<sup>4</sup> Brill,<sup>2</sup> and Finkelstein.<sup>1</sup>

**BaO · BaCO<sub>3</sub> (c).** Finkelstein<sup>1</sup> reported dissociation pressure data for the reaction, 2 BaCO<sub>3</sub> (c) = BaO · BaCO<sub>3</sub> (c) + CO<sub>2</sub> (g).

**BaC<sub>2</sub>O<sub>4</sub> · H<sub>2</sub>O (c).** Berthelot<sup>10</sup> measured the heat of reaction of aqueous oxalic acid with aqueous barium hydroxide to form the monohydrate.

**Ba(HCO<sub>3</sub>)<sub>2</sub> (aq.).** Randall and Tamale<sup>2</sup> reviewed the data of Schloesing,<sup>1, 2</sup> Haehnlel,<sup>1, 2</sup> and McCoy and Smith<sup>1</sup> on the solubility of barium carbonate in aqueous carbonic acid, and calculated  $Q = 7.86$  for the reaction, BaCO<sub>3</sub> (c) + CO<sub>2</sub> (g) + H<sub>2</sub>O (liq.) = Ba(HCO<sub>3</sub>)<sub>2</sub> (aq.).

**Ba(CHO<sub>2</sub>)<sub>2</sub> (aq.).** Berthelot<sup>31</sup> measured the heats of reaction of Ba(CHO<sub>2</sub>)<sub>2</sub> (aq.) with 2 HCl (aq.), of BaCl<sub>2</sub> (aq.) with 2 HCHO<sub>2</sub> (aq.), and of H<sub>2</sub>SO<sub>4</sub> (aq.) with Ba(CHO<sub>2</sub>)<sub>2</sub> (aq.).

**Ba(CHO<sub>2</sub>)<sub>2</sub> (c).** Berthelot<sup>7</sup> measured the heat of solution of barium formate.

**Ba(C<sub>2</sub>H<sub>3</sub>O<sub>2</sub>)<sub>2</sub> (aq.).** Thomsen<sup>15</sup> measured the heat of reaction of aqueous barium acetate with aqueous sulfuric acid. Berthelot<sup>7, 9</sup> and Thomsen<sup>15</sup> measured the heat of neutralization of aqueous barium hydroxide with aqueous acetic acid. The value for barium acetate at infinite dilution is obtained from those for the aqueous ions.

**Ba(C<sub>2</sub>H<sub>3</sub>O<sub>2</sub>)<sub>2</sub> (c).** Berthelot<sup>7, 9</sup> measured the heat of solution.

**Ba(C<sub>2</sub>H<sub>3</sub>O<sub>2</sub>)<sub>2</sub> · 3 H<sub>2</sub>O (c).** Berthelot<sup>7, 9</sup> measured the heat of solution.

**Ba(C<sub>2</sub>H<sub>3</sub>O<sub>3</sub>)<sub>2</sub> (aq.).** The value for aqueous barium glycollate is obtained from those for the ions.

**Ba(C<sub>2</sub>H<sub>3</sub>O<sub>3</sub>)<sub>2</sub> (c).** de Forcrand<sup>3</sup> measured the heat of solution of barium glycollate.

**3 BaO · 4 CH<sub>3</sub>OH (c).** de Forcrand<sup>2, 16, 18</sup> measured the heat of solution in aqueous HCl.

**3 BaO · 4 C<sub>2</sub>H<sub>5</sub>OH (c).** de Forcrand<sup>2, 16, 18</sup> measured the heat of solution.

**Ba(C<sub>2</sub>H<sub>5</sub>O)<sub>2</sub> (c).** de Forcrand<sup>2, 16, 18</sup> measured the heat of solution.

**Ba(C<sub>2</sub>H<sub>5</sub>SO<sub>4</sub>)<sub>2</sub> (aq.).** Thomsen<sup>15</sup> measured the heat of reaction of Ba(C<sub>2</sub>H<sub>5</sub>SO<sub>4</sub>)<sub>2</sub>(400) with H<sub>2</sub>SO<sub>4</sub>(400) to be 9.34.

**Ba(C<sub>2</sub>H<sub>5</sub>SO<sub>4</sub>)<sub>2</sub> · 2 H<sub>2</sub>O (c).** Thomsen<sup>15</sup> measured the heat of solution.

**Ba(CN)<sub>2</sub> (aq.).** Joannis<sup>1</sup> measured the heat of neutralization of 2 HCN (aq.) with Ba(OH)<sub>2</sub> (aq.).

$\text{Ba}(\text{CN})_2 \cdot n\text{H}_2\text{O}$  (c). Joannis<sup>1</sup> measured the heats of solution of the anhydrous salt and the mono- and dihydrates.

$\text{BaSiO}_3$  (gls.). Tschernobaeff<sup>1</sup> reported  $Q = -41.0$  for the reaction,  $\text{SiO}_2$  (c) +  $\text{BaCO}_3$  (c) =  $\text{BaSiO}_3$  (gls.) +  $\text{CO}_2$  (g), from calorimetric experiments, and Jander<sup>1</sup> calculated  $Q = -34.0$  for the same reaction from equilibrium data. These data yield, for  $\text{BaSiO}_3$  (gls.),  $Q_f = 359$  and 366. See also Marchal.<sup>1</sup>

$\text{Ba}(\text{CNO})_2$  (aq.). Lemoult<sup>1</sup> measured the heats of decomposition of aqueous barium cyanate with aqueous sulfuric acid and with aqueous nitric acid.

$\text{Ba}(\text{CNO})_2$  (c). Lemoult<sup>1</sup> measured the heat of solution.

$\text{BaSiF}_6$  (c). Hantke<sup>1</sup> measured the heat of reaction of  $\text{H}_2\text{SiF}_6$  (aq.) with  $\text{Ba}(\text{OH})_2$  (aq.), and also the dissociation pressures of  $\text{BaSiF}_6$  (c).

$\text{BaI}_2 \cdot 2 \text{PbI}_2 \cdot n\text{H}_2\text{O}$  (c). Mosnier<sup>1</sup> measured the heats of solution of the anhydrous double salt and the heptahydrate.

$\text{BaBr}_2 \cdot n\text{HgBr}_2$  (aq.). Varet<sup>6</sup> measured the heats of mixing  $\text{BaBr}_2$  (aq.) with  $\frac{1}{2}$ , 1, and 2  $\text{HgBr}_2$  (aq.), respectively.

$\text{Ba}(\text{CN})_2 \cdot n\text{Hg}(\text{CN})_2$  (aq.). Varet<sup>2</sup> measured the heats of mixing  $\text{Ba}(\text{CN})_2$  (aq.) with  $\frac{1}{2}$ , 1, and 2  $\text{Hg}(\text{CN})_2$  (aq.), respectively.

$\text{BaX}_2 \cdot 2 \text{Hg}(\text{CN})_2$  (aq.). Varet<sup>2, 6</sup> measured the heats of mixing 2  $\text{Hg}(\text{CN})_2$  (aq.) with  $\text{BaCl}_2$  (aq.),  $\text{BaBr}_2$  (aq.), and  $\text{BaI}_2$  (aq.), respectively.

$\text{BaX}_2 \cdot 2 \text{Hg}(\text{CN})_2 \cdot n\text{H}_2\text{O}$  (c). Varet<sup>2, 6</sup> measured the heats of solution of the chloride pentahydrate, the bromide hexahydrate, and the iodide tetrahydrate.

$\text{Ba}(\text{CN})_2 \cdot n\text{AgCN}$  (aq.). Varet<sup>1</sup> measured the heats of reaction of  $\text{Ba}(\text{CN})_2$  (aq.) with 1 and 2  $\text{AgCN}$  (c), respectively.

$\text{BaPtCl}_6$  (aq.). This value is obtained from the ions. Gire<sup>1, 3</sup> measured the heat of reaction of aqueous barium chloroplatinate with cobalt.

$\text{BaPtCl}_6 \cdot n\text{H}_2\text{O}$  (c). Gire<sup>1, 3</sup> measured the heats of solution of the anhydrous salt and the hexahydrate, and the dissociation pressures of  $\text{BaPtCl}_6$  (c).

$\text{Ba}_2\text{Fe}(\text{CN})_6$  (aq.). Joannis<sup>1</sup> measured the heat of reaction of  $\text{H}_4\text{Fe}(\text{CN})_6$  (aq.) with 2  $\text{Ba}(\text{OH})_2$  (aq.).

$\text{BaH}_2\text{Fe}(\text{CN})_6$  (aq.). Joannis<sup>1</sup> measured the heat of reaction of  $\text{H}_4\text{Fe}(\text{CN})_6$  (aq.) with  $\text{Ba}(\text{OH})_2$  (aq.).

$\text{Ba}_2\text{Fe}(\text{CN})_6 \cdot 6 \text{H}_2\text{O}$  (c). Joannis<sup>1</sup> measured the heat of solution.

$\text{Ba}_3(\text{FeCO}(\text{CN})_5)_2$  (aq.). Muller<sup>9, 10</sup> measured the heat of reaction of  $\text{H}_3\text{FeCO}(\text{CN})_5$  (aq.) with  $1\frac{1}{2}$   $\text{Ba}(\text{OH})_2$  (aq.).

$\text{Ba}_3(\text{FeCO}(\text{CN})_5)_2 \cdot n\text{H}_2\text{O}$  (c). Muller<sup>9, 10</sup> measured the heats of solution of the anhydrous salt and of the undecahydrate.

$\text{BaHFeCO}(\text{CN})_5$  (aq.). Muller<sup>9, 10</sup> measured the heat of reaction of  $\text{H}_3\text{FeCO}(\text{CN})_5$  (aq.) with  $\text{Ba}(\text{OH})_2$  (aq.).

$\text{Ba}(\text{H}_2\text{FeCO}(\text{CN})_5)_2$  (aq.). Muller<sup>9, 10</sup> measured the heat of reaction of  $\text{H}_3\text{FeCO}(\text{CN})_5$  (aq.) with  $\frac{1}{2}$   $\text{Ba}(\text{OH})_2$  (aq.).

$\text{Ba}(\text{CN})_2 \cdot \text{Ni}(\text{CN})_2$  (aq.). Varet<sup>4</sup> measured the heats of mixing  $\text{Ba}(\text{CN})_2$  (aq.) with  $\text{Ni}(\text{CN})_2$  (aq.).

$\text{BaCrO}_4$  (c). Chroustschoff and Martinoff<sup>1</sup> found  $Q=6.8$  for the reaction of  $\text{BaCl}_2$  (aq.) with  $\text{K}_2\text{CrO}_4$  (aq.).

$\text{BaCl}_2 \cdot 2 \text{AlCl}_3$  (c). Baud<sup>1</sup> measured the heat of solution.

$3 \text{BaCl}_2 \cdot \text{AlCl}_3$  (c). Baud<sup>1</sup> measured the heat of solution.

$\text{BaMoO}_4$  (c). Tammann and Westerholt<sup>1</sup> reported  $Q=60.1$  for the reaction of  $\text{BaO}$  (c) with  $\text{MoO}_3$  (c).

$\text{BaWO}_4$  (c). Tammann and Westerholt<sup>1</sup> reported  $Q=73.5$  for the reaction of  $\text{BaO}$  (c) with  $\text{WO}_3$  (c).

## RADIUM

$\text{Ra}$  (c). Standard state.

## LITHIUM

$\text{Li}$  (c). Standard state.

$\text{Li}$  (liq.). Thum<sup>1</sup> reported for the heat of fusion the value  $-0.23$ ; Sherman<sup>1</sup> calculated  $-0.115$ . Both of these values seem too low, because the entropy of fusion of the other alkali metals has the nearly constant value of 1.68 calories per degree per mole, and yields, for the heat of fusion,  $-0.77$ .

$\text{Li}$  (g). Vapor pressure data were reported by Bogros<sup>1</sup> and Hartmann and Schneider.<sup>1</sup> Utilizing the data of the latter investigation, and neglecting the small effect due to the probable existence of some diatomic molecules in the vapor, we have calculated, for  $\text{Li}$  (g),  $Q_f = -39.0$ . See also Sherman,<sup>1</sup> Joos and Hüttig,<sup>1</sup> and van Laar.<sup>9</sup>

The values for the energy states of the gaseous lithium atom are from the data of Ericson and Edlen<sup>1</sup> and Edlen and Ericson.<sup>3</sup> See also Bacher and Goudsmit.<sup>1</sup>

$\text{Li}_2$  (g). Loomis and Nusbaum<sup>1</sup> reported the energy of dissociation,  $\text{Li}_2$  (g)  $= 2 \text{Li}$  (g), with each substance in its normal state, to be  $1.14 \pm 0.03$  volt-electrons.

$\text{LiOH}$  (aq.). The heat of solution of  $\text{Li}$  (c) in water was measured by Thomsen,<sup>15</sup> Guntz,<sup>3</sup> Zukowsky,<sup>1</sup> and Moers.<sup>1</sup> These data have been recomputed, and give, respectively, for  $\text{Li}$  (c) +  $\text{H}_2\text{O}$  (liq.)  $= \text{LiOH}$  (200) +  $\frac{1}{2} \text{H}_2$  (g), the following values for  $Q$ : 49.11, 53.09, 52.6, and 52.73. The value of Moers is taken as the best one, whence for  $\text{LiOH}$  (200),  $Q_f = 121.10$ . The existing data on the heat of dilution of aqueous  $\text{LiOH}$  (de Forcrand,<sup>10, 48</sup> Richards and Rowe<sup>2</sup>) were reviewed by Rossini,<sup>3</sup> who gave values from  $\infty$  to 25  $\text{H}_2\text{O}$ .

$\text{Li}^+$  ( $\infty$ ). The foregoing data give, for  $\text{Li}^+$  ( $\infty$ ) +  $\text{OH}^-$  ( $\infty$ ),  $Q_f = 121.288$ , whence, for  $\text{Li}^+$  ( $\infty$ ),  $Q_f = 66.628$ .

$\text{LiOH}$  (c). de Forcrand<sup>44</sup> measured the heat of solution of  $\text{LiOH}$  (c) in  $\text{HCl}$  (220), and later (de Forcrand<sup>47</sup>) its heat of solution in  $\text{H}_2\text{O}$ . His data yield, respectively, for  $Q_f$ , 116.58 and 116.52. The average value, 116.55, gives  $S = 4.55_{200}$ . Truchot<sup>2</sup> found  $S = 5.82_{400}$ . See also Johnston.<sup>4</sup>

$\text{LiOH} \cdot n\text{H}_2\text{O}$  (c). de Forcrand<sup>50</sup> measured the heat of solution of  $\text{LiOH} \cdot \frac{1}{3}\text{H}_2\text{O}$  (c) and also (de Forcrand<sup>44</sup>) that of  $\text{LiOH} \cdot \text{H}_2\text{O}$  (c).

$\text{Li}_2\text{O}$  (c). de Forcrand<sup>45</sup> measured the heat of solution in water. See also Beketoff.<sup>2</sup>

$\text{Li}_2\text{O} \cdot \frac{3}{4}\text{H}_2\text{O}$  (c). de Forcrand<sup>50</sup> measured the heat of solution in water.

$\text{Li}_2\text{O}_2$  (aq.). de Forcrand<sup>31</sup> measured the heat of reaction of  $\text{HCl}$  (aq.) with  $\text{Li}_2\text{O}_2$  (aq.), and of  $\text{LiOH}$  (aq.) with  $\text{H}_2\text{O}_2$  (aq.). His data yield, respectively,  $Q_f = 159.5$  and  $157.7$ .

$\text{Li}_2\text{O}_2$  (c). de Forcrand<sup>31</sup> measured the heat of solution in water.

$\text{LiH}$  (c). The heat of formation of  $\text{LiH}$  can be computed from the difference in the heats of solution of  $\text{Li}$  (c) and  $\text{LiH}$  (c). The recalculated data of Guntz<sup>13</sup> and Moers<sup>1</sup> yield almost identical values:  $Q_f = 21.60$  and  $21.59$ , respectively.

$\text{LiH}$  (g). The dissociation pressure data of Hüttig and Krajewski,<sup>1</sup> Guntz,<sup>13</sup> and Ephraim and Michel<sup>1</sup> yield no reliable thermal values. Mulliken<sup>6</sup> reported 2.47 volt-electrons for the energy of dissociation of gaseous normal  $\text{LiH}$  into gaseous normal  $\text{Li}$  and  $\text{H}$  atoms.

The values for the energy states of gaseous  $\text{LiH}$  are from Mulliken.<sup>6</sup> See also Watson,<sup>2</sup> Nakamura,<sup>1</sup> and Jevons.<sup>1</sup>

$\text{Li}_2\text{O}_2 \cdot \text{H}_2\text{O}_2 \cdot 3\text{H}_2\text{O}$  (c). de Forcrand<sup>31</sup> measured the heat of solution of this compound in water to be  $-4.5$ .

$\text{LiF}$  (aq.). Petersen<sup>3</sup> measured the heat of neutralization of  $\text{HF}$  (200) and  $\text{LiOH}$  (200). His data yield, for  $\text{LiF}$  (400),  $Q_f = 144.69$ .

Lange and Leighton<sup>2</sup> (see Robinson<sup>1</sup>) gave values for the heat of dilution of  $\text{LiF}$  (aq.) at  $25^\circ$ , and their data have been used to obtain values at  $18^\circ$  from  $\infty$  to  $100\text{H}_2\text{O}$ .

$\text{LiHF}_2$  (aq.). Petersen<sup>3</sup> found, for  $2\text{HF}$  (100) +  $\text{LiOH}$  (200) =  $\text{LiHF}_2$  (401) +  $\text{H}_2\text{O}$  (liq.),  $Q = 16.35$ ; whence, for  $\text{LiHF}_2$  (400),  $Q_f = 220.20$ .

$\text{LiF}$  (c). de Forcrand<sup>12</sup> measured the heat of solution.

$\text{LiF}$  (liq.),  $\text{LiF}$  (g). Vapor pressure data were given by Ruff, Schmidt, and Mugdan,<sup>1</sup> and von Wartenberg and Schulz.<sup>1</sup> The latter investigators estimated  $F = -6.0$ . Taking  $V = -52^{1600}$ , we have computed, for  $\text{LiF}$  (c) =  $\text{LiF}$  (g),  $Q = -63$ .

$\text{LiCl}$  (aq.). The heat of neutralization of  $\text{HCl}$  (aq.) with  $\text{LiOH}$  (aq.) was measured by Thomsen,<sup>15</sup> Muller,<sup>1</sup> and Richards and Rowe.<sup>3</sup> The most accurate data are those of Richards and Rowe, and these have been recomputed by Rossini,<sup>6</sup> who gave  $N = 14.077_{201}$ . The data on the heat of dilution of  $\text{LiCl}$  (aq.) (Dunnington and Hoggard,<sup>1</sup> Lemoine,<sup>2</sup> Tucker,<sup>1</sup> Richards and Rowe<sup>2</sup>) were reviewed by Rossini,<sup>5</sup> who gave values from  $\infty$  to  $25\text{H}_2\text{O}$ . Lange and Dürr<sup>2</sup> gave values at  $25^\circ$  for the heat of dilution to  $3\text{H}_2\text{O}$ , and Lemoine,<sup>2</sup> at  $10^\circ$ , to  $4.63\text{H}_2\text{O}$ . These data have been converted to  $18^\circ$  and used to obtain values from  $25$  to  $3\text{H}_2\text{O}$ .

$\text{LiCl}$  (c). The existing data on the heat of solution of  $\text{LiCl}$  have been recomputed to give the following values for  $S_{200}$ : Thomsen,<sup>15</sup>  $8.432$ ;

Pickering,<sup>8</sup> 8.100; Bonnefoi,<sup>1</sup> 8.50; Haigh,<sup>1</sup> 8.349; Lange and Dürr,<sup>2</sup> 8.480; Maier<sup>2</sup> (see Slonim and Hüttig<sup>1</sup>), 8.33; Wasserman,<sup>1</sup> 8.544. The average of the values of Thomsen, Bonnefoi, Lange and Dürr, and Wasserman give  $8.49 \pm 0.03$ .

**LiCl (liq.).** Zemczuzny<sup>1</sup> calculated  $F = -3.7^{613}$  from the freezing point depression. von Wartenberg and Schulz<sup>1</sup> estimated  $F = -5.0$ .

**LiCl (g).** The vapor pressure data of Ruff and Mugdan<sup>1</sup> and von Wartenberg and Schulz<sup>1</sup> yield  $V = -37.3^{1200}$ . Visser<sup>1</sup> interpreted the spectral fluorescent limit as dissociation, obtaining  $D^z = -97$ .

**LiCl(CH<sub>3</sub>OH), LiCl(C<sub>2</sub>H<sub>5</sub>OH).** Lemoine<sup>2</sup> measured the heat of solution of LiCl (c) in various amounts of methyl alcohol at 18°, and of ethyl alcohol at 12°.

**LiClO (aq.).** Neumann and Müller<sup>2</sup> measured the heat of reaction of Cl<sub>2</sub> (g) with LiOH (aq.), and of LiOH (aq.) with HClO (aq.). Their data yield, respectively,  $Q_f = 91.98$  and  $92.63$ , for LiClO (aq.).

**LiCl · nH<sub>2</sub>O (c).** Bogorodskii<sup>1</sup> measured the heats of solution of the mono- and dihydrates. Maier<sup>2</sup> (see Slonim and Hüttig<sup>1</sup>) measured the heat of solution of the monohydrate. Hüttig and Reuscher<sup>1</sup> measured the temperature coefficient of the dissociation pressures of the mono-, di-, and trihydrates.

**LiBr (aq.).** The heat of neutralization of HBr (aq.) with LiOH (aq.) was measured by Richards and Rowe.<sup>3</sup> Their data have been recomputed, giving  $N = 14.040_{201}$ . The heat of dilution of LiBr (aq.) at 25° was measured by Lange and Messner<sup>2</sup> in the very dilute region, and by Lange and Schwartz<sup>1</sup> in the concentrated range. Their data have been converted to 18° to give values from  $\infty$  to 3 H<sub>2</sub>O.

**LiBr (c).** The data on the heat of solution of LiBr (c) have been recomputed to give the following values for  $S_{200}$ : Bodisko,<sup>2</sup> 11.39; Lange and Schwartz,<sup>1</sup> 11.37; Maier<sup>2</sup> (see Slonim and Hüttig<sup>1</sup>), 11.51.

**LiBr (liq.).** We have estimated the heat of fusion.

**LiBr (g).** The vapor pressure data of Ruff and Mugdan<sup>1</sup> and von Wartenberg<sup>1</sup> yield  $V = -36.5^{1200}$ . Visser,<sup>1</sup> from the spectral fluorescent limit, computed  $D^z = -78.4$ .

**LiBr · nH<sub>2</sub>O (c).** Maier<sup>2</sup> (see Slonim and Hüttig<sup>1</sup>) measured the heats of solution of the mono- and dihydrates. Hüttig and Reuscher<sup>1</sup> measured the temperature coefficient of the dissociation pressures of the mono-, di-, and trihydrates.

**LiI (aq.).** The accurate data of Richards and Rowe<sup>3</sup> have been recomputed, giving  $N = 13.972_{201}$ , whence, for LiI (200),  $Q_f = 79.907$ . From  $\text{Li}^+(\infty) + \text{I}^-(\infty)$ , one obtains, for LiI ( $\infty$ ),  $Q_f = 79.998$ . Using these two values, and extrapolating the series of curves representing the heats of dilution of LiF, LiCl, and LiBr, we have computed values of the heat of dilution of LiI (aq.) from  $\infty$  to 100 H<sub>2</sub>O.

**LiI (c).** The data on the heat of solution of the LiI (c) have been recomputed to give the following values for  $S_{200}$ : Bodisko,<sup>1</sup> 14.83; Maier<sup>2</sup> (see Slonim and Hüttig<sup>1</sup>), 14.80; Mosnier,<sup>1</sup> 14.93. We have selected

14.83 as the best value, whence, for  $\text{LiI}$  (c),  $Q_f = 65.08$ . Beketoff<sup>8</sup> measured the heats of solution of  $\text{LiCl}$  (c) +  $\text{NaI}$  (c),  $\text{LiI}$  (c) +  $\text{NaCl}$  (c),  $\text{LiCl}$  (c) +  $\text{KI}$  (c), and  $\text{LiI}$  (c) +  $\text{KCl}$  (c). From his data one finds, for  $\text{LiI}$  (c),  $Q_f = 65.15$  and  $65.10$ , respectively.

$\text{LiI}$  (liq.). We have estimated the heat of fusion.

$\text{LiI}$  (g). The vapor pressure data of Ruff and Mugdan<sup>1</sup> yield  $V = -34.3^{1000}$ .

$\text{LiI} \cdot n\text{H}_2\text{O}$  (c). Maier<sup>2</sup> (see Slonim and Hüttig<sup>1</sup>) measured the heats of solution of the mono-, di-, and trihydrates. Hüttig and Pohle<sup>1</sup> measured the temperature coefficient of the dissociation pressures of the hemi-, mono-, di-, and trihydrates.

$\text{Li}_2\text{SO}_4$  (aq.). Thomsen<sup>15</sup> measured the heat of neutralization of  $\text{LiOH}$  (200) with  $\text{H}_2\text{SO}_4$  (400). Zukowsky<sup>1</sup> measured the heat of solution of  $\text{Li}$  (c) in  $\text{H}_2\text{SO}_4$  (626). Thomsen's<sup>15</sup> data yield  $N = 31.27_{802}$ , whence, for  $\text{Li}_2\text{SO}_4$  (800),  $Q_f = 348.57$  and for  $\text{Li}_2\text{SO}_4$  ( $\infty$ ),  $Q_f = 348.97$ ; whereas, from  $2\text{Li}^+(\infty) + \text{SO}_4^{--}(\infty)$ , one finds 349.056. The heat of dilution of  $\text{Li}_2\text{SO}_4$  (aq.) was measured in the very dilute range by Lange and Streeck,<sup>1</sup> whose data have been used to obtain values at  $18^\circ$  from  $\infty$  to 200  $\text{H}_2\text{O}$ .

$\text{Li}_2\text{SO}_4$  (c, II). The existing data yield the following values for  $S_{200}$ : Thomsen,<sup>15</sup> 5.96; Pickering<sup>2</sup>,<sup>3</sup> 6.18.

$\text{Li}_2\text{SO}_4$  (c, I). Hare<sup>1</sup> measured the heat of transition.

$\text{Li}_2\text{SO}_4 \cdot \text{H}_2\text{O}$  (c). The existing data have been recomputed to give the following for  $S_{400}$ : Thomsen,<sup>15</sup> 3.41; Pickering,<sup>3</sup> 3.26.

$\text{LiI} \cdot n\text{SO}_2$  (c). Ephraim and Kornblum<sup>1</sup> measured the temperature coefficient of the dissociation pressures of  $\text{LiI} \cdot \text{SO}_2$  (c) and  $\text{LiI} \cdot 2\text{SO}_2$  (c).

$\text{Li}_2\text{Se}$  (aq.). Fabre<sup>1</sup> measured the heat of neutralization of  $\text{LiOH}$  (220) with  $\text{H}_2\text{Se}$  (g). His data yield, for  $\text{Li}_2\text{Se}$  (440),  $Q_f = 95.3$ .

$\text{Li}_2\text{Se} \cdot n\text{H}_2\text{O}$  (c). Fabre<sup>1</sup> measured the heats of solution of  $\text{Li}_2\text{Se}$  (c) and  $\text{Li}_2\text{Se} \cdot 9\text{H}_2\text{O}$  (c).

$\text{Li}_3\text{N}$  (c). Guntz<sup>14</sup> measured the heat of solution.

$\text{LiNO}_3$  (aq.). The recomputed (see Rossini<sup>6</sup>) data of Richards and Rowe<sup>3</sup> give  $N = 13.931_{201}$ . The heat of dilution data of Richards and Rowe,<sup>2</sup> 25 to 400  $\text{H}_2\text{O}$ , were extrapolated to  $\infty$   $\text{H}_2\text{O}$  by Rossini,<sup>5</sup> and we have extrapolated in the concentrated region to 3  $\text{H}_2\text{O}$ .

$\text{LiNO}_3$  (c). The data on the heat of solution of  $\text{LiNO}_3$  (c) have been recomputed to give the following values for  $S_{200}$ : Thomsen,<sup>15</sup> 0.273; Berthelot, 0.331; Pickering,<sup>8</sup> 0.329; Haigh,<sup>1</sup> 0.340.

$\text{LiNO}_3$  (liq.). Goodwin and Kalmus<sup>1</sup> measured the heat of fusion.

$\text{LiNO}_3 \cdot 3\text{H}_2\text{O}$  (c). Morgan and Benson<sup>1</sup> found, from measurement of the constant of the freezing point lowering,  $F^{29.9} = -8.7$ . This gives, at  $18^\circ$ ,  $F = -8.4$ , which is equivalent to  $S_3$ .

$\text{LiNO}_3(\text{C}_2\text{H}_5\text{OH})$ . Pickering<sup>8</sup> measured the heat of solution of  $\text{LiNO}_3$  (c) in ethyl alcohol.

$\text{LiNH}_2$  (c). Guntz and Benoit<sup>1</sup> measured the heat of solution in  $\text{HCl}$  (aq.).

$\text{Li}(\text{NH}_3)_4$  (liq.). Kraus<sup>1</sup> and Benoit<sup>1</sup> measured the temperature coefficient of the dissociation pressure.

$\text{Li}_2\text{NH}$  (c). Guntz and Benoit<sup>1</sup> measured the heat of solution in  $\text{HCl}$  (aq.).

$\text{Li}_2\text{C}_2$  (c). The heat of solution in water was measured by Guntz.<sup>15</sup>

$\text{Li}_2\text{CO}_3$  (aq.). Muller<sup>1</sup> measured the heat of reaction between  $2\text{HCl}$ (90) and  $\text{Li}_2\text{CO}_3$ (1800); de Forcrand<sup>49</sup> that between  $2\text{LiOH}$ (100) and  $\text{CO}_2$ (1800). Their data yield, respectively, for  $\text{Li}_2\text{CO}_3$ (2000),  $Q_f = 293.31$  and  $293.27$ .

$\text{LiHCO}_3$  (aq.). Muller<sup>1</sup> measured the heat of reaction between  $2\text{HCl}$ (90) and  $2\text{LiHCO}_3$ (980). Combination of these data with his values for the reaction between  $2\text{HCl}$ (90) and  $\text{Li}_2\text{CO}_3$ (1800), gives, for the heat of reaction between  $\text{Li}_2\text{CO}_3$ (1800) and  $\text{H}_2\text{CO}_3$ (2000) to form  $2\text{LiHCO}_3$ (1000),  $Q = 1.93$ . Using, for  $\text{Li}_2\text{CO}_3$ (1800),  $Q_f$  from Muller's data, gives, for  $\text{LiHCO}_3$ (1900),  $Q_f = 231.38$ .

$\text{Li}_2\text{CO}_3$  (c). de Forcrand<sup>49</sup> measured the heat of solution in water.

$\text{LiCH}_3\text{O}$ (60  $\text{CH}_3\text{OH}$ ). de Forcrand<sup>16</sup> measured the heat of solution of  $\text{Li}$  (c) in methyl alcohol.

$\text{LiC}_2\text{H}_3\text{O}_2 \cdot n\text{H}_2\text{O}$  (c). The vapor pressure of the hydrates was measured at various temperatures by Lescoeur.<sup>6</sup>

$\text{LiC}_2\text{H}_5\text{O}$ (60  $\text{C}_2\text{H}_5\text{OH}$ ). de Forcrand<sup>16</sup> measured the heat of solution of  $\text{Li}$  (c) in ethyl alcohol.

$\text{LiCN}$  (aq.). Varet<sup>3</sup> measured the heat of neutralization of  $\text{LiOH}$  (110) with  $\text{HCN}$ (110).

$\text{Li}_2\text{SiO}_3$  (gls.). Tschernobaeff<sup>1</sup> measured the heat of reaction between  $\text{SiO}_2$  and  $\text{Li}_2\text{CO}_3$  in a bomb using carbon as the auxiliary combustible material.

$\text{Li}_2\text{SiF}_6$  (aq.). Truchot<sup>2</sup> measured the heat of reaction between  $\text{SiF}_4$  (g) and  $2\text{LiF}$  (c), and between  $\text{H}_2\text{SiF}_6$  (aq.) and  $2\text{LiOH}$  (aq.). His data yield, respectively, for  $Q_f$ ,  $\text{Li}_2\text{SiF}_6$ (220), 676.9, and  $\text{Li}_2\text{SiF}_6$ (1320), 680.9.

$\text{Li}_2\text{SiF}_6$  (c). Truchot<sup>2</sup> measured the heat of solution.

$2\text{LiI} \cdot \text{PbI}_2 \cdot n\text{H}_2\text{O}$  (c). Mosnier<sup>1</sup> measured the heats of solution of the anhydrous salt and the tetrahydrate.

$n\text{LiCl} \cdot \text{ThCl}_4 \cdot m\text{H}_2\text{O}$  (c). Chauvenet<sup>2</sup> measured the heats of solution of  $\text{LiCl} \cdot \text{ThCl}_4 \cdot 8\text{H}_2\text{O}$  (c) and of  $2\text{LiCl} \cdot \text{ThCl}_4$  (c).

$\text{LiHg}_{99}$  (liq.). Lewis and Keyes<sup>2</sup> computed the partial molal heat of solution of  $\text{Li}$  (c) in  $\text{LiHg}_{99}$  (liq.) from the temperature coefficient of the electromotive force of cells.

$\text{LiHg}_x$  (c). Zukowsky<sup>1</sup> measured the heat of solution of  $\text{Li}$  and its solid amalgams in  $\text{H}_2\text{SO}_4$  (aq.).

$n\text{LiBr} \cdot \text{HgBr}_2$  (aq.). Varet<sup>6</sup> measured the heat of mixing, in various proportions, of  $\text{LiBr}$  (aq.) with  $\text{HgBr}_2$  (aq.).

$n\text{LiCN} \cdot \text{Hg}(\text{CN})_2$  (aq.). Varet<sup>2</sup> measured the heat of mixing of  $\text{LiCN}$  (aq.) with  $\text{Hg}(\text{CN})_2$  (aq.).

$n\text{LiX} \cdot \text{Hg}(\text{CN})_2 (\text{aq.})$ . Varet<sup>2</sup> measured the heat of mixing of  $\text{LiCl} (\text{aq.})$  with  $\text{Hg}(\text{CN})_2 (\text{aq.})$ ,  $\text{LiBr} (\text{aq.})$  with  $\text{Hg}(\text{CN})_2 (\text{aq.})$ , and  $\text{LiI} (\text{aq.})$  with  $\text{Hg}(\text{CN})_2 (\text{aq.})$ .

$\text{LiX} \cdot \text{Hg}(\text{CN})_2 \cdot 3\frac{1}{2} \text{H}_2\text{O} (\text{c.})$ . Varet<sup>2</sup> measured the heats of solution of the bromide and the iodide.

$\text{LiX} \cdot n\text{NH}_3 (\text{c.})$ . Bonnefoi<sup>1</sup> measured the heats of solution of the mono-, di-, tri-, and tetrammines of  $\text{LiCl}$  and  $\text{LiBr}$ , and also the temperature coefficient of their dissociation pressures. Biltz and Hansen<sup>1</sup> measured the temperature coefficient of the dissociation pressures of the amines of  $\text{LiCl}$  containing 4 and 5 moles of  $\text{NH}_3$ ; and of  $\text{LiI}$  with 1, 2, 3, 4, 5, and  $6\frac{1}{2}$  moles of  $\text{NH}_3$ ; and of  $\text{LiI}$  with 1, 2, 3, 4, 5,  $5\frac{1}{2}$ , and 7 moles of  $\text{NH}_3$ . Ephraim<sup>5</sup> obtained similar but discordant data on  $\text{LiI} \cdot 4\text{NH}_3 (\text{c.})$ .

$\text{LiX} \cdot n\text{CH}_3\text{NH}_2 (\text{c.})$ ,  $\text{LiX} \cdot n(\text{CH}_3)_2\text{NH} (\text{c.})$ ,  $\text{LiX} \cdot n\text{C}_2\text{H}_5\text{NH}_2 (\text{c.})$ . Bonnefoi<sup>1</sup> measured the heats of solution of  $\text{LiCl} \cdot n\text{CH}_3\text{NH}_2 (\text{c.})$  with 1, 2, and 3 moles of  $\text{CH}_3\text{NH}_2$ , of  $\text{LiCl} \cdot (\text{CH}_3)_2\text{NH} (\text{c.})$ , and of  $\text{LiCl} \cdot n\text{C}_2\text{H}_5\text{NH}_2 (\text{c.})$  with 1, 2, and 3 moles of  $\text{C}_2\text{H}_5\text{NH}_2$ , and also obtained data on the temperature coefficient of the dissociation pressures of  $\text{LiCl} \cdot n\text{CH}_3\text{NH}_2 (\text{c.})$  with 1, 2, and 3 moles of  $\text{CH}_3\text{NH}_2$ , and of  $\text{LiCl} \cdot n\text{C}_2\text{H}_5\text{NH}_2 (\text{c.})$ , with 1, 2, and 3 moles of  $\text{C}_2\text{H}_5\text{NH}_2$ . Simon and Glauner<sup>1</sup> measured, at various temperatures, the dissociation pressures of  $\text{LiCl} \cdot n\text{CH}_3\text{NH}_2 (\text{c.})$  with 1, 2, 3, and 4 moles of  $\text{CH}_3\text{NH}_2$ , of  $\text{LiBr} \cdot n\text{CH}_3\text{NH}_2 (\text{c.})$  with 1, 2, 3, 4, and 5 moles of  $\text{CH}_3\text{NH}_2$ , of  $\text{LiI} \cdot n\text{CH}_3\text{NH}_2 (\text{c.})$  with 1, 2, 3, and  $3\frac{1}{2}$  moles of  $\text{CH}_3\text{NH}_2$ , of  $\text{LiCl} \cdot n(\text{CH}_3)_2\text{NH} (\text{c.})$  with 1, 2, and 3 moles  $(\text{CH}_3)_2\text{NH}$ , of  $\text{LiBr} \cdot n(\text{CH}_3)_2\text{NH} (\text{c.})$  with  $\frac{1}{2}$ , 1, 2, 3, 4, and 5 moles of  $(\text{CH}_3)_2\text{NH}$ , and of  $\text{LiI} \cdot n(\text{CH}_3)_2\text{NH} (\text{c.})$  with  $\frac{1}{2}$ , 1,  $1\frac{1}{2}$ , 2, 3, and 5 moles of  $(\text{CH}_3)_2\text{NH}$ .

## SODIUM

**Na (c).** Standard state.

**Na (liq.).** The data on the heat of fusion are: Griffiths,<sup>1</sup>  $-0.634$ ; Rengade,<sup>5</sup>  $-0.627$ ; Iitaka,<sup>1</sup>  $-0.598$ ; Joannis,<sup>2</sup>  $-0.73$ ; Bernini,<sup>1, 2, 3</sup>  $-0.41$ ; Bridgman,<sup>2</sup>  $-0.69$ .

**Na (g).** We have calculated the heat of sublimation of sodium to form the monatomic gas from the vapor pressure-temperature data, taking due account of the appreciable amount of  $\text{Na}_2$  molecules contained in the actual vapor at equilibrium. The vapor pressure data used are those of Edmonson and Egerton,<sup>1, 2</sup> Rodebush and Walters,<sup>1</sup> Rodebush,<sup>2</sup> Rodebush and de Vries,<sup>1</sup> Rodebush and Henry,<sup>1</sup> Haber and Zisch,<sup>1</sup> Ladenberg and Minkowski,<sup>1</sup> and Gibhart.<sup>1</sup> See also Kroner,<sup>1</sup> Hackspill,<sup>1</sup> van Laar,<sup>9</sup> and Simon and Zeidler.<sup>1</sup> Our value for the heat of sublimation,  $\text{Na} (\text{c}) = \text{Na} (\text{g})$ , is  $-25.9$  at  $18^\circ$ . Sherman<sup>1</sup> calculated  $-25.8$ .

The values for the energy states of the sodium atom are taken from Fowler,<sup>3</sup> Bacher and Goudsmit,<sup>1</sup> and Sodergvist.<sup>1</sup>

**$\text{Na}_2 (\text{g})$ .** Loomis and Nusbaum<sup>3</sup> and Nusbaum and Loomis<sup>1</sup> reported the energy of dissociation,  $\text{Na}_2 (\text{g}) = 2 \text{Na} (\text{g})$ , with each substance in its normal state, to be  $0.76 \pm 0.02$  volt-electrons. The values for the energy

states of gaseous diatomic sodium are from Mulliken,<sup>6</sup> Loomis,<sup>1</sup> Loomis and Wood,<sup>1</sup> Fredrichson and Watson,<sup>1</sup> Fredrichson,<sup>1</sup> Wiezel and Kulp,<sup>1</sup> and Kimura and Uchida.<sup>1</sup>

**NaOH (aq.).** The heat of solution of Na (c) in water was measured by Thomsen,<sup>15</sup> Joannis,<sup>2</sup> Rengade,<sup>1</sup> and Hagen and Sieverts.<sup>1</sup> Their recomputed data give, respectively, for  $\text{Na (c)} + \text{H}_2\text{O (liq.)} = \text{NaOH (200)} + \frac{1}{2} \text{H}_2 \text{ (g)}$ , the following values, for  $Q$ :  $43.56 \pm 0.02$ ,  $43.08 \pm 0.20$ ,  $44.00 \pm 0.23$ , and  $44.42 \pm 0.21$ . Selecting 43.7 as the best value, we have obtained, for NaOH(100),  $Q_f = 112.1$ . The existing data on the heat of dilution of NaOH (aq.) from 25 to 3200  $\text{H}_2\text{O}$  (Richards and Rowe,<sup>2</sup> Pratt,<sup>1</sup> Richards and Gucker<sup>1</sup>) were reviewed by Rossini,<sup>5</sup> who gave values from 25 to  $\infty$   $\text{H}_2\text{O}$ . For the concentrated region, the data of Thomsen,<sup>15</sup> Berthelot,<sup>20</sup> Sabatier,<sup>1</sup> de Forcrand,<sup>35</sup> Richards and Rowe,<sup>2</sup> and Richards and Hall<sup>2</sup> have been utilized to obtain values from 25 to 3  $\text{H}_2\text{O}$ .

**$\text{Na}^+(\infty)$ .** The foregoing data give, for  $\text{Na}^+(\infty) + \text{OH}^-(\infty)$ ,  $Q_f = 112.139$ ; whence, for  $\text{Na}^+(\infty)$ ,  $Q_f = 57.479$ . Allmand and Pollock,<sup>1</sup> from measurements of the electromotive force of cells at various temperatures, found, for  $\text{Na (c)} + \text{HgCl (c)} = \text{NaCl (c)} + \text{Hg (liq.)}$ ,  $Q = 66.74$ . Using our values for the heats of formation of HgCl (c) and  $\text{Cl}^-(\infty)$ , and the heat of solution and dilution of NaCl, these data give, for  $\text{Na}^+(\infty)$ ,  $Q_f = 57.48$ .

**NaOH (c, II).** The data on the heat of solution of NaOH (c, II) yield the following values for  $S_{200}$ : Thomsen,<sup>15</sup> 9.96; Berthelot,<sup>20</sup> 10.01; de Forcrand,<sup>35</sup> 10.18.

**$\text{NaOH} \cdot n\text{H}_2\text{O (c)}$ .** de Forcrand<sup>35</sup> measured the heats of solution of  $\text{NaOH} \cdot \frac{1}{2} \text{H}_2\text{O (c)}$ ,  $\text{NaOH} \cdot \frac{2}{3} \text{H}_2\text{O (c)}$ ,  $\text{NaOH} \cdot \frac{3}{4} \text{H}_2\text{O (c)}$ , and  $\text{NaOH} \cdot \text{H}_2\text{O (c)}$ ; Berthelot<sup>20</sup> that of  $\text{NaOH} \cdot 0.76 \text{H}_2\text{O (c)}$ ; and Pickering<sup>12</sup> that of  $\text{NaOH} \cdot \text{H}_2\text{O (c)}$ . The values calculated from the data of de Forcrand are taken as the best. For  $\text{NaOH} \cdot \text{H}_2\text{O (c)}$ , the following values for  $S_{200}$  were computed: de Forcrand,<sup>35</sup> 5.09; Pickering,<sup>12</sup> 5.08. See also Shibata.<sup>1</sup>

**NaOH (c, I).** Hevesy<sup>1</sup> measured the heat of transition.

**$\text{Na}_2\text{O (c)}$ .** The data of Rengade<sup>3</sup> and Matsiu and Nakata<sup>1</sup> yield, respectively, for  $S_{200}$ , 56.48 and 56.20. We have taken the average as the best value. Beketoff<sup>1</sup> found  $S = 55$  to 56.

**$\text{Na}_3\text{O (c)}$ .** de Forcrand<sup>25</sup> measured the heat of solution.

**$\text{Na}_2\text{O}_2 \text{ (c)}$ .** de Forcrand<sup>25</sup> measured the heat of solution in HCl (aq.).

**$\text{NaHO}_2 \text{ (aq.)}$ .** Joyner<sup>1</sup> measured the heat of mixing  $\text{NaHO}_2 \text{ (aq.)}$  with  $\text{HNO}_3 \text{ (aq.)}$

**NaH (c).** de Forcrand<sup>43</sup> measured the heat of solution of NaH (c). Hagen and Sieverts<sup>1</sup> measured the heats of solution of Na (c) and of NaH (c). These data yield, respectively, for NaH (c),  $Q_f = 17.9$ , and  $12.7 \pm 0.3$ . The dissociation pressure data of Keyes<sup>1</sup> yield  $Q_f = 14.4$ . From the dissociation pressure data of Troost and Hautefeuille,<sup>8</sup> Moutier<sup>1</sup> calculated  $Q_f = 13$ . See also Zhukov.<sup>2</sup>

**NaH (g).** The value for the energy of dissociation of normal gaseous NaH into normal gaseous Na and H atoms is from Hori.<sup>6</sup> See also Mulli-

ken.<sup>6</sup> The values for the energy states of gaseous NaH are from Hori.<sup>6</sup> See also Mulliken<sup>6</sup> and Jevons.<sup>1</sup>

**NaF (aq.).** Thomsen<sup>15</sup> and Mulert<sup>1</sup> measured the heat of neutralization of HF (aq.) with NaOH (aq.). Their data yield respectively: NaF (400),  $Q_f = 135.50$ ; NaF (70),  $Q_f = 138.1$ . We have selected Thomsen's value, since it gives a more concordant value for  $F^-(\infty)$ . We have estimated the heat of dilution of NaF (aq.) in the range 100 to  $\infty$  H<sub>2</sub>O.

**NaF (c).** The heat of solution was measured by Guntz.<sup>1</sup>

**NaF (liq.).** Plato<sup>2</sup> measured the heat of fusion.

**NaF (g).** The vapor pressure data of von Wartenberg and Schulz<sup>1</sup> and Ruff, Schmidt, and Mugdan<sup>1</sup> yield  $V = -57^{1300}$ .

**NaHF<sub>2</sub> (aq.).** Thomsen<sup>15</sup> measured the heat of mixing NaF(200) with HF(200).

**NaHF<sub>2</sub> (c).** The data of Guntz<sup>1</sup> and de Forcrand<sup>60</sup> yield identical values for  $S_{400}$ .

**NaCl (aq.).** The heat of neutralization of NaOH (aq.) with HCl (aq.) was measured by Hess,<sup>5</sup> Andrews,<sup>2, 7, 11</sup> Favre and Silbermann,<sup>3</sup> Favre,<sup>3</sup> Berthelot,<sup>4</sup> Thomsen,<sup>15</sup> Muller,<sup>1</sup> von Steinwehr,<sup>1</sup> Mathews,<sup>1</sup> Mathews and Germann,<sup>1</sup> Ellingson,<sup>1</sup> Keyes, Gillespie, and Mitsukuri,<sup>1</sup> Richards and Rowe,<sup>3</sup> and Gillespie, Lambert, and Gibson.<sup>1</sup> The data of the last two named investigations were recomputed by Rossini,<sup>6</sup> giving  $N = 13.996_{201}$ . Biltz and Haase<sup>1</sup> measured the heat of solution of Na (c) in excess HCl(8). The data on the heat of dilution of NaCl (aq.) from 25 to  $\infty$  H<sub>2</sub>O, (Pratt,<sup>1</sup> Richards and Rowe,<sup>2</sup> Lange and Messner,<sup>2</sup> Lange and Robinson,<sup>1</sup> Thomsen,<sup>15</sup> van Deventer and van der Stadt,<sup>1</sup> Laksonen,<sup>2</sup> Backlung,<sup>1</sup> Magie,<sup>1</sup> Stearn and Smith<sup>1</sup>) were reviewed by Rossini,<sup>5</sup> who gave values from  $\infty$  to 25 H<sub>2</sub>O. For the concentrated region, the data of Wust and Lange,<sup>2</sup> Lipsett, Johnson, and Maass,<sup>1</sup> Randall and Bisson,<sup>1</sup> Stackelberg,<sup>1</sup> Sandonnini and Gerosa,<sup>1</sup> Scholz,<sup>1</sup> Laksonen,<sup>2</sup> and Allmand and Pollock<sup>1</sup> have been utilized to obtain values from 25 to 10 H<sub>2</sub>O.

**NaCl (c).** The existing data on the heat of solution have been recomputed to give the following values for  $S_{200}$ : Winkelmann,<sup>1</sup>  $-1.14$ ; Berthelot,<sup>10</sup>  $-1.18$ ; Ostwald,<sup>2</sup>  $-1.235$ ; Berthelot and Ilosvay,<sup>1</sup>  $-1.153$ ; Thomsen,<sup>15</sup>  $-1.185$ ; Pickering,<sup>7</sup>  $-1.210$ ; Scholz,<sup>1</sup>  $-1.31$ ; Varet,<sup>2</sup>  $-1.27$ ; Stackelberg,<sup>1</sup>  $-1.106$ ; Varali-Thevenet,<sup>1</sup>  $-1.225$ ; Brönsted,<sup>4</sup>  $-1.164$ ; Zemczuzny and Rambach,<sup>1</sup>  $-1.22$ ; Randall and Bisson,<sup>1</sup>  $-1.219$ ; Laksonen,<sup>2</sup>  $-1.255$ ; Sandonnini and Gerosa,<sup>1</sup>  $-1.240$ ; Wust and Lange,<sup>2</sup>  $-1.210$ ; Lipsett, Johnson, and Maass,<sup>1</sup>  $-1.206$ ; and Cohen and Kooy,<sup>1</sup>  $-1.203$ . We have taken the average of the values of Randall and Bisson,  $-1.219$ , Wust and Lange,  $-1.210$ , Lipsett, Johnson, and Maass,  $-1.206$ , and Cohen and Kooy,  $-1.203$ , obtaining  $-1.210 \pm 0.005$ .

**NaCl (liq.).** The data on the heat of fusion of sodium chloride at its melting point are: Plato,<sup>2</sup>  $-7.23$ ; Hare,<sup>1</sup>  $-7.23$ ; Zemczuzny and Rambach,<sup>1</sup>  $-5.7$ ; Roth and Bertram,<sup>1</sup>  $-7.41$ .

**NaCl (g).** Vapor pressure data were given by Fiock and Rodebush,<sup>1</sup> Hackspill and Grandadam,<sup>1</sup> Horiba and Baba,<sup>1</sup> von Wartenberg and

Albrecht,<sup>1</sup> and Ruff and Mugdan.<sup>1</sup> We have selected  $V = -43.5$ ,<sup>1200</sup> whence the heat of sublimation at  $18^\circ$  becomes  $-57.1$ . See also Beutler and Polanyi,<sup>1</sup> Reis,<sup>2</sup> and van Laar.<sup>9</sup>

**NaClO (aq.).** Favre,<sup>1</sup> Berthelot,<sup>151</sup> Thomsen,<sup>15</sup> and Neumann and Müller<sup>2</sup> measured the heat of reaction between  $\text{Cl}_2$  (g) and  $\text{NaOH}$  (aq.). Their data yield, respectively, for  $\text{NaClO}$  (800),  $Q_f = 83, 84, 83.28$ , and  $82.73$ . Thomsen<sup>15</sup> and Neumann and Müller<sup>2</sup> also measured the heat of neutralization of  $\text{NaOH}$  (aq.) with  $\text{HClO}$  (aq.), their data yielding, respectively,  $\text{NaClO}$  (800),  $Q_f = 83.40$ , and  $\text{NaClO}$  (400),  $Q_f = 83.56$ .

**NaClO<sub>3</sub> (aq.).** Thomsen<sup>15</sup> measured the heat of neutralization of  $\text{NaOH}$  (aq.) with  $\text{HClO}_3$  (aq.). His data give, for  $\text{NaClO}_3$  (400),  $Q_f = 78.25$ . The heat of dilution in the very dilute region was measured at  $25^\circ$  by Lange and Robinson.<sup>2</sup> We have converted their data to  $18^\circ$  and extrapolated to  $200 \text{ H}_2\text{O}$ .

**NaClO<sub>3</sub> (c).** The data of Berthelot<sup>2</sup> yield  $S = -5.1_{300}$ , and those of Bronsted,<sup>10</sup>  $S = -5.32_{400}$ , giving  $Q_f = 83.4$  and  $83.57$ , respectively. From electromotive force measurements over a range of temperatures, Bronsted<sup>10</sup> found, for  $\text{KCl}$  (c) +  $\text{NaClO}_3$  (c) =  $\text{KClO}_3$  (c) +  $\text{NaCl}$  (c),  $Q = 1.52$ . Taking the other values as known, we have obtained, for  $\text{NaClO}_3$  (c),  $Q_f = 83.64$ .

**NaClO<sub>4</sub> (aq.).** The data of Berthelot,<sup>79</sup> who measured the heat of neutralization of  $\text{HClO}_4$  (aq.), yield, for  $\text{NaClO}_4$  (660),  $Q_f = 97.53$ . We have estimated the heat of dilution from 400 to  $\infty \text{ H}_2\text{O}$ .

**NaClO<sub>4</sub> (c).** Berthelot<sup>79</sup> measured the heat of solution.

**NaBr (aq.).** The heat of neutralization of  $\text{HBr}$  (aq.) with  $\text{NaOH}$  (aq.) was measured by Berthelot<sup>10</sup> and Richards and Rowe.<sup>3</sup> The latter data have been recomputed to give  $N = 13.923_{201}$ . The heat of dilution of  $\text{NaBr}$  (aq.) was measured by Wust and Lange,<sup>2</sup> Lange and Robinson,<sup>1</sup> van Deventer and van der Stadt,<sup>2</sup> and Dunnington and Hoggard.<sup>1</sup> These data have been utilized to obtain values from  $\infty$  to  $6 \text{ H}_2\text{O}$ .

**NaBr (c).** The data on the heat of solution have been recomputed to give the following values for  $S_{200}$ : Favre and Valson,<sup>2</sup>  $0.0$ ; Berthelot,<sup>10</sup>  $-0.04$ ; Thomsen,<sup>15</sup>  $-0.19$ ; Varet,<sup>2</sup>  $-0.58$ ; Wust and Lange,<sup>2</sup>  $-0.61$ .

**NaBr (liq.).** We have estimated the heat of fusion.

**NaBr (g).** Vapor pressure data were reported by von Wartenberg and Albrecht<sup>1</sup> and Ruff and Mugdan.<sup>1</sup> See also von Wartenberg and Schulz,<sup>1</sup> van Laar,<sup>3</sup> and Beutler and Polanyi.<sup>1</sup> We have calculated  $V = -38.8$ ,<sup>1250</sup> and  $-53.8$  for the heat of sublimation at  $18^\circ$ . Franck, Kuhn, and Rollefson,<sup>1</sup> from the spectral absorption limit, computed  $D^* = -91$ , for  $\text{NaBr}$  (g). See also Visser.<sup>1</sup>

**NaBr · 2 H<sub>2</sub>O (c).** The data on the heat of solution yield the following values for  $S_{200}$ : Favre and Valson,<sup>2</sup>  $-4.9$ ; Berthelot,<sup>10</sup>  $-4.31$ ; Thomsen,<sup>15</sup>  $-4.59$ .

**NaBrO (aq.).** Thomsen<sup>15</sup> measured the heat of reaction of  $\text{Br}_2$  (g) with  $2 \text{ NaOH}$  (400). His data yield for  $\text{NaBrO}$  (aq.),  $Q_f = 78.67$ . Berthelot's<sup>81</sup> data on the same reaction are apparently uncertain.

**NaBrO<sub>3</sub> (aq.).** From the ions, we have obtained for NaBrO<sub>3</sub> (∞),  $Q_f=68.68$ . The data of Lange and Robinson,<sup>2</sup> who measured the heat of dilution in the very dilute range of concentration at 25°, have been converted to 18° and extrapolated to 200 H<sub>2</sub>O.

**NaI (aq.).** The heat of neutralization of HBr (aq.) with NaOH (aq.) was measured by Berthelot<sup>10</sup> and Richards and Rowe.<sup>3</sup> The latter data have been recomputed, giving  $N=13.855_{201}$ . The heat of dilution data of Wust and Lange<sup>2</sup> and Lange and Robinson,<sup>2</sup> at 25°, have been used to obtain values at 18° from ∞ to 5 H<sub>2</sub>O.

**NaI (c).** The heat of solution data yield the following values for  $S_{200}$ : Favre and Valson,<sup>2</sup> 1.7(?); Berthelot,<sup>10</sup> 1.552; Thomsen,<sup>15</sup> 1.147; Pickering,<sup>8</sup> 1.392; Varet,<sup>2</sup> 1.280; Mosnier,<sup>1</sup> 1.40; and Wust and Lange,<sup>2</sup> 1.555.

**NaI (liq.).** We have estimated the heat of fusion.

**NaI (g).** Vapor pressure data were reported by von Wartenberg and Albrecht<sup>1</sup> and Ruff and Mugdan.<sup>1</sup> We have taken  $V=-38.6^{1100}$  and calculated  $-50.4$  for the heat of sublimation at 18°. Sommermeyer<sup>1</sup> calculated, from the spectral absorption limit of sodium iodide vapor,  $D^{\circ}=-70$ .

**NaI · 2 H<sub>2</sub>O (c).** The data on the heat of solution yield the following values for  $S_{200}$ : Favre and Valson,<sup>2</sup>  $-5.7(?)$ ; Berthelot,<sup>10</sup>  $-3.80$ ; and Thomsen,<sup>15</sup>  $-3.98$ .

**NaI(C<sub>2</sub>H<sub>5</sub>OH).** Pickering<sup>8</sup> measured the heat of solution of sodium iodide in ethyl alcohol.

**NaIO<sub>3</sub> (aq.).** From the ions, we have obtained for NaIO<sub>3</sub> (∞),  $Q_f=111.98$ . The heat of dilution was measured at 25° by Lange and Robinson.<sup>2</sup>

**Na<sub>2</sub>S (aq.).** Berthelot<sup>14</sup> measured the heat of neutralization of H<sub>2</sub>S (aq.) with 2 NaOH (aq.); Thomsen<sup>15</sup> and Sabatier,<sup>1</sup> that of H<sub>2</sub>S (g) with 2 NaOH (aq.). Their data yield for Na<sub>2</sub>S(400),  $Q_f=104.98, 105.20$ , and  $104.98$ , respectively. Sabatier<sup>1</sup> also measured the heat of mixing Na<sub>2</sub>S (aq.) with 2 HCl (aq.), and of the reaction of Na<sub>2</sub>S (aq.) with I<sub>2</sub> (s). These latter data yield  $Q_f=105.3$  and  $104.1$ , respectively. Sabatier<sup>1</sup> measured the heat of dilution of Na<sub>2</sub>S (aq.) from 20 to 400 H<sub>2</sub>O. We have estimated the values to infinite dilution.

**Na<sub>2</sub>S (c).** The existing data yield the following values for  $S_{400}$ : Sabatier,<sup>1</sup> 15.19; and Rengade and Costeauun,<sup>1</sup> 15.5(?).

**Na<sub>2</sub>S (liq.).** Friedrich<sup>1</sup> gave  $F=-1.65^{,920}$  from the freezing point lowering constant.

**Na<sub>2</sub>S · nH<sub>2</sub>O (c).** Sabatier<sup>1</sup> measured the heats of solution of the hydrates with  $4\frac{1}{2}$ , 5, and 9 moles of H<sub>2</sub>O.

**NaHS (aq.).** Berthelot<sup>14</sup> measured the heat of reaction of NaOH (110) with H<sub>2</sub>S(880); Thomsen<sup>15</sup> that of NaHS(400) with NaOH(400); Sabatier<sup>1</sup> that of NaHS(1470) with HCl(110). These data yield the following values for NaHS(400): 61.28, 61.49, 61.32, and 61.75. Sabatier<sup>1</sup>

measured the heat of dilution of aqueous NaHS from 4 to 200 H<sub>2</sub>O. We have estimated the values to infinite dilution, assuming no dissociation of HS<sup>-</sup> (aq.).

**NaHS · nH<sub>2</sub>O (c).** Sabatier<sup>1</sup> measured the heats of solution of the anhydrous salt and the dihydrate.

**NaS<sub>n</sub> (aq.).** Sabatier<sup>1</sup> measured the heat of reaction of I<sub>2</sub> with Na<sub>2</sub>S<sub>2</sub> (aq.), Na<sub>2</sub>S<sub>3</sub> (aq.), and Na<sub>2</sub>S<sub>4</sub> (aq.), respectively.

**Na<sub>2</sub>S<sub>4</sub> (c).** Sabatier<sup>1</sup> measured the heat of solution.

**Na<sub>2</sub>SO<sub>3</sub> (aq.).** Thomsen<sup>15</sup> measured the heat of reaction of H<sub>2</sub>SO<sub>3</sub> (400) with 2 NaOH (200); de Forcrand<sup>4</sup> that of H<sub>2</sub>SO<sub>3</sub> (220) with 2 NaOH (150), and of Na<sub>2</sub>SO<sub>3</sub> (550) with 2 HCl (110). These data yield for Na<sub>2</sub>SO<sub>3</sub> (∞), *Qf* = 263.2, 264.2, and 265.1, respectively. We have estimated the heat of dilution.

**Na<sub>2</sub>SO<sub>3</sub> · nH<sub>2</sub>O (c).** de Forcrand<sup>4</sup> measured the heats of solution of the anhydrous salt and the heptahydrate. Ariei,<sup>1</sup> from vapor pressure data, calculated, for Na<sub>2</sub>SO<sub>3</sub> (c) + 7 H<sub>2</sub>O (liq.) = Na<sub>2</sub>SO<sub>3</sub> · 7 H<sub>2</sub>O (c), *Q* = 2.67.

**NaHSO<sub>3</sub> (aq.).** Thomsen,<sup>15</sup> de Forcrand,<sup>4</sup> and Lindner<sup>1</sup> measured the heat of reaction of NaOH (aq.) with H<sub>2</sub>SO<sub>3</sub> (aq.). Their data yield the following values for *Qf*: Thomsen, NaHSO<sub>3</sub> (600), 206.30; de Forcrand, NaHSO<sub>3</sub> (370), 207.12; Lindner, NaHSO<sub>3</sub> (600), 206.17; Lindner NaHSO<sub>3</sub> (111), 207.15. de Forcrand<sup>4</sup> also measured the heat of mixing NaHSO<sub>3</sub> (aq.) with NaOH (aq.), and of Na<sub>2</sub>SO<sub>3</sub> (aq.) with H<sub>2</sub>SO<sub>3</sub> (aq.). These latter data yield for NaHSO<sub>3</sub> (500), *Qf* = 205.6 and 206.40.

**Na<sub>2</sub>SO<sub>4</sub> (aq.).** The heat of neutralization of H<sub>2</sub>SO<sub>4</sub> (aq.) with NaOH (aq.) was measured by Favre and Silbermann,<sup>3</sup> Andrews,<sup>2, 7, 11</sup> Favre,<sup>3</sup> Hess,<sup>5</sup> Thomsen,<sup>15</sup> Berthelot,<sup>4</sup> Recoura,<sup>2</sup> Mathews and Germann,<sup>1</sup> Richards and Rowe,<sup>4</sup> and Thorvaldson, Brown, and Peaker.<sup>1</sup> The data of the last six investigations yield, respectively, for Na<sub>2</sub>SO<sub>4</sub> (400), *Qf* = 330.69, 330.68, 331.4, 330.1, 331.06, and 331.06. Thomsen<sup>15</sup> measured the heat of mixing 2 NaCl (100) with H<sub>2</sub>SO<sub>4</sub> (200) and of Na<sub>2</sub>SO<sub>4</sub> (200) with 2 HCl (100). Subtraction of these heats of reaction gives that for 2 NaCl (100) + H<sub>2</sub>SO<sub>4</sub> (200) = Na<sub>2</sub>SO<sub>4</sub> (200) + 2 HCl (100); whence we have obtained the value for Na<sub>2</sub>SO<sub>4</sub> (200). In another pair of such "double decomposition" experiments, Thomsen<sup>15</sup> used twice the dilutions. His data yield, for Na<sub>2</sub>SO<sub>4</sub> (400), *Qf* = 330.68 and 331.02. Berthelot<sup>4</sup> performed similar "double decomposition" experiments, and his data yield, for Na<sub>2</sub>SO<sub>4</sub> (400), *Qf* = 331.25 from Na<sup>+</sup>, SO<sub>4</sub><sup>-</sup>, H<sup>+</sup>, NO<sub>3</sub><sup>-</sup>, and *Qf* = 331.07, from Na<sup>+</sup>, SO<sub>4</sub><sup>-</sup>, H<sup>+</sup>, Cl<sup>-</sup>. The data of Thomsen,<sup>15</sup> Varali-Thevenet,<sup>1</sup> and Lange and Streeck<sup>1</sup> have been used to obtain values for the heat of dilution of Na<sub>2</sub>SO<sub>4</sub> (aq.) from ∞ to 50 H<sub>2</sub>O.

**Na<sub>2</sub>SO<sub>4</sub> (c, II).** The data on the heat of solution yield the following values for *S*<sub>400</sub>: Thomsen,<sup>15</sup> 0.257; Tilden,<sup>2</sup> 0.25; Pickering,<sup>5</sup> -0.09. Other data on the heat of solution, lacking in most cases necessary information as to temperatures and concentration, were reported by Graham,<sup>1</sup> Favre and Valson,<sup>2</sup> Berthelot,<sup>10</sup> Berthelot and Ilosvay,<sup>1</sup> and Varali-Thevenet.<sup>1</sup> Mixer<sup>6</sup> measured, in a bomb calorimeter, the heat

of the reaction,  $3 \text{Na}_2\text{O}_2 (\text{c}) + \text{S} (\text{c}) = \text{Na}_2\text{SO}_4 (\text{c}) + 2 \text{Na}_2\text{O} (\text{c})$ , and his data yield  $Q_f = 328.4$ . See also Ruff and Friedrich.<sup>1</sup>

$\text{Na}_2\text{SO}_4 (\text{c}, \text{I})$ . For the heat of transition, see Hullner and Tammann<sup>1</sup> and Hare.<sup>1</sup>

$\text{Na}_2\text{SO}_4 (\text{liq.})$ . Hare<sup>1</sup> determined the heat of fusion.

$\text{Na}_2\text{SO}_4 \cdot 10 \text{H}_2\text{O} (\text{c})$ . The heat of solution data yield the following values for  $S_{400}$ : Thomsen,<sup>15</sup>  $-18.76$ ; Tilden,<sup>2</sup>  $-18.53$ ; Pickering,<sup>5</sup>  $-19.15$ ; Berthelot,<sup>10</sup>  $-18.85$ ; Favre and Valson,<sup>2</sup>  $-18.9(?)$ ; Perreu,<sup>1</sup>  $-18.6$ .

$\text{NaHSO}_4 (\text{aq.})$ . Thomsen<sup>15</sup> and Berthelot<sup>6</sup> measured the heat of mixing  $\text{Na}_2\text{SO}_4 (200)$  with  $\text{H}_2\text{SO}_4 (200)$  to be  $-1.870$  and  $-2.10$ , respectively. Taking  $-1.90$  gives for  $\text{NaHSO}_4 (200)$ ,  $Q_f = 270.29$ . The data of Thomsen<sup>15</sup> yield values for the heat of dilution from 10 to 800  $\text{H}_2\text{O}$ .

$\text{NaHSO}_4 (\text{c})$ . For  $S_{200}$ , the data of Thomsen<sup>15</sup> yield 1.25 and those of Berthelot 1.3.

$\text{NaHSO}_4 \cdot \text{H}_2\text{O} (\text{c})$ . Favre<sup>8</sup> measured the heat of solution.

$\text{Na}_2\text{S}_2\text{O}_5 (\text{aq.})$ . We have taken equal to zero the heat of the reaction,  $2 \text{HSO}_3^- (\text{aq.}) = \text{S}_2\text{O}_5^{2-} (\text{aq.}) + \text{H}_2\text{O} (\text{liq.})$ .

$\text{Na}_2\text{S}_2\text{O}_5 (\text{c})$ . de Forcrand<sup>4</sup> measured the heat of solution in water and in  $\text{NaOH} (\text{aq.})$ . These data give, for  $\text{Na}_2\text{S}_2\text{O}_5 (\text{c})$ ,  $Q_f = 349.2$  and 348.8, respectively.

$\text{Na}_2\text{S}_2\text{O}_3 (\text{aq.})$ . Thomsen<sup>15</sup> measured the heat of reaction of  $\text{Na}_2\text{S}_2\text{O}_3 (\text{aq.})$  with  $\text{HClO} (\text{aq.})$ ; Berthelot<sup>103</sup> that of  $\text{Na}_2\text{S}_2\text{O}_3 (\text{aq.})$  with  $\text{KBr}_3 (\text{aq.})$ . Their data yield, respectively, for  $\text{Na}_2\text{S}_2\text{O}_3 (\text{aq.})$ ,  $Q_f = 260.5$  and 263.7. Bichowsky<sup>3</sup> measured the heat of mixing aqueous  $\text{CaS}_2\text{O}_3$  with concentrated aqueous  $\text{HCl}$ , forming rhombic sulfur. Assuming the reaction,  $\text{S}_2\text{O}_3^{2-} (\text{aq.}) = \text{SO}_3^{2-} (\text{aq.}) + \text{S} (\text{c, rhombic})$ , his data,  $Q = -3.94$ , yield, for  $\text{S}_2\text{O}_3^{2-} (\text{aq.})$ ,  $Q_f = 145.1$ ; whence, for  $\text{Na}_2\text{S}_2\text{O}_3 (\text{aq.})$   $Q_f = 260.1$ . Thomsen measured the heat of mixing aqueous  $\text{Na}_2\text{S}_2\text{O}_3$  with aqueous  $\text{HCl}$  to be  $-2.2$ . Assuming the same reaction as before we have obtained, for  $\text{Na}_2\text{S}_2\text{O}_3 (\text{aq.})$ ,  $Q_f = 261.8$ .

$\text{Na}_2\text{S}_2\text{O}_3 (\text{c})$ . The data of Berthelot<sup>92</sup> yield  $S = 2.0_{440}$ ; Fogh<sup>1</sup> found  $S = 1.4$ .

$\text{Na}_2\text{S}_2\text{O}_3 \cdot 5 \text{H}_2\text{O} (\text{c}, \alpha)$ . The data of Thomsen<sup>15</sup> and Berthelot<sup>108</sup> yield, for  $S_{400}$ ,  $-11.33$  and  $-10.6$ , respectively.

$\text{Na}_2\text{S}_2\text{O}_3 \cdot 5 \text{H}_2\text{O} (\text{c}, \beta)$ . Muller<sup>11</sup> measured the heat of solidification of the supercooled liquid, and found, for the  $\alpha$  and  $\beta$  forms of the solid, respectively,  $F^{17.5} = -9.3$  and  $-8.0$ ; whence, for the  $\alpha$  to  $\beta$  transition,  $T = -1.3^{17.5}$ .

$\text{Na}_2\text{S}_2\text{O}_3 (5)$ .  $Q_f$  for this substance is obtained from the foregoing data.

$\text{Na}_2\text{S}_2\text{O}_6 (\text{aq.})$ . The value for this substance is obtained from those for the ions.

$\text{Na}_2\text{S}_2\text{O}_6 \cdot n \text{H}_2\text{O} (\text{c})$ . Thomsen<sup>15</sup> measured the heats of solution of the anhydrous salt and the dihydrate.

$\text{Na}_2\text{S}_3\text{O}_6$  (aq.). Berthelot<sup>108</sup> measured the heat of reaction of  $\text{Na}_2\text{S}_3\text{O}_6$  (aq.) with  $\text{KBr}_3$  (aq.). His data yield  $Q_f = 394.6$ .

$\text{Na}_2\text{S}_3\text{O}_6 \cdot 3\text{H}_2\text{O}$  (c). Berthelot<sup>108</sup> measured the heat of solution.

$\text{Na}_2\text{S}_4\text{O}_6$  (aq.). Thomsen<sup>15</sup> and Berthelot<sup>108</sup> measured the heat of the reaction,  $2\text{Na}_2\text{S}_2\text{O}_8$  (aq.) +  $\text{I}_2$  (c) =  $(2\text{NaI} + \text{Na}_2\text{S}_4\text{O}_6)$  (aq.). Their data yield, for  $\text{Na}_2\text{S}_4\text{O}_6$  (aq.),  $Q_f = 387.3$  and  $388.1$ , respectively. Berthelot<sup>108</sup> also measured the heat of reaction between  $\text{Na}_2\text{S}_4\text{O}_6 \cdot 2\text{H}_2\text{O}$  (c) and  $\text{KBr}_3$  (aq.) (with the formation of sulfate), and the heat of solution of the dihydrate; and from these data we have obtained, for  $\text{Na}_2\text{S}_4\text{O}_6$  (aq.),  $Q_f = 387.2$ .

$\text{Na}_2\text{S}_4\text{O}_6 \cdot 2\text{H}_2\text{O}$  (c). Berthelot<sup>108</sup> measured the heat of solution.

$\text{NaI} \cdot n\text{SO}_2$  (c). From measurement of the dissociation pressure at various temperatures, Ephraim and Kornblum<sup>1</sup> found for  $n = 4$ ,  $D = -9.63$ , and for  $n = 2$ ,  $D = -10.0$ ; de Forcrand and Taboury,<sup>1</sup> found for  $n = 2$ ,  $D = -10.25$ .

$\text{Na}_2\text{Se}$  (aq.). Fabre<sup>1</sup> measured the heat of neutralization of  $\text{NaOH}$  (220) with  $\text{H}_2\text{Se}$  (g) and  $\text{H}_2\text{Se}$  (4000), respectively. His data yield for  $Q_f$ ,  $\text{Na}_2\text{Se}$  (440), 77.12;  $\text{Na}_2\text{Se}$  (4400), 78.64.

$\text{Na}_2\text{Se} \cdot n\text{H}_2\text{O}$  (c). Fabre<sup>1</sup> measured the heats of solution of the anhydrous salt and of the hydrates with  $4\frac{1}{2}$ , 9, and 16 moles of  $\text{H}_2\text{O}$ .

$\text{NaHSe}$  (aq.). Fabre<sup>1</sup> measured the heat of the reaction of  $\text{H}_2\text{Se}$  (aq.) with  $\text{NaOH}$  (aq.), and of  $\text{NaHSe}$  (aq.) with  $\text{NaOH}$  (aq.). These data yield, respectively,  $Q_f = 31.24$  and  $30.81$ , for  $\text{NaHSe}$  (aq.).

$\text{Na}_2\text{SeO}_3$  (aq.). Thomsen<sup>15</sup> measured the heat of neutralization of  $\text{H}_2\text{SeO}_3$  (aq.) with  $\text{NaOH}$  (aq.). His data yield, for  $\text{Na}_2\text{SeO}_3$  (800),  $Q_f = 238.22$ .

$\text{NaHSeO}_3$  (aq.). Thomsen<sup>15</sup> found  $Q = 14.76$  for the reaction,  $\text{NaOH}$  (400) +  $\text{H}_2\text{SeO}_3$  (800) =  $\text{NaHSeO}_3$  (1200) +  $\text{H}_2\text{O}$  (liq.).

$\text{Na}_2\text{SeO}_4$  (aq.). The data of Thomsen<sup>15</sup> yield  $N = 30.41_{800}$ , and those of Metzner,<sup>2</sup>  $N = 31.05_{440}$ ; whence we have computed, for  $\text{Na}_2\text{SeO}_4$  (800),  $Q_f = 260.99$  and for  $\text{Na}_2\text{SeO}_4$  (440),  $Q_f = 261.41$ .

$\text{NaHSeO}_4$  (aq.). Thomsen<sup>15</sup> and Metzner<sup>2</sup> measured the heat of mixing  $\text{Na}_2\text{SeO}_4$  (aq.) with  $\text{H}_2\text{SeO}_4$  (aq.). Their data yield, respectively,  $\text{NaHSeO}_4$  (400)  $Q_f = 201.72$  and  $\text{NaHSeO}_4$  (220),  $Q_f = 201.79$ .

$\text{Na}_2\text{SeO}_4$  (c). Mixer<sup>10</sup> measured, in a bomb calorimeter, the heat of reaction between amorphous  $\text{Se}$  and  $\text{Na}_2\text{O}_2$  to be 95.9.

$\text{Na}_2\text{TeO}_4$  (c). As for the foregoing, Mixer<sup>10</sup> found 149.7.

$\text{NaNO}_3$  (aq.). The heat of neutralization of  $\text{NaOH}$  (aq.) with  $\text{HNO}_3$  (aq.) was measured by Hess,<sup>6</sup> Andrews,<sup>11</sup> Favre and Silbermann,<sup>3</sup> Favre,<sup>3</sup> Thomsen,<sup>15</sup> Berthelot,<sup>4</sup> Mathews and Germann,<sup>1</sup> and Richards and Rowe.<sup>3</sup> The accurate data of Richards and Rowe were recomputed by Rossini,<sup>6</sup> giving  $N = 13.929_{201}$ . The data on the heat of dilution of  $\text{NaNO}_3$  from infinite dilution to  $25\text{H}_2\text{O}$ , (Pratt,<sup>1</sup> Richards and Rowe,<sup>2</sup> Nernst and Naude,<sup>1</sup> Lange and Robinson<sup>2</sup>) were reviewed by Rossini,<sup>5</sup> who gave values from  $\infty$  to  $25\text{H}_2\text{O}$ . The data of Stahlberg,<sup>1</sup> Stackelberg,<sup>1</sup> and van Deventer and van der Stadt<sup>1</sup> have been utilized to obtain values from

25 to 5 H<sub>2</sub>O. Other data on the heat of dilution were given by Bishop,<sup>1</sup> Rümelin,<sup>1</sup> and Mondain-Monval.<sup>3</sup>

**NaNO<sub>3</sub> (c).** The existing data on the heat of solution have been recomputed to give the following values for  $S_{200}$ : Winkelmann,<sup>1</sup> -4.91; Berthelot,<sup>10, 131</sup> -4.83; Tilden,<sup>2</sup> -4.91; Zawidski and Schagger,<sup>1</sup> -5.02; Thomsen,<sup>15</sup> -5.03; Scholz,<sup>1</sup> -5.05; Stackelberg,<sup>1</sup> -5.04; Varali-Thevenit,<sup>1</sup> -4.84; Haigh,<sup>1</sup> -4.95; and Mondain-Monval,<sup>3</sup> -4.86. The average of these values is  $-4.94 \pm 0.07$ . Brönsted,<sup>10</sup> by measuring the electromotive force of cells at various temperatures, found, for KCl (c) + NaNO<sub>3</sub> (c) = NaCl (c) + KNO<sub>3</sub> (c),  $Q = 0.340$ . Anticipating the values for KCl (c) and KNO<sub>3</sub> (c), we have computed for NaNO<sub>3</sub> (c),  $Q_f = 111.72$ . This corresponds to  $S = -4.965_{200}$ .

**NaNO<sub>2</sub> (c).** The data of Matignon and Marchal<sup>3</sup> and Swietoslawski<sup>6</sup> yield identical values for the heat of solution.

**NaNH<sub>2</sub> (c).** de Forcrand<sup>24</sup> measured the heat of solution in water.

**NaNH<sub>3</sub> (c).** Joannis<sup>3</sup> found  $D = -5.19_{20}$

**NaX · nNH<sub>3</sub> (c).** Joannis<sup>6</sup> measured the temperature coefficient of the dissociation pressure of NaCl · 5 NH<sub>3</sub> (c); Biltz and Hansen<sup>1</sup> measured those of NaCl · 5 NH<sub>3</sub> (c), NaBr · 5½ NH<sub>3</sub> (c), NaBr · 5¾ NH<sub>3</sub> (c), NaI · 4½ NH<sub>3</sub> (c), and NaI · 6 NH<sub>3</sub> (c).

**Na<sub>2</sub>SO<sub>4</sub> · (NH<sub>4</sub>)<sub>2</sub>SO<sub>4</sub> · H<sub>2</sub>O (c).** Matignon and Meyer<sup>1</sup> measured the heat of solution.

**NaPO<sub>3</sub> (aq.).** Thomsen<sup>15</sup> and Giran<sup>1</sup> measured the heat of neutralization of HPO<sub>3</sub> (aq.) with NaOH (aq.). Their data give, respectively, NaPO<sub>3</sub> (600),  $Q_f = 292.67$ , and NaPO<sub>3</sub> (aq.),  $Q_f = 293.08$ .

**NaPO<sub>3</sub> (c).** Giran<sup>1</sup> measured the heat of solution.

**Na<sub>n</sub>H<sub>3-n</sub>PO<sub>3</sub> (aq.).** Thomsen<sup>1</sup> measured the heat of mixing H<sub>3</sub>PO<sub>3</sub> (400) with 1, 2, and 3 moles of NaOH (200), respectively, forming NaH<sub>2</sub>PO<sub>3</sub> (600), Na<sub>2</sub>HPO<sub>3</sub> (800), and Na<sub>3</sub>PO<sub>3</sub> (1000).

**NaH<sub>2</sub>PO<sub>3</sub> · nH<sub>2</sub>O (c).** Amat<sup>1</sup> measured the heats of solution of NaH<sub>2</sub>PO<sub>3</sub> (c) and NaH<sub>2</sub>PO<sub>3</sub> · 2½ H<sub>2</sub>O (c).

**Na<sub>2</sub>HPO<sub>3</sub> · nH<sub>2</sub>O (c).** Amat<sup>1</sup> measured the heats of solution of the anhydrous salt and the pentahydrate.

**Na<sub>n</sub>H<sub>2-n</sub>PO<sub>2</sub> (aq.).** Thomsen<sup>15</sup> measured the heat of mixing H<sub>3</sub>PO<sub>2</sub> (250) with 1 and 2 moles of NaOH (200), respectively.

**Na<sub>3</sub>PO<sub>4</sub> · 12 H<sub>2</sub>O (c).** Joly<sup>4</sup> measured the heat of solution.

**Na<sub>3</sub>PO<sub>4</sub> (c).** The data of Mixer,<sup>9</sup> who measured the heat of reaction between 1½ Na<sub>2</sub>O (c) and ½ P<sub>2</sub>O<sub>5</sub> (c), in a bomb calorimeter, yield  $Q_f = 446$ . We have obtained, by estimating the heat of dehydration of the dodecahydrate,  $Q_f = 457$ .

**Na<sub>3</sub>PO<sub>4</sub> (aq.).** The data of Thomsen<sup>15</sup> and Berthelot and Louguinine<sup>3</sup> yield, respectively,  $N = 34.10_{903}$  and  $N = 33.45_{663}$ ; whence, for Na<sub>3</sub>PO<sub>4</sub> (800), we have computed  $Q_f = 471.54$  and 470.53. Berthelot and Louguinine<sup>3</sup> measured the heat of dilution from 330 to 1980 H<sub>2</sub>O.

**NaH<sub>2</sub>PO<sub>4</sub> (aq.).** Thomsen<sup>15</sup> and Berthelot and Louguinine<sup>3</sup> measured the heat of mixing H<sub>3</sub>PO<sub>4</sub> (aq.) with NaOH (aq.). Their data yield,

respectively,  $\text{NaH}_2\text{PO}_4(300)$ ,  $Q_f = 364.64$ , and  $\text{NaH}_2\text{PO}_4(440)$ ,  $Q_f = 364.68$ . Berthelot and Louguinine<sup>3</sup> measured the heat of mixing  $\text{NaH}_2\text{PO}_4(440)$  with  $\text{HCl}(110)$  and of  $\text{H}_3\text{PO}_4(440)$  with  $\text{NaCl}(110)$ , their data yielding, for  $\text{NaH}_2\text{PO}_4(440)$ ,  $Q_f = 365.03$ .

**$\text{Na}_2\text{HPO}_4(\text{aq.})$ .** Thomsen<sup>15</sup> and Berthelot and Louguinine<sup>3</sup> measured the heat of mixing  $\text{H}_3\text{PO}_4(\text{aq.})$  with  $2\text{NaOH}(\text{aq.})$ ; Berthelot and Louguinine<sup>3</sup> measured the heat of mixing  $\text{Na}_2\text{HPO}_4(440)$  with  $\text{NaOH}(\text{aq.})$ . These data yield, respectively, for  $\text{Na}_2\text{HPO}_4(400)$ ,  $Q_f = 420.81$ ,  $419.93$ , and  $420.43$ . Berthelot and Louguinine<sup>3</sup> measured the heat of dilution of  $\text{Na}_2\text{HPO}_4(\text{aq.})$  from 220 to  $880\text{H}_2\text{O}$ .

**$\text{Na}_2\text{HPO}_4 \cdot n\text{H}_2\text{O}(\text{c.})$ .** Thomsen<sup>15</sup> and Pfaundler<sup>2</sup> measured the heats of solution of the anhydrous salt and the hydrates with 7 and 12 moles of  $\text{H}_2\text{O}$ . Thomsen<sup>15</sup> also measured that of the dihydrate. Their data yield for  $S_{400}$  the following respective values, for Thomsen and Pfaundler: for  $\text{Na}_2\text{HPO}_4(\text{c.})$ , 5.65, 5.37; dihydrate,  $-0.38$ , . . . ; heptahydrate,  $-11.60$ ,  $-11.38$ ; dodecahydrate,  $-22.74$ ,  $-22.53$ . See also Perreu.<sup>1</sup> Muller-Erbach<sup>4</sup> measured the temperature-dissociation pressure relationship for the heptahydrate.

**$\text{NaH}_3\text{P}_2\text{O}_7(\text{aq.})$ .** Thomsen<sup>15</sup> and Giran<sup>1</sup> found, respectively,  $\text{NaOH}(400) + \text{H}_4\text{P}_2\text{O}_7(800)$ ,  $N = 14.38$ ;  $\text{NaOH}(\text{aq.}) + \text{H}_4\text{P}_2\text{O}_7(\text{aq.})$ ,  $N = 15.29$ .<sup>7</sup>

**$\text{NaH}_3\text{P}_2\text{O}_7 \cdot n\text{H}_2\text{O}(\text{c.})$ .** Giran<sup>1</sup> measured the heats of solution of the anhydrous salt and the monohydrate.

**$\text{Na}_2\text{H}_2\text{P}_2\text{O}_7(\text{aq.})$ .** Thomsen<sup>15</sup> and Giran<sup>1</sup> found, respectively,  $2\text{NaOH}(200) + \text{H}_4\text{P}_2\text{O}_7(800)$ ,  $N = 28.64^{17.5}$ ;  $2\text{NaOH}(\text{aq.}) + \text{H}_4\text{P}_2\text{O}_7(\text{aq.})$ ,  $N = 29.94$ .<sup>7</sup> Favre and Silbermann<sup>3</sup> also measured this heat of neutralization.

**$\text{Na}_2\text{H}_2\text{P}_2\text{O}_7 \cdot n\text{H}_2\text{O}(\text{c.})$ .** Giran<sup>1</sup> measured the heats of solution of the anhydrous salt and the hexahydrate.

**$\text{Na}_3\text{HP}_2\text{O}_7(\text{aq.})$ .** Giran<sup>1</sup> found  $N = 43.05$ .<sup>7</sup>

**$\text{Na}_3\text{HP}_2\text{O}_7 \cdot n\text{H}_2\text{O}(\text{c.})$ .** Giran<sup>1</sup> measured the heats of solution of the anhydrous salt and the mono- and hexahydrates.

**$\text{Na}_4\text{P}_2\text{O}_7(\text{aq.})$ .** Thomsen<sup>15</sup> found  $N = 52.74_{1600}$ ; Giran,<sup>1</sup>  $N = 50.91$ .<sup>7</sup>

**$\text{Na}_4\text{P}_2\text{O}_7 \cdot n\text{H}_2\text{O}(\text{c.})$ .** Thomsen<sup>15</sup> measured the heats of solution of the anhydrous salt and the decahydrate.

**$\text{Na}_2\text{H}_2\text{P}_2\text{O}_5(\text{c.})$ .** Amat<sup>1</sup> measured the heats of solution, in aqueous  $\text{H}_2\text{SO}_4$ , of  $\text{Na}_2\text{H}_2\text{P}_2\text{O}_5(\text{c.})$  and of  $2\text{NaH}_3\text{PO}_3(\text{c.})$ . The difference yields, for  $\text{Na}_2\text{H}_2\text{P}_2\text{O}_5(\text{c.}) + \text{H}_2\text{O}(\text{liq.}) = 2\text{NaH}_2\text{PO}_3(\text{c.})$ ,  $Q = 4.80$ .

**$\text{Na}_2\text{H}_2\text{P}_2\text{O}_5(\text{aq.})$ .** Amat<sup>1</sup> measured the heat of solution.

**$\text{Na}_n\text{H}_{4-n}\text{P}_2\text{O}_6(\text{aq.})$ .** Joly<sup>2</sup> measured the heat of mixing  $\text{H}_4\text{P}_2\text{O}_6(330)$  with 1, 2, 3, and 4 moles of  $\text{NaOH}(220)$ , respectively.

**$\text{NaNH}_4\text{HPO}_4(\text{aq.})$ .** Berthelot and Louguinine<sup>3</sup> measured the heat of mixing  $\text{NaH}_2\text{PO}_4(440)$  with  $\text{NH}_3(110)$ .

**$\text{Na}(\text{NH}_4)_2\text{PO}_4(\text{aq.})$ .** Berthelot and Louguinine<sup>3</sup> measured the heat of mixing  $\text{NaNH}_4\text{HPO}_4(550)$  with  $\text{NH}_3(110)$ .

**$\text{Na}_2\text{NH}_4\text{PO}_4(\text{aq.})$ .** Berthelot<sup>146</sup> measured the heat of mixing  $\text{Na}_2\text{HPO}_4(440)$  with  $\text{NH}_3(110)$ .

$\text{NaNH}_4\text{HPO}_4 \cdot 4 \text{H}_2\text{O}$  (c). Thomsen<sup>15</sup> measured the heat of solution.

$\text{Na}_n\text{H}_{3-n}\text{AsO}_4$  (aq.). Thomsen<sup>15</sup> measured the heat of mixing  $\text{H}_3\text{AsO}_4$  (200) with 1, 2, and 3 moles of  $\text{NaOH}$  (100), respectively.

$\text{Na}_3\text{AsO}_4 \cdot 12 \text{H}_2\text{O}$  (c). Joly<sup>4</sup> measured the heat of solution.

$\text{Na}_3\text{AsO}_4$  (c). The data of Mixer,<sup>9</sup> who measured in a bomb calorimeter the heat of reaction between As (c) and  $2\frac{1}{2} \text{Na}_2\text{O}_2$  (c), yield  $Q_f = 361$ . By estimating the heat of dehydration of the dodecahydrate, we have obtained  $Q_f = 366$ .

$\text{Na}_n\text{H}_{3-n}\text{AsO}_3$  (aq.). Thomsen<sup>15</sup> measured the heat of mixing of  $\text{H}_3\text{AsO}_3$  (200) with 1, 2, and 3 moles of  $\text{NaOH}$  (aq.), respectively.

$\text{Na}_3\text{SbO}_4$  (c). The data of Mixer<sup>9</sup> on the reaction of Sb (c) with  $2\frac{1}{2} \text{Na}_2\text{O}_2$  (c) yield  $Q_f = 349$ .

$\text{Na}_3\text{SbO}_4$  (aq.). We have estimated  $S = 11$ .

$3 \text{Na}_2\text{S} \cdot \text{Sb}_2\text{S}_3$  (aq.). Berthelot<sup>90</sup> measured the heat of reaction of  $3 \text{Na}_2\text{S} \cdot \text{Sb}_2\text{S}_3$  (aq.) with  $6 \text{HCl}$  (aq.).

$\text{Na}_3\text{BiO}_4$  (c). The data of Mixer<sup>9</sup> yield  $Q_f = 284$ .

$\text{Na}_2\text{C}_2$  (c). de Forcrand<sup>23</sup> measured the heat of solution of  $\text{Na}_2\text{C}_2$  (c) in  $\text{H}_2\text{SO}_4$  (aq.); Matignon<sup>16</sup> that in  $\text{HCl}$  (aq.). Their data yield, respectively,  $Q_f = -4.4$  and  $-4.06$ .

$\text{NaHC}_2$  (c). Matignon<sup>16</sup> measured the heat of solution in water and in  $\text{HCl}$  (aq.). His data yield, respectively,  $Q_f = -25.19$  and  $-25.05$ .

$\text{Na}_2\text{CO}_3$  (aq.). Berthelot<sup>4</sup> and Thomsen<sup>15</sup> measured the heat of reaction of  $\text{CO}_2$  (aq.) with  $2 \text{NaOH}$  (aq.); Muller<sup>1</sup> that of  $\text{Na}_2\text{CO}_3$  (aq.) with  $2 \text{HCl}$  (aq.). Their data yield, respectively, for  $\text{Na}_2\text{CO}_3$  (200),  $Q_f = 276.0$ ,  $276.24$ , and  $275.7$ . Berthelot<sup>4</sup> performed some "double decomposition" experiments, and his data yield the following values for  $\text{Na}_2\text{CO}_3$  (200): from  $\text{Na}^+$ ,  $\text{CO}_3^{--}$ ,  $\text{H}^+$ ,  $\text{C}_2\text{H}_3\text{O}_2^-$ ,  $276.1$ ; from  $\text{Na}^+$ ,  $\text{CO}_3^{--}$ ,  $\text{H}^+$ ,  $\text{SO}_4^{--}$ ,  $267.4$ ; and from  $\text{Na}^+$ ,  $\text{CO}_3^{--}$ ,  $\text{H}^+$ ,  $\text{NO}_3^-$ ,  $276.8$ . Data on the heat of dilution were reported by Thomsen,<sup>15</sup> Perreu,<sup>2</sup> and Laksonen.<sup>1</sup> These data covered the range as dilute as 200  $\text{H}_2\text{O}$ . Values to infinite dilution have been estimated. See also Swallow and Alty.<sup>1</sup>

$\text{Na}_2\text{CO}_3$  (c, II). The data on the heat of solution have been recomputed to give the following values for  $S_{200}$ : Favre and Valson,<sup>2</sup> ?; Berthelot,<sup>10</sup>  $6.0$ ; Ostwald,<sup>1</sup>  $5.80$ ; Berthelot and Ilosvay,<sup>1</sup>  $5.8$ ; Tilden,<sup>2</sup>  $5.74$ ; Thomsen,<sup>15</sup>  $5.88$ ; Pickering,<sup>7</sup>  $5.70$ ; Donnan and Hope,<sup>1</sup>  $5.85$ . See also Swallow and Alty.<sup>1</sup>

$\text{Na}_2\text{CO}_3$  (c, I). Doelter<sup>1</sup> quoted Wegscheider<sup>1</sup> as giving  $T = 0.4 \rightarrow \infty$ <sup>450</sup>.

$\text{Na}_2\text{CO}_3$  (liq.). Sackur<sup>1</sup> determined the heat of fusion from freezing point lowering data.

$\text{Na}_2\text{CO}_3 \cdot \text{H}_2\text{O}$  (c). For  $S_{200}$ , the data of Thomsen<sup>15</sup> yield  $2.50$ , those of Donnan and Hope<sup>1</sup>  $1.95$ . The dissociation pressure data of Caven and Sand<sup>1</sup> give  $Q_f = 341.6$ .

$\text{Na}_2\text{CO}_3 \cdot 7 \text{H}_2\text{O}$  (c). For  $S_{200}$ , the data of Thomsen<sup>15</sup> yield  $-10.50$ , those of Donnan and Hope<sup>1</sup>  $-10.55$ .

$\text{Na}_2\text{CO}_3 \cdot 10 \text{H}_2\text{O}$  (c). The heat of solution data yield the following values for  $S_{200}$ : Favre and Valson,<sup>2</sup> ?; Tilden,<sup>2</sup>  $-14.82$ ; Thomsen,<sup>15</sup>

—15.91; Pickering,<sup>7</sup> —15.91; Donnan and Hope,<sup>1</sup> —15.25; and Perreu,<sup>1</sup> —16.0.

**NaHCO<sub>3</sub> (aq.).** Berthelot<sup>4</sup> measured the heat of mixing CO<sub>2</sub>(1600) with NaOH(110); Thomsen<sup>15</sup> that of NaHCO<sub>3</sub>(200) with NaOH(200); Muller<sup>1</sup> that of NaHCO<sub>3</sub>(1000) with HCl(90). Their data yield, respectively, NaHCO<sub>3</sub>(1700),  $Q_f=222.41$ , NaHCO<sub>3</sub>(200),  $Q_f=222.67$ , and NaHCO<sub>3</sub>(1000),  $Q_f=222.0$ .

**NaHCO<sub>3</sub> (c).** The data of Berthelot<sup>10</sup> yield  $S=-4.1_{300}$ , whence  $Q_f=226.4$ . The dissociation pressure data of Caven and Sand<sup>1</sup> yield the same value.

**Na<sub>2</sub>C<sub>2</sub>O<sub>4</sub> (aq.).** The heat of neutralization of aqueous oxalic acid with aqueous NaOH was measured by Berthelot<sup>7</sup> and Thomsen.<sup>15</sup> Their data yield, respectively, Na<sub>2</sub>C<sub>2</sub>O<sub>4</sub> (aq.),  $Q_f=310.92$ , and Na<sub>2</sub>C<sub>2</sub>O<sub>4</sub>(600),  $Q_f=310.58$ . Berthelot<sup>7</sup> also performed 2 pairs of "double decomposition" experiments, his data yielding for Na<sub>2</sub>C<sub>2</sub>O<sub>4</sub>(220),  $Q_f=311.42$  from Na<sup>+</sup>, C<sub>2</sub>O<sub>4</sub><sup>2-</sup>, H<sup>+</sup>, SO<sub>4</sub><sup>2-</sup>, and  $Q_f=311.30$  from Na<sup>+</sup>, C<sub>2</sub>O<sub>4</sub><sup>2-</sup>, H<sup>+</sup>, C<sub>2</sub>H<sub>3</sub>O<sub>2</sub><sup>-</sup>. Roth and Eymann<sup>1</sup> measured the heat of neutralization of aqueous NaOH with solid oxalic acid containing 26.7% of H<sub>2</sub>O, and the heat of solution of the latter. Their data yield for Na<sub>2</sub>C<sub>2</sub>O<sub>4</sub>(1120),  $Q_f=310.39$ .

**Na<sub>2</sub>C<sub>2</sub>O<sub>4</sub> (c).** Berthelot<sup>10</sup> measured the heat of solution.

**NaHC<sub>2</sub>O<sub>4</sub> (aq.).** Berthelot<sup>6</sup> measured the heat of mixing Na<sub>2</sub>C<sub>2</sub>O<sub>4</sub>(220) with H<sub>2</sub>C<sub>2</sub>O<sub>4</sub>(220); Berthelot<sup>7</sup> and Thomsen<sup>15</sup> that of mixing H<sub>2</sub>C<sub>2</sub>O<sub>4</sub> (aq.) with NaOH (aq.). Their data yield, respectively, NaHC<sub>2</sub>O<sub>4</sub>(400),  $Q_f=252.5$ , NaHC<sub>2</sub>O<sub>4</sub>(400),  $Q_f=252.43$ , and NaHC<sub>2</sub>O<sub>4</sub>(220),  $Q_f=252.50$ .

**NaHC<sub>2</sub>O<sub>4</sub> · nH<sub>2</sub>O (c).** Berthelot<sup>10, 131</sup> measured the heat of solution of the anhydrous salt and its monohydrate.

**NaCHO<sub>2</sub> (aq.).** Thomsen<sup>15</sup> measured the heat of neutralization of aqueous formic acid with aqueous NaOH; Berthelot<sup>7</sup> performed 2 pairs of "double decomposition" experiments involving H<sup>+</sup>, Cl<sup>-</sup>, Na<sup>+</sup>, CHO<sub>2</sub><sup>-</sup>. Their data yield, respectively, NaCHO<sub>2</sub>(400),  $Q_f=157.29$ , NaCHO<sub>2</sub>(165),  $Q_f=157.25$ , and NaCHO<sub>2</sub>(110),  $Q_f=157.19$ .

**NaCHO<sub>2</sub> (c).** Berthelot<sup>10</sup> measured the heat of solution of sodium formate.

**NaC<sub>2</sub>H<sub>3</sub>O<sub>2</sub> (aq.).** The heat of neutralization of aqueous acetic acid with aqueous NaOH was measured by Berthelot,<sup>7</sup> Thomsen,<sup>15</sup> and Richards and Mair.<sup>1</sup> These data yield, respectively, for NaC<sub>2</sub>H<sub>3</sub>O<sub>2</sub>(200),  $Q_f=175.38$ , 175.08, and 175.237. Data on the heat of dilution were reported by Berthelot<sup>5</sup> and Thomsen.<sup>15</sup> Richards and Gucker<sup>1</sup> measured the heat of dilution in the range 25 to 1600 H<sub>2</sub>O. We have extrapolated these data to infinite dilution, and, using the data of Gnesotto and Fabris,<sup>1</sup> who obtained a value for the heat of fusion of NaC<sub>2</sub>H<sub>3</sub>O<sub>2</sub> · 3 H<sub>2</sub>O (c), we have extended the values to 3 H<sub>2</sub>O.

**NaC<sub>2</sub>H<sub>3</sub>O<sub>2</sub> (c).** The data on the heat of solution of sodium acetate yield the following values for  $S_{200}$ : Berthelot,<sup>7, 131</sup> 4.0; Thomsen,<sup>15</sup> 3.88; and Pickering,<sup>7</sup> 3.95.

$\text{NaC}_2\text{H}_3\text{O}_2 \cdot 3 \text{H}_2\text{O}$  (c). The heat of solution data yield the following values for  $S_{200}$ : Berthelot,<sup>7, 131</sup>  $-4.61$ ; Thomsen,<sup>15</sup>  $-4.86$ ; Pickering,<sup>7</sup>  $-4.77$ ; and Calvet,<sup>1</sup>  $-4.72$ .

$\text{NaC}_2\text{H}_3\text{O}_2(\text{C}_2\text{H}_5\text{OH})$ . Pickering<sup>8</sup> measured the heat of solution of sodium acetate in ethyl alcohol.

$\text{NaCH}_3\text{O}(\text{CH}_3\text{OH})$ ,  $\text{NaC}_2\text{H}_5\text{O}(\text{C}_2\text{H}_5\text{OH})$ . de Forcrand<sup>16</sup> measured the heat of solution of Na (c) in methyl alcohol and in ethyl alcohol. See also Cavalier.<sup>1</sup>

$\text{NaC}_2\text{H}_3\text{O}_3$  (aq.). de Forcrand<sup>3</sup> measured the heat of neutralization of aqueous glycollic acid.

$\text{NaC}_2\text{H}_3\text{O}_3 \cdot n\text{H}_2\text{O}$  (c). de Forcrand<sup>3</sup> measured the heats of solution of the anhydrous salt, the hemihydrate, and the dihydrate of sodium glycollate.

$\text{NaC}_2\text{H}_3\text{O}_3 \cdot \text{HC}_2\text{H}_3\text{O}_3$  (c). de Forcrand<sup>3</sup> measured the heat of solution of sodium acid glycollate.

$\text{NaC}_2\text{H}_3\text{O}_4$  (aq.). de Forcrand<sup>3</sup> measured the heat of neutralization to form sodium glyoxylate.

$\text{NaC}_2\text{H}_3\text{O}_4$  (c). de Forcrand<sup>17</sup> measured the heat of solution of sodium glyoxylate.

$\text{NaC}_2\text{H}_5\text{O}_2$  (aq.). de Forcrand<sup>6a</sup> measured the heat of solution of liquid ethylene glycol in aqueous NaOH.

$\text{NaC}_2\text{H}_5\text{O}_2$  (c). de Forcrand<sup>6a</sup> measured the heat of solution of sodium glycol.

$\text{NaC}_2\text{H}_5\text{O}_2 \cdot \text{C}_2\text{H}_6\text{O}_2$  (c). de Forcrand<sup>6a</sup> measured the heat of solution of sodium glycol-glycol.

$\text{NaC}_2\text{H}_5\text{O}_2 \cdot \text{CH}_3\text{OH}$  (c). de Forcrand<sup>6a</sup> measured the heat of solution of sodium glycol-methanol.

$\text{NaC}_2\text{H}_5\text{O}_2 \cdot \text{C}_2\text{H}_5\text{OH}$  (c). de Forcrand<sup>6a</sup> measured the heat of solution of sodium glycol-ethanol.

$\text{NaC}_2\text{H}_5\text{SO}_4$  (aq.). Thomsen<sup>15</sup> measured the heat of the reaction,  $\text{Na}_2\text{SO}_4(400) + \text{Ba}(\text{C}_2\text{H}_5\text{SO}_4)_2(800) = \text{BaSO}_4(\text{c}) + 2 \text{NaC}_2\text{H}_5\text{SO}_4(600)$ .

$\text{Na}_2\text{S}_2\text{O}_5 \cdot \text{C}_2\text{H}_2\text{O}_2 \cdot 2 \text{H}_2\text{O}$  (c). de Forcrand<sup>3</sup> measured the heat of solution.

$\text{NaCN}$  (aq.). The data of Thomsen<sup>15</sup> yield  $N=2.75_{200}$ .

$\text{NaCN} \cdot n\text{H}_2\text{O}$  (c). Joannis<sup>1</sup> measured the heat of solution of the anhydrous salt, the hemihydrate, and the dihydrate.

$\text{NaCNO}$  (c). Lemoult<sup>1</sup> measured the heat of solution of  $\text{NaCNO}$  (c) in  $\text{HCl}$  (aq.) and in  $\text{HNO}_3$  (aq.).

$\text{NaCNO}$  (aq.). Lemoult<sup>1</sup> measured the heat of solution of  $\text{NaCNO}$  (c) in water.

$\text{NaCN}_2\text{H}$  (aq.). Lemoult<sup>1</sup> measured the heat of neutralization of  $\text{HCN}_2\text{H}$  (c), and of  $\text{HCN}_2\text{H}$  (aq.), with  $\text{NaOH}$  (aq.).

$\text{NaCNS}$  (aq.). Joannis<sup>1</sup> measured the heat of neutralization, his data yielding  $N=14.04$ . The heat of dilution was measured by Partington and Soper<sup>1</sup> in the range 3.55 to 330  $\text{H}_2\text{O}$ . We have extrapolated the values to infinite dilution.

**NaCNS (c).** The data of Vrzhesnevskii<sup>1</sup> and Partington and Soper<sup>1</sup> yield, respectively, for  $S_{200}$ ,  $-1.77$  and  $-1.80$ .

**NaCNS(C<sub>2</sub>H<sub>5</sub>OH).** Partington and Soper<sup>1</sup> measured the heat of solution of NaCNS (c) in various amounts of ethyl alcohol.

**Na<sub>2</sub>SiO<sub>3</sub> (c).** The data of Tammann<sup>3</sup> (quoted by Mulert<sup>1</sup>), who measured the heat of solution in 20% HF (aq.), yield  $Q_f=371.2$ . Matignon<sup>11</sup> measured the heat of mixing Na<sub>2</sub>SiO<sub>3</sub> (c) with HCl (aq.), his data yielding  $Q_f=351$ .

**Na<sub>2</sub>SiO<sub>3</sub> (gls.).** In a bomb calorimeter, Mixer<sup>5</sup> measured the heat of reaction of Si (c) with 2 Na<sub>2</sub>O<sub>2</sub> (c) and of SiC (c) with 4 Na<sub>2</sub>O<sub>2</sub> (c); Tschernobaeff<sup>1</sup> that of SiO<sub>2</sub> ( $\alpha$  Quartz) with Na<sub>2</sub>CO<sub>3</sub> (c). Their data yield, respectively,  $Q_f=373.5$ ,  $374.7$ , and  $348$ .

**Na<sub>2</sub>SiF<sub>6</sub> (aq.).** Thomsen<sup>15</sup> and Hantke<sup>1</sup> measured the heat of neutralization of H<sub>2</sub>SiF<sub>6</sub> (aq.) with 2 NaOH (aq.).

**NaHSiF<sub>6</sub> (aq.).** Thomsen<sup>15</sup> measured the heat of mixing H<sub>2</sub>SiF<sub>6</sub> (200) with NaOH (200).

**Na<sub>2</sub>SiF<sub>6</sub> (c).** The data of Hantke<sup>1</sup> yield  $S=-10.3$ . Truchot<sup>2</sup> measured the heat of reaction of SiF<sub>4</sub> (g) with 2 NaF (110).

**Na<sub>n</sub>Sn<sub>m</sub> (c).** Biltz and Holverscheit<sup>1</sup> measured the heats of solution, in HCl(8) containing FeCl<sub>3</sub> (aq.), of NaSn<sub>2</sub> (c), NaSn (c), Na<sub>4</sub>Sn<sub>3</sub> (c), Na<sub>2</sub>Sn (c), Na<sub>4</sub>Sn (c), and of their respective component parts.

**Na<sub>2</sub>SnO<sub>3</sub> (c).** Mixer<sup>7</sup> measured the heat of reaction of Sn (c) with 2 Na<sub>2</sub>O<sub>2</sub> (c).

**Na<sub>4</sub>SnO<sub>4</sub> (aq.).** Thomsen<sup>15</sup> measured the heat of mixing SnCl<sub>4</sub>(400) with 8 NaOH(100).

**Na<sub>2</sub>PbO<sub>3</sub> (c).** Mixer<sup>8</sup> measured the heat of reaction of Pb (c) with 2 Na<sub>2</sub>O<sub>2</sub> (c) and of PbO<sub>2</sub> (c) with Na<sub>2</sub>O (c). His data yield  $Q_f=202.4$  and  $203.2$ , respectively.

**2 NaI · PbI<sub>2</sub> · nH<sub>2</sub>O (c).** Mosnier<sup>1</sup> measured the heats of solution of the anhydrous salt, the tetrahydrate, and the hexahydrate.

**2 Na<sub>2</sub>S<sub>2</sub>O<sub>3</sub> · PbS<sub>2</sub>O<sub>3</sub> (aq.).** Fogh<sup>1</sup> measured the heat of mixing PbS<sub>2</sub>O<sub>3</sub> (c) with 2 Na<sub>2</sub>S<sub>2</sub>O<sub>3</sub> (aq.).

**2 Na<sub>2</sub>S<sub>2</sub>O<sub>3</sub> · PbS<sub>2</sub>O<sub>3</sub> (c).** Fogh<sup>1</sup> measured the heat of solution.

**Na<sub>2</sub>ZnO<sub>2</sub> (c).** Mixer<sup>11</sup> measured the heat of reaction of Zn (c) with Na<sub>2</sub>O<sub>2</sub> (c).

**Na<sub>2</sub>Zn(SO<sub>4</sub>)<sub>2</sub> · nH<sub>2</sub>O (c).** Graham<sup>3</sup> measured the heats of solution of the anhydrous salt and of the tetrahydrate.

**NaCd<sub>n</sub> (c).** Biltz and Haase<sup>1</sup> measured the heats of solution of Na (c), Cd (c), NaCd<sub>2</sub> (c), and NaCd<sub>5</sub> (c) in HCl(8).

**Na<sub>2</sub>CdO<sub>2</sub> (c).** Mixer<sup>15</sup> measured the heat of reaction of Cd (c) with Na<sub>2</sub>O<sub>2</sub> (c).

**NaHg<sub>n</sub> (liq.).** Berthelot<sup>56</sup> measured the heat of solution of NaHg<sub>25</sub> (liq.) in HCl(330); von Wartenberg<sup>8</sup> measured the heat of solution of Na (c) in 164 Hg (liq.). Their data yield, respectively, NaHg<sub>25</sub> (liq.),  $Q_f=19.6$ , and NaHg<sub>164</sub> (liq.),  $Q_f=20.2$ . The heat of dilution of NaHg<sub>n</sub> (liq.) with Hg (liq.) was measured by Cady<sup>1</sup> and Richards and Conant.<sup>1</sup>

**NaHg<sub>n</sub> (c).** Berthelot<sup>55</sup> measured the heat of solution of NaHg<sub>1.03</sub> (c) in water, and also (Berthelot<sup>56</sup>) of the solid amalgams, with  $n = 1.05, 2.15, 4.05$ , and  $6.0$ , in HCl(330). von Wartenberg<sup>8</sup> measured the heat of solution of Na<sub>3</sub>Hg (c) in Hg (liq.). Biltz and Meyer<sup>2</sup> measured the heats of solution, in HCl(8), of the solid amalgams, with  $n = \frac{1}{3}, \frac{2}{3}, 1, 1\frac{1}{2}, 2$ , and  $4$ .

**$n\text{NaBr} \cdot \text{HgBr}_2$  (aq.).** Varet<sup>6</sup> measured the heats of mixing HgBr<sub>2</sub> (4400) with 1, 2, 4, and 8 moles of NaBr(220), respectively.

**$4\text{Na}_2\text{S} \cdot \text{HgS}$  (aq.).** Berthelot<sup>115</sup> measured the heat of mixing 6 Na<sub>2</sub>S (aq.) with HgCl<sub>2</sub> (aq.).

**$n\text{NaCN} \cdot \text{Hg}(\text{CN})_2$  (aq.).** Varet<sup>2</sup> measured the heat of mixing Hg(CN)<sub>2</sub>(440) with 1 and 2 moles of NaCN(110), respectively.

**$n\text{NaX} \cdot \text{Hg}(\text{CN})_2$  (aq.).** Varet<sup>2</sup> measured the heat of mixing Hg(CN)<sub>2</sub> (440) with 1 and 2 moles of NaCl(110), NaBr(110), and NaI(110), respectively.

**$\text{NaX} \cdot \text{Hg}(\text{CN})_2 \cdot n\text{H}_2\text{O}$  (c).** Varet<sup>2</sup> measured the heats of solution of NaCl · Hg(CN)<sub>2</sub> ·  $1\frac{1}{2}$  H<sub>2</sub>O (c), NaBr · Hg(CN)<sub>2</sub> · 2 H<sub>2</sub>O (c), and NaI · Hg(CN)<sub>2</sub> · 2 H<sub>2</sub>O (c).

**$\text{Na}_2\text{O} \cdot \text{CuO}_2$  (c).** Mixter<sup>12</sup> measured the heat of reaction of Na<sub>2</sub>O<sub>2</sub> (c) with CuO (c).

**$\text{Na}_2\text{CO}_3 \cdot \text{CuCO}_3 \cdot n\text{H}_2\text{O}$  (c).** de Carli<sup>1</sup> measured the heats of solution of the anhydrous salt and the trihydrate in HCl(314).

**$\text{Na}_2\text{O}_2 \cdot \text{Ag}_2\text{O}$  (c).** Mixter<sup>12</sup> measured the heat of reaction of Na<sub>2</sub>O<sub>2</sub> (c) with Ag<sub>2</sub>O (c).

**$\text{Na}_3\text{Ag}(\text{S}_2\text{O}_3)_2$  (aq.).** Fogh<sup>1</sup> measured the heat of mixing AgNO<sub>3</sub> (110) with 5 Na<sub>2</sub>S<sub>2</sub>O<sub>3</sub>(220).

**$n\text{NaCN} \cdot \text{AgCN}$  (aq.).** Varet<sup>5</sup> measured the heats of dissolving AgCN (c) in NaCN(550), 2 NaCN(220), 2 NaCN(330), and 2 NaCN(1320), respectively.

**$\text{Na}_2\text{PtCl}_4$  (aq.).** Thomsen<sup>15</sup> measured the heat of reaction of Na<sub>2</sub>PtCl<sub>6</sub> (900) with 2 CuCl (c).

**$\text{Na}_2\text{PtCl}_6$  (aq.).** Thomsen<sup>15</sup> measured the heat of neutralization. His data yield  $N = 27.02_{1200}$ , with  $Q_f = 280.0$ . Thomsen<sup>15</sup> measured the heat of reaction of Na<sub>2</sub>PtCl<sub>6</sub> · 6 H<sub>2</sub>O (c) with 2 Co (c) in HCl (aq.); Gire,<sup>2</sup> that of Na<sub>2</sub>PtCl<sub>6</sub> (aq.) with 2 Co (c). Their data yield, respectively,  $Q_f = 280.6$  and  $285.9$ . The dissociation pressure data of Gire,<sup>1</sup> together with the heat of solution, yield  $Q_f = 278$ .

**$\text{Na}_2\text{PtCl}_6$  (c).** Thomsen<sup>15</sup> found  $S = 8.49_{800}^{17.6}$ ; Gire,<sup>2</sup>  $S = 7.09_{4200}^{17}$ .

**$\text{Na}_2\text{PtCl}_6 \cdot n\text{H}_2\text{O}$  (c).** Thomsen<sup>15</sup> measured the heats of solution of the dihydrate and the hexahydrate.

**$\text{Na}_2\text{PtBr}_6$  (aq.).** Thomsen<sup>15</sup> measured the heat of reaction of Na<sub>2</sub>PtBr<sub>6</sub> (aq.) with 2 Co (c).

**$\text{Na}_2\text{PtBr}_6 \cdot n\text{H}_2\text{O}$  (c).** Thomsen<sup>15</sup> measured the heats of solution of the anhydrous salt and the hexahydrate.

**$\text{Na}_2\text{PtI}_6$  (aq.).** Pigeon<sup>1</sup> measured the heats of reaction of Na<sub>2</sub>PtI<sub>6</sub> (aq.), and of 2 I<sub>2</sub> (c), with 2 Co (c) in NaI (aq.).

$\text{Na}_2\text{IrCl}_6$  (aq.). Ogawa<sup>1</sup> gave, for  $\text{Na}_2\text{IrCl}_6$  (aq.) +  $\text{NaCl}$  (aq.) +  $\text{Hg}$  (liq.) =  $\text{Na}_3\text{IrCl}_6$  (aq.) +  $\text{HgCl}$  (c),  $Q = 2.21$ .

$\text{Na}_3\text{RhCl}_6$  (aq.). Gire<sup>2</sup> measured the heat of reaction of  $\text{Na}_3\text{RhCl}_6$  (aq.) with  $1\frac{1}{2}$  Co (c).

$\text{Na}_3\text{RhCl}_6$  (c). Gire<sup>2</sup> found  $S = 7.83_{6000}^{19}$ . His data<sup>1</sup> on the dissociation pressure yield  $Qf = 353$ .

$\text{Na}_3\text{RhCl}_6 \cdot 12 \text{H}_2\text{O}$  (c). Gire<sup>2</sup> measured the heat of solution.

$\text{Na}_2\text{MnO}_4$  (c). Mixer<sup>11</sup> measured the heat of reaction of Mn (c) with 3  $\text{Na}_2\text{O}_2$  (c).

2  $\text{NaBr} \cdot \text{MnBr}_2$  (aq.). Varet<sup>6</sup> measured the heat of mixing  $\text{MnBr}_2$  (220) with 2  $\text{NaBr}$  (110).

$\text{Na}_2\text{SO}_4 \cdot \text{MnSO}_4 \cdot n\text{H}_2\text{O}$  (c). Graham<sup>3</sup> measured the heats of solution of the anhydrous salt and the dihydrate.

$\text{Na}_3\text{FeCO}(\text{CN})_5$  (aq.). Muller<sup>8</sup> found  $N = 41.6$ .

$\text{Na}_3\text{FeCO}(\text{CN})_5 \cdot n\text{H}_2\text{O}$  (c). Muller<sup>8</sup> measured the heats of solution of the anhydrous salt and the heptahydrate.

$\text{Na}_2\text{CoO}_3$  (c). Mixer<sup>11</sup> measured the heat of reaction of Co (c) with 2  $\text{Na}_2\text{O}_2$  (c).

2  $\text{NaBr} \cdot \text{CoBr}_2$  (aq.). Varet<sup>6</sup> measured the heat of mixing  $\text{CoBr}_2$  (220) with 2  $\text{NaBr}$  (110).

$\text{Na}_2\text{Ni}(\text{CN})_4$  (aq.). Varet<sup>6</sup> measured the heat of solution of  $\text{Ni}(\text{CN})_2$  (c) in 2  $\text{NaCN}$  (aq.).

$\text{Na}_2\text{CrO}_4$  (aq.). Thomsen<sup>15</sup> found  $N = 24.72_{800}^{18.9}$ ; Morges,<sup>1</sup>  $N = 23.68_{440}^{19.5}$ . Their data yield, respectively,  $\text{Na}_2\text{CrO}_4$  (800),  $Qf = 322.27$ , and  $\text{Na}_2\text{CrO}_4$  (440),  $Qf = 321.4$ .

$\text{Na}_2\text{CrO}_4 \cdot n\text{H}_2\text{O}$  (c). Berthelot<sup>95</sup> measured the heats of solution of the anhydrous salt, the tetrahydrate, and the decahydrate.

$\text{Na}_2\text{CrO}_4$  (10). The data of Berthelot<sup>51</sup> yield, for  $\text{Na}_2\text{CrO}_4 \cdot 10 \text{H}_2\text{O}$  (c),  $F = -12.3$ ; those of Morgan and Benson,<sup>1</sup>  $F = -15.2^{19.9}$ . We have selected  $F = -15.0$ , which yields the value of  $Qf$  for  $\text{Na}_2\text{CrO}_4$  (10).

$\text{Na}_2\text{Cr}_2\text{O}_7$  (aq.). Thomsen<sup>15</sup> and Morges<sup>1</sup> measured the heat of mixing  $\text{CrO}_3$  (aq.) with  $\text{NaOH}$  (aq.). Their data yield, respectively,  $\text{Na}_2\text{Cr}_2\text{O}_7$  (1200),  $Qf = 465.62$ , and  $\text{Na}_2\text{Cr}_2\text{O}_7$  (660),  $Qf = 465.54$ .

$\text{Na}_2\text{MoO}_4$  (aq.). Pechard<sup>1</sup> and Pissarjewsky<sup>2</sup> measured the heat of neutralization of  $\text{H}_2\text{MoO}_4$  (c) with  $\text{NaOH}$  (aq.), the latter using an excess of  $\text{NaOH}$  (aq.). Their data yield, respectively,  $\text{Na}_2\text{MoO}_4$  (880),  $Qf = 358.6$ , and  $\text{Na}_2\text{MoO}_4$  (440),  $Qf = 355.64$ . Pechard<sup>1</sup> performed a "double decomposition" experiment involving  $\text{Na}^+$ ,  $\text{MoO}_4^-$ ,  $\text{H}^+$ ,  $\text{SO}_4^-$ , his data yielding, for  $\text{Na}_2\text{MoO}_4$  (440),  $Qf = 358.4$ .

$\text{Na}_2\text{MoO}_4$  (c, II). Mixer<sup>10</sup> measured the heat of reaction of Mo (c) with 3  $\text{Na}_2\text{O}_2$  (c).

$\text{Na}_2\text{MoO}_4$  (c, I). Hare<sup>1</sup> measured the heat of transition.

$\text{Na}_2\text{WO}_4$  (aq.). Pissarjewsky<sup>2</sup> measured the heat of neutralization of  $\text{H}_2\text{WO}_4$  (c) with excess  $\text{NaOH}$  (aq.).

$\text{Na}_2\text{WO}_4$  (c, II). Mixer<sup>6</sup> measured the heat of reaction of W (c) with 3  $\text{Na}_2\text{O}_2$  (c).

$\text{Na}_2\text{WO}_4$  (c, I). Hare<sup>1</sup> measured the heat of transition.

$\text{NaVO}_5$  (aq.). Ruff and Friedrich<sup>1</sup> measured the heat of solution of  $\text{V}_2\text{O}_5$  (c) in  $(22\frac{3}{4} \text{ NaOH} + 8 \text{ H}_2\text{O}_2)$  (177).

$(\text{Na}_2\text{O}_2)_2 \cdot \text{UO}_4 \cdot 9 \text{ H}_2\text{O}$  (c). Pissarjewsky<sup>2</sup> measured the heat of solution of this hydrate in  $5 \text{ H}_2\text{SO}_4$  (55), and the heat of mixing  $(\text{UO}_2\text{SO}_4 + \text{H}_2\text{SO}_4)$  (aq.) with  $2 \text{ Na}_2\text{SO}_4$  (310).

$(\text{Na}_2\text{O}_2)_2 \cdot \text{UO}_4$  (c). Pissarjewsky<sup>2</sup> measured the heat of solution of  $(\text{Na}_2\text{O}_2)_2 \cdot \text{UO}_4 \cdot 9 \text{ H}_2\text{O}$  (c) in water.

$\text{Na}_2\text{U}_2\text{O}_7 \cdot 1\frac{1}{2} \text{ H}_2\text{O}$  (c). Pissarjewsky<sup>2</sup> measured the heat of solution of this hydrate in  $4 \text{ H}_2\text{SO}_4$  (55).

$\text{NaVO}_3$  (aq.). Matignon<sup>12</sup> measured the heat of reaction of  $\text{V}_2\text{O}_5$  (c) with  $2 \text{ NaOH}$  (aq.) to be 38.3 at  $15^\circ$ .

$\text{Na}_2\text{UO}_4$  (c). Mixer<sup>14</sup> measured the heats of the reactions,  $\text{U}$  (c) +  $3 \text{ Na}_2\text{O}_2$  (c) =  $\text{Na}_2\text{UO}_4$  (c) +  $2 \text{ Na}_2\text{O}$  (c),  $\text{UO}_3$  (c) +  $\text{Na}_2\text{O}$  (c) =  $\text{Na}_2\text{UO}_4$  (c),  $\text{UO}_2$  (c) +  $\text{Na}_2\text{O}_2$  (c) =  $\text{Na}_2\text{UO}_4$  (c), and  $\text{U}_3\text{O}_8$  (c) +  $\text{Na}_2\text{O}_2$  (c) +  $2 \text{ Na}_2\text{O}$  (c) =  $3 \text{ Na}_2\text{UO}_4$  (c), to be 341.8, 96.1, 110.9, and 285.1, respectively; whence, for  $\text{Na}_2\text{UO}_4$  (c),  $Q_f = 500.4, 487.2, 486.7$ , and  $482.8$ .

$n\text{NaCl} \cdot \text{ThCl}_4 \cdot m\text{H}_2\text{O}$  (c). Chauvenet<sup>2</sup> measured the heats of solution of  $2 \text{ NaCl} \cdot \text{ThCl}_4$  (c) and  $\text{NaCl} \cdot \text{ThCl}_4 \cdot 10 \text{ H}_2\text{O}$  (c).

$\text{NaBO}_2$  (aq.). Berthelot<sup>4</sup> measured the heat of mixing  $\text{H}_3\text{BO}_3$  (220) with  $\text{NaOH}$  (110); later, Berthelot<sup>13</sup> performed a "double decomposition" experiment with  $\text{Na}^+$ ,  $\text{BO}_2^-$ ,  $\text{H}^+$ ,  $\text{Cl}^-$ ; and again (Berthelot<sup>50</sup>) measured the heat of mixing  $\text{H}_3\text{BO}_3$  (220) with  $\text{NaOH}$  (110). His data yield, respectively, for  $\text{NaBO}_2$  (330),  $Q_f = 233.1, 233.4$ , and  $231.7$ . Thomsen<sup>15</sup> measured the heat of mixing  $\text{H}_3\text{BO}_3$  (150) with  $\text{NaOH}$  (150) and performed a "double decomposition" experiment involving  $\text{Na}^+$ ,  $\text{BO}_2^-$ ,  $\text{H}^+$ ,  $\text{SO}_4^-$ . His data yield, respectively,  $\text{NaBO}_2$  (300),  $Q_f = 231.6$ , and  $\text{NaBO}_2$  (150),  $Q_f = 232.1$ .

$\text{Na}_2\text{B}_4\text{O}_7$  (aq.). Berthelot<sup>4</sup> and Thomsen<sup>15</sup> measured the heat of mixing  $4 \text{ H}_3\text{BO}_3$  (aq.) with  $2 \text{ NaOH}$  (aq.). Their data yield, respectively,  $\text{Na}_2\text{B}_4\text{O}_7$  (1100),  $Q_f = 753.5$ , and  $\text{Na}_2\text{B}_4\text{O}_7$  (900),  $Q_f = 752.6$ .

$\text{Na}_2\text{B}_4\text{O}_7$  (c). Favre and Valson<sup>2</sup> measured the heat of solution.

$\text{Na}_2\text{B}_4\text{O}_7 \cdot 10 \text{ H}_2\text{O}$  (c). The data of Thomsen<sup>15</sup> yield  $S = -25.8_{1600}$ ; those of Favre and Valson<sup>2</sup>  $S = -22.2$ .

$\text{Na}_3\text{BO}_3$  (aq.). Thomsen<sup>15</sup> found  $N = 10.32_{600}^{18.3}$ .

$\text{Na}_3\text{BO}_3$  (c). Mixer<sup>6</sup> measured the heat of reaction of  $\text{B}_2\text{O}_3$  (c) with  $3 \text{ Na}_2\text{O}$  (c).

$\text{NaBO}_3 \cdot 4 \text{ H}_2\text{O}$  (c). Tanatar<sup>9</sup> found  $S = -11.56$  in water and  $S = -8.98$  in  $\text{H}_2\text{SO}_4$  (200).

$\text{NaAlO}_2$  (c). Mixer<sup>16</sup> measured the heat of reaction of  $\text{Al}_2\text{O}_3$  (c) with  $\text{Na}_2\text{O}$  (c).

$3 \text{ NaF} \cdot \text{AlF}_3$  (aq.). The data of Baud<sup>1</sup> yield the heat of mixing  $\text{AlF}_3$  (aq.) with  $3 \text{ NaF}$  (aq.).

$3 \text{ NaF} \cdot \text{AlF}_3 \cdot 3\frac{1}{2} \text{ H}_2\text{O}$  (c). Baud<sup>1</sup> measured the heat of mixing  $\text{AlF}_3$  (660) with  $3 \text{ NaF}$  (220) to form  $3 \text{ NaF} \cdot \text{AlF}_3 \cdot 3\frac{1}{2} \text{ H}_2\text{O}$  (c).

$3 \text{ NaF} \cdot \text{AlF}_3$  (c, II). Baud<sup>1</sup> measured the heats of solution of  $3 \text{ NaF} \cdot \text{AlF}_3$  (c) and of  $3 \text{ NaF} \cdot \text{AlF}_3 \cdot 3\frac{1}{2} \text{ H}_2\text{O}$  (c) in HF (aq.).

$3 \text{ NaF} \cdot \text{AlF}_3$  (c, I). Roth and Bertram<sup>1</sup> measured the heat of transition.

$3 \text{ NaF} \cdot \text{AlF}_3$  (liq.). Roth and Bertram<sup>1</sup> measured the heat of fusion.

$n \text{ NaCl} \cdot \text{AlCl}_3$  (c). Baud<sup>1</sup> measured the heats of solution of  $\text{NaCl} \cdot \text{AlCl}_3$  (c),  $3 \text{ NaCl} \cdot \text{AlCl}_3$  (c), and  $3 \text{ NaCl} \cdot 2 \text{ AlCl}_3$  (c).

$\text{NaAl}(\text{SO}_4)_2 \cdot 12 \text{ H}_2\text{O}$  (c). Ephraim and Wagner<sup>1</sup> measured the vapor pressure at various temperatures.

$\text{NaCl} \cdot \text{AlCl}_3 \cdot 6 \text{ NH}_3$  (c). Baud<sup>1</sup> measured the heat of solution.

$\text{Na}_2\text{O} \cdot \text{Al}_2\text{O}_3 \cdot n \text{ SiO}_2$  (c). Mulert<sup>1</sup> measured the heats of solution of  $\text{Na}_2\text{O} \cdot \text{Al}_2\text{O}_3 \cdot 3 \text{ SiO}_2$  (c, natrolite) and of  $\text{Na}_2\text{O} \cdot \text{Al}_2\text{O}_3 \cdot 4 \text{ SiO}_2$  (c, dehydrated analcite) in 20% HF (aq.).

$n \text{ Na}_2\text{SO}_4 \cdot \text{CaSO}_4 \cdot m \text{ H}_2\text{O}$  (c). Barre<sup>1</sup> measured the heats of solution of  $\text{CaSO}_4 \cdot \text{Na}_2\text{SO}_4$  (c),  $\text{CaSO}_4 \cdot 2 \text{ H}_2\text{O}$  (c) +  $\text{Na}_2\text{SO}_4$  (c),  $2 \text{ Na}_2\text{SO}_4 \cdot \text{CaSO}_4 \cdot 2 \text{ H}_2\text{O}$  (c), and  $2 \text{ Na}_2\text{SO}_4$  (c) +  $\text{CaSO}_4 \cdot 2 \text{ H}_2\text{O}$  (c).

$\text{NaSrPO}_4 \cdot 9 \text{ H}_2\text{O}$  (c). Joly<sup>4</sup> measured the heat of reaction of  $\text{Na}_3\text{PO}_4$  (aq.) with  $\text{SrCl}_2$  (aq.).

$\text{NaSrAsO}_4 \cdot 9 \text{ H}_2\text{O}$  (c). Joly<sup>4</sup> measured the heat of reaction of  $\text{Na}_3\text{AsO}_4$  (aq.) with  $\text{SrCl}_2$  (aq.).

$\text{NaBaPO}_4 \cdot 9 \text{ H}_2\text{O}$  (c). Joly<sup>4</sup> measured the heat of reaction of  $\text{Na}_3\text{PO}_4$  (aq.) with  $\text{BaCl}_2$  (aq.).

$\text{NaBaAsO}_4 \cdot 9 \text{ H}_2\text{O}$  (c). Joly<sup>4</sup> measured the heat of reaction of  $\text{Na}_3\text{AsO}_4$  (aq.) with  $\text{BaCl}_2$  (aq.).

$\text{NaLiClI}$  (c, melt). Beketoff<sup>8</sup> measured the heats of solution of the melt, of  $\text{LiCl}$  (c) +  $\text{NaI}$  (c), and of  $\text{LiI}$  (c) +  $\text{NaCl}$  (c).

## POTASSIUM

**K (c).** Standard state.

**K (liq.).** The data on the heat of fusion yield the following values: Joannis,<sup>2</sup>  $-0.61$ ; Rengade,<sup>4</sup>  $-0.574$ ; Bridgman,<sup>2</sup>  $-0.501$ .

**K (g).** The vapor pressure of potassium was measured by Kroner,<sup>1</sup> Fiock and Rodebush,<sup>1</sup> Edmondson and Egerton,<sup>1, 2</sup> and Killian.<sup>1</sup> See also van Laar<sup>9</sup> and Rodebush.<sup>2</sup> Following the same procedure as with sodium, we have calculated that the amount of  $\text{K}_2$  in potassium vapor at these temperatures is less than 1%. For the heat of vaporization of K (liq.), we have selected  $V = -20.00 + 0.0025(t + 273.1)$ ; whence, for K (g),  $Q_f = -19.80$ .

The values for the energy states of gaseous monatomic potassium are from Fowler,<sup>3</sup> de Bruin,<sup>1, 4</sup> and Bowen.<sup>1, 5</sup> See also Braunbek<sup>1</sup> and Bacher and Goudsmit.<sup>1</sup>

**K<sub>2</sub> (g).** Nusbaum and Loomis<sup>1</sup> and Loomis and Nusbaum<sup>2</sup> reported the energy of dissociation,  $\text{K}_2$  (g) =  $2 \text{ K}$  (g), with each substance in its normal state, to be  $0.51 \pm 0.02$  volt-electrons. See also Carelli and Pringsheim,<sup>1</sup> Crane and Christy,<sup>1</sup> and Ditchburn.<sup>1</sup> The values for the

energy states of gaseous diatomic potassium are from Mulliken.<sup>6</sup> See also Jevons.<sup>1</sup>

**KOH (aq.).** The heat of solution of K (c) in water was measured by Favre and Silbermann,<sup>3</sup> Thomsen,<sup>15</sup> Joannis,<sup>2</sup> and Rengade.<sup>1</sup> The data of the last three investigations yield for the reaction,  $K(c) + H_2O(liq.) = KOH(200) + \frac{1}{2}H_2(g)$ , the respective values,  $Q = 48.1 \pm 0.3$ ,  $45.83 \pm 0.28$ , and  $46.42 \pm 0.15$ . We have selected 46.4, whence for  $KOH(200)$ ,  $Q_f = 114.8$ . The heat of dilution of  $KOH(aq.)$  was measured by Berthelot,<sup>20</sup> Sabatier,<sup>1</sup> Thomsen,<sup>15</sup> de Forcrand,<sup>55</sup> Pratt,<sup>1</sup> and Richards and Rowe.<sup>2</sup> The data in the range from 25 to 400  $H_2O$  were reviewed by Rossini,<sup>5</sup> who gave values from  $\infty$  to 25  $H_2O$ . The other data have been utilized to obtain values from 25 to 3  $H_2O$ .

**$K^+(\infty)$ .** From the foregoing data we have computed, for  $K^+(\infty) + OH^-(\infty)$ ,  $Q_f = 114.930$ ; whence, for  $K^+(\infty)$ ,  $Q_f = 60.27$ .

**KOH (c, II).** The heat of solution data yield the following values for  $S_{200}$ : Berthelot,<sup>10</sup> 12.76; Thomsen,<sup>15</sup> 13.18; and de Forcrand,<sup>34</sup> 12.80.

**$KOH \cdot nH_2O(c)$ .** Berthelot<sup>20</sup> measured the heats of solution of the hydrates with  $\frac{1}{2}$  and 2 moles of  $H_2O$ ; de Forcrand,<sup>34</sup> those with 0.25, 0.535, 0.91, 1.16, and 1.55 moles of  $H_2O$ .

**KOH (c, I).** Hevesy<sup>1</sup> determined the heat of transition.

**KOH (g).** von Wartenberg and Albrecht<sup>1</sup> gave  $V = -32.45^{1500}$ .

**$K_2O(c)$ .** Rengade<sup>3</sup> measured the heats of solution of K (c) and  $K_2O(c)$ . The difference gives, for  $K_2O(c) + H_2(g) = 2K(c) + H_2O(liq.)$ ,  $Q = -17.8$ ; whence, for  $K_2O(c)$ ,  $Q_f = 86.2$ . Beketoff's<sup>2</sup> data on the heat of solution of  $K_2O(c)$ , yield  $Q_f = 94(?)$ .

**$K_2O_n(c)$ .** de Forcrand<sup>66</sup> measured the heats of solution of  $K_2O_3(c)$  and  $K_2O_4(c)$  in  $H_2SO_4(aq.)$ .

**KH (c).** Moutier<sup>1</sup> calculated the heat of dissociation from the dissociation pressure data of Troost and Hautefeuille.<sup>8</sup> Keyes<sup>1</sup> computed  $D$  from his data on the dissociation pressure. Kasarnowsky and Proskurnin<sup>1</sup> reported that Monossohn measured the heats of solution of K (c) and KH (c), and found, for the latter,  $Q_f = 8$  to 10. The data of Moutier and Keyes yield, respectively, for KH (c),  $Q_f = 14.7$  and 9.8.

**KF (aq.).** Guntz<sup>1</sup> and Mulert<sup>1</sup> measured the heat of neutralization of HF (aq.) with KOH (aq.). Their data yield, respectively,  $KF(400)$ ,  $Q_f = 138.12$ , and  $KF(80)$ ,  $Q_f = 140.7$ . Berthelot and Guntz<sup>2</sup> measured the heat of mixing  $HCl(110)$  with  $KF(110)$  and of  $HF(110)$  with  $KCl(110)$ ; whence, for  $KF(110)$ ,  $Q_f = 138.70$ . The heat of dilution was measured by Lange and Eichler,<sup>1</sup> Lange and Messner,<sup>2</sup> de Forcrand,<sup>53</sup> and Guntz.<sup>1</sup>

**KF (c).** The heat of solution data yield the following values for  $S_{200}$ : Guntz,<sup>1</sup> 3.60; de Forcrand,<sup>12, 53</sup> 4.20; and Lange and Eichler,<sup>1</sup> 3.85.

**KF (liq.).** According to Plato,<sup>2</sup> the heat of fusion is  $-6.27^{880}$

**KF (g).** The vapor pressure was measured by Ruff, Schmidt, and Mugdan<sup>1</sup> and von Wartenberg and Schultz.<sup>1</sup> See also van Laar.<sup>9</sup>

**$KF \cdot 2H_2O(c)$ .** The data on the heat of solution yield the following

values for  $S_{200}$ : Guntz<sup>1</sup>,  $-1.05$ ; de Forcrand,<sup>58</sup>  $-2.11$ ; and Lange and Eichler,<sup>1</sup>  $-1.96$ .

**KF · 4 H<sub>2</sub>O (c).** de Forcrand<sup>58</sup> measured the heat of solution.

**KHF<sub>2</sub> (aq.).** Guntz<sup>1</sup> measured the heat of mixing KOH (aq.) with 2 HF (aq.) and of HF (aq.) with KF (aq.), his data yielding, respectively, KHF<sub>2</sub> (aq.),  $Q_f = 213.38$ , and KHF<sub>2</sub>(400),  $Q_f = 213.53$ . Guntz<sup>1</sup> also measured the heat of dilution of KHF<sub>2</sub> (aq.) from 28 to 222 H<sub>2</sub>O. We have extrapolated his data to infinite dilution, assuming no dissociation of HF<sub>2</sub><sup>-</sup> (aq.).

**KHF<sub>2</sub> (c).** The data of Guntz<sup>1</sup> and de Forcrand<sup>60</sup> yield identical values for the heat of solution.

**KF ·  $n$ HF (c).** Guntz<sup>4</sup> measured the heats of solution of KF · 2 HF (c) and KF · 3 HF (c).

**KCl (aq.).** The heat of neutralization of HCl (aq.) with KOH (aq.) was measured by Hess,<sup>1, 5</sup> Andrews,<sup>2, 7, 11</sup> Favre and Silbermann,<sup>3</sup> Favre,<sup>3</sup> Berthelot,<sup>10, 19, 4, 84</sup> Thomsen,<sup>15</sup> Muller,<sup>1, 40</sup> Richards and Rowe,<sup>3</sup> and Gillespie, Lambert, and Gibson.<sup>1</sup> The data from the last two investigations were recomputed by Rossini,<sup>6</sup> giving  $N = 14.085_{201}$ . The heat of dilution of KCl (aq.) was measured by van Deventer and van der Stadt,<sup>1</sup> Scholz,<sup>3</sup> Stackelberg,<sup>1</sup> Varali-Thevenet,<sup>1</sup> Rümelin,<sup>1</sup> Bishop,<sup>1</sup> Brönsted,<sup>9</sup> Magie,<sup>1</sup> Colson,<sup>5</sup> Pratt,<sup>1</sup> Stearns and Smith,<sup>1</sup> Richards and Rowe,<sup>2</sup> Laksonen,<sup>1</sup> Mondain-Monval,<sup>3</sup> Wust and Lange,<sup>1</sup> Sandonnini and Gerosa,<sup>1</sup> Nernst and Orthmann,<sup>1, 2</sup> Harrison and Perman,<sup>1</sup> Nernst and Naudé,<sup>1</sup> Holluta and Werner,<sup>1</sup> Lange and Leighton,<sup>1</sup> and Partington and Soper.<sup>1</sup> The modern data on the dilute range were reviewed by Rossini,<sup>5</sup> who gave values from  $\infty$  to 25 H<sub>2</sub>O.

**KCl (c).** The data on the heat of solution of KCl (c) have been recomputed to give the following values for  $S_{200}$  (the value following the investigator's name shows the data before conversion to 18° and 200 H<sub>2</sub>O): Andrews,<sup>14</sup>  $-\dots$ ; Winkelmann,<sup>1</sup>  $-5.02_{132}^0$ ,  $-4.37$ ; Berthelot,<sup>10</sup>  $-4.19_{200}^{21}$ ,  $-4.31$ ; Rechenberg,<sup>1</sup>  $-4.43_{200}^{18.2}$ ,  $-4.44$ ; Ostwald,<sup>1</sup>  $-4.56_{278}^{17}$ ,  $-4.50$ ; Berthelot and Ilosvay,<sup>1</sup>  $-4.30_{104}^{18}$ ,  $-4.36$ ; Thomsen,<sup>15</sup>  $-4.427_{200}^{18}$ ,  $-4.427$ ; Pickering,<sup>7</sup>  $-4.480_{400}^{18}$ ,  $-4.467$ ; Scholz,<sup>1</sup>  $-5.28_{220}^0$ ,  $-4.48$ ; Stackelberg,<sup>1</sup>  $-4.291_{100}^{18}$ ,  $-4.362$ ; Varali-Thevenet,<sup>1</sup>  $-5.52_{415}^0$ ,  $-4.79$ ; Zemczuzny and Rambach,<sup>1</sup>  $-4.433_{100}^{18?}$ ,  $-4.45(?)$ ; Brönsted,<sup>9</sup>  $-4.404_{200}^{19.7}$ ,  $-4.466$ ; Haigh,<sup>1</sup>  $-4.321_{400}^{20-22}$ ,  $-4.44$ ; Colson,<sup>5</sup>  $-4.545_{220}^{17.9}$ ,  $-4.542$ ; Cohen, Helder mann, and Moesveld,<sup>1</sup>  $-4.398_{200}^{18}$ ,  $-4.398$ ; Laksonen,<sup>2</sup>  $-5.28_{220}^0$ ,  $-4.57$ ; Mondain-Monval,<sup>3</sup>  $-4.27_{100-200}^{18}$ ,  $-4.30$ ; Wust and Lange,<sup>1</sup>  $-4.123_{50}^{25}$ ,  $-4.500$ ; Gire,<sup>1</sup>  $-4.66_{250}^{11.5}$ ,  $-4.41$ ; Sandonnini and Gerosa,<sup>1</sup>  $-4.508_{214}^{18?}$ ,  $-4.51(?)$ ; Holluta and Werner,<sup>1</sup>  $-4.517_{90.3}^{18.5}$ ,  $-4.59$ ; Cohen and Kooy,<sup>1</sup>  $-4.373_{200}^{20}$ ,  $-4.447$ ; Partington and Soper,<sup>1</sup>  $-4.266_{180}^{25}$ ,  $-4.518$ ; Roth and Eymann,<sup>1</sup>  $-4.322_{150}^{21}$ ,  $-4.448$ ; Lange and Monheim,<sup>2</sup>  $-4.694_{500}^{12.5}$ ,  $-4.453$ ; Agostini,<sup>1</sup>  $-4.314_{300}^?$  and  $-4.32_{300}^?$ ,  $(?)$ . We have selected as the best value for  $S_{200}$ , the average of those from the data of Cohen and Kooy,  $-4.447$ , Roth and Eymann,  $-4.448$ , and Lange and Monheim,  $-4.453$ .

There is an old value by Andrews<sup>16</sup> for the heat of the reaction  $\text{K (c)} + \frac{1}{2} \text{Cl}_2 \text{ (g)} = \text{KCl (c)}$ .

**KCl (liq.).** The data on the heat of fusion are: Zemczuzny and Rambach,<sup>1</sup> -4.69; Plato,<sup>1</sup> -6.41.

**KCl (g).** The vapor pressure was measured by Hackspill and Grandadam,<sup>1</sup> Fiock and Rodebush,<sup>1</sup> Horiba and Baba,<sup>1</sup> Jackson and Morgan,<sup>1</sup> Ruff and Mugdan,<sup>1</sup> and von Wartenberg and Albrecht.<sup>1</sup> We have taken  $V = -38.4^{1200}$ . From the spectral absorption limit, Franck, Kuhn, and Rollefson<sup>1</sup> calculated, for  $\text{KCl (g)}$ ,  $D^\circ = -103$ .

**KClO (aq.).** Berthelot<sup>151</sup> measured the heat of reaction of  $\text{KOH (aq.)}$  with  $\text{HClO (aq.)}$ , and also (Berthelot<sup>26</sup>) of  $2 \text{KOH (aq.)}$  with  $\text{Cl}_2 \text{ (aq.)}$ . Neumann and Muller<sup>2</sup> performed similar experiments. Their data yield the following values, respectively, for  $\text{KClO (aq.)}$ , 85.81, 86.74, 86.36, and 85.44.

**KClO<sub>3</sub> (aq.).** From the ions, we have computed, for  $\text{KClO}_3(\infty)$ ,  $Q_f = 81.02$ . The data of Stackelberg<sup>1</sup> give the heat of dilution from 125 to  $\infty \text{ H}_2\text{O}$ . We have estimated the values to  $\infty \text{ H}_2\text{O}$ .

**KClO<sub>3</sub> (c).** The data on the heat of solution yield the following values for  $S_{400}$ : Berthelot,<sup>10</sup> -9.36; Thomsen,<sup>15</sup> -10.18; Stackelberg,<sup>1</sup> -10.15. Frankland<sup>1</sup> measured, in a bomb calorimeter, the heat of decomposition of  $\text{KClO}_3 \text{ (c)}$  into  $\text{KCl (c)}$  and  $\text{O}_2 \text{ (g)}$ . Thomsen<sup>15</sup> also determined the heat of decomposition of  $\text{KClO}_3 \text{ (c)}$ , his data yielding  $Q_f = 94.65$ .

**KClO<sub>4</sub> (c).** Berthelot and Vielle<sup>4</sup> determined the heat of decomposition of  $\text{KClO}_4 \text{ (c)}$  into  $\text{KCl (c)}$  and  $\text{O}_2 \text{ (g)}$ , in a bomb calorimeter using potassium picrate and ammonium picrate as the auxiliary combustibles. Their data yield, for  $\text{KClO}_4 \text{ (c)}$ ,  $Q_f = 110.9$  and  $113.0$ , respectively.

**KClO<sub>4</sub> (aq.).** The heat of solution data have been recomputed to give the following values for  $S$ : Berthelot,<sup>79</sup> -11.54<sub>300</sub>; Stackelberg,<sup>1</sup> -12.30<sub>1000</sub>, and -11.81<sub>500</sub>; Noyes and Samet,<sup>1</sup> -12.27<sub>460</sub>; and Latimer and Ahlberg,<sup>1</sup> -12.62<sub>1800</sub>. We have estimated the heat of dilution from 200 to  $\infty \text{ H}_2\text{O}$ , utilizing the data on the heat of solution, which were obtained at various concentrations.

**KBr (aq.).** The heat of neutralization of  $\text{HBr (aq.)}$  with  $\text{KOH (aq.)}$  was measured by Berthelot,<sup>19</sup> Thomsen,<sup>15</sup> and Richards and Rowe.<sup>3</sup> The data of Richards and Rowe have been recomputed, giving  $N = 14.061_{201}$ . Data on the heat of dilution were reported by Wust and Lange,<sup>2</sup> Rümelin,<sup>1</sup> Dunnington and Hoggard,<sup>1</sup> and Berthelot.<sup>83</sup>

**KBr (c).** The data on the heat of solution have been recomputed, giving the following values for  $S_{200}$ : Berthelot,<sup>10</sup> -5.15; Berthelot and Ilosvay,<sup>1</sup> -5.01; Thomsen,<sup>15</sup> -5.091; Scholz,<sup>1</sup> -5.07; Brönsted,<sup>4</sup> -5.110; Walden,<sup>3</sup> -5.085; and Wust and Lange,<sup>2</sup> -5.119.

**KBr (liq.).** The value for the heat of fusion has been estimated.

**KBr (g).** The vapor pressure of  $\text{KBr}$  was measured by Fiock and Rodebush,<sup>1</sup> von Wartenberg and Albrecht,<sup>1</sup> and Ruff and Mugdan.<sup>1</sup> We have taken Fiock and Rodebush's value,  $V = -40.1^{1000}$ . See also Sommer-meyer<sup>1</sup> and Franck, Kuhn, and Rollefson.<sup>1</sup>

**KBrO (aq.).** Thomsen<sup>15</sup> measured the heat of reaction between  $\text{Br}_2$  (1400) and 2 KOH (40). His data yield, for KBrO (aq.),  $Q_f = 81.70$ . Berthelot's<sup>81</sup> data on the reaction between bromine and aqueous KOH are apparently uncertain.

**KBrO<sub>3</sub> (aq.).** Thomsen found  $N = 13.77_{801}$ . The heat of dilution from 200 to  $\infty$   $\text{H}_2\text{O}$  has been estimated.

**KBrO<sub>3</sub> (c).** The heat of solution data yield the following values for  $S_{400}$ : Berthelot,<sup>45</sup>  $-9.32$ ; Thomsen,<sup>15</sup>  $-10.12$ ; and Stackelberg,<sup>1</sup>  $-9.87$ .

**KI (aq.).** The heat of neutralization of HI (aq.) with KOH (aq.) was measured by Berthelot,<sup>19</sup> Thomsen,<sup>15</sup> and Richards and Rowe.<sup>3</sup> The data of Richards and Rowe have been recomputed, giving  $N = 13.975_{201}$ . The heat of dilution was measured by Wust and Lange<sup>2</sup> and Dunnington and Hoggard.<sup>1</sup>

**KI (c).** The data on the heat of solution yield the following values for  $S_{200}$ : Berthelot,<sup>10</sup>  $-5.00$ ; Berthelot and Ilosvay,<sup>1</sup>  $-4.99$ ; Thomsen,<sup>15</sup>  $-5.197$ ; Scholz,<sup>1</sup>  $-5.05$ ; Walden,<sup>3</sup>  $-5.206$ ; and Wust and Lange,<sup>2</sup>  $-5.168$ . We have selected as the best value the average of those of Thomsen, Walden, and Wust and Lange.

**KI (g).** Vapor pressure data were reported by Fiock and Rodebush,<sup>1</sup> Ruff and Mugdan,<sup>1</sup> and von Wartenberg and Albrecht.<sup>1</sup> See also Mayer,<sup>3</sup> Weinberg,<sup>2</sup> and Reis.<sup>1</sup> We have selected  $V = -37.6^{900}$ . From Franck, Kuhn, and Rollefson's<sup>1</sup> value for  $\text{KI (g)} = \text{K (g)} + \text{I (g)}$ , calculated from the spectral absorption limit, we have computed, for KI (g),  $Q_f = 30.3$ ; while from Mayer's<sup>3</sup> value for  $\text{KI (g)} = \text{K}^+ \text{(g)} + \text{I}^- \text{(g)}$ , we have computed, for KI (g),  $Q_f = 28.2$ . See also Sommermeyer.<sup>1</sup>

**KI (methyl alcohol, ethyl alcohol, acetonitrile, acetone).** Walden<sup>3</sup> measured the heat of solution of KI (c) in these liquids.

**KI<sub>3</sub> (c).** Berthelot<sup>64</sup> measured the heat of solution of KI<sub>3</sub> (c) and of KI (c) in  $\text{H}_2\text{O}$ , and of I<sub>2</sub> (c) in KI (aq.).

**KIO<sub>3</sub> (aq.).** Berthelot<sup>42</sup> and Thomsen<sup>15</sup> measured the heat of neutralization of HIO<sub>3</sub> (aq.) with KOH (aq.). Their data yield, respectively,  $N = 14.10_{440}$  and  $13.80_{800}$ , giving, for KIO<sub>3</sub> (800),  $Q_f = 115.00$  and  $114.85$ . From Berthelot's<sup>45</sup> measurement of the heat of reaction of 3 I<sub>2</sub> (c) with 6 KOH (220), we have calculated, for KIO<sub>3</sub> (aq.),  $Q_f = 114.5$ . Some few data on the heat of dilution of KIO<sub>3</sub> (aq.), from 110 to 500  $\text{H}_2\text{O}$ , were reported by Berthelot<sup>45</sup> and Stackelberg.<sup>1</sup> We have estimated the values to 100  $\text{H}_2\text{O}$  and to infinite dilution.

**KIO<sub>3</sub> (c).** The data on the heat of solution yield the following values for  $S_{400}$ : Berthelot,<sup>45</sup>  $-5.57$ ; Thomsen,<sup>15</sup>  $-6.78$ ; and Stackelberg,<sup>1</sup>  $-6.61$ .

**KIO<sub>4</sub> (aq.).** The data of Thomsen<sup>15</sup> yield  $N = 5.13_{1200}$ .

**KH<sub>4</sub>IO<sub>6</sub>, K<sub>2</sub>H<sub>3</sub>IO<sub>6</sub>, K<sub>3</sub>H<sub>2</sub>IO<sub>6</sub> (aq.).** Thomsen<sup>15</sup> measured the heat of mixing  $\text{H}_5\text{IO}_6$  (600) with 1, 2, and 3 moles of KOH (600), respectively.

**KIO<sub>3</sub> · HIO<sub>3</sub> (aq.).** Thomsen<sup>15</sup> measured the heat of mixing KIO<sub>3</sub> (800) with HIO<sub>3</sub> (800).

**KIO<sub>3</sub> · HIO<sub>3</sub> (c).** Berthelot<sup>45</sup> measured the heat of solution.

**KI · KCl (c, fresh melt).** Beketoff<sup>8</sup> measured the heats of solution of the fresh melt and of KCl (c) + KI (c).

**K<sub>2</sub>S (aq.).** Sabatier<sup>1</sup> measured the heat of neutralization of 2 KOH (200) with H<sub>2</sub>S (g). His data yield, for K<sub>2</sub>S(400),  $Q_f = 110.4$ . Sabatier<sup>1</sup> measured the heat of dilution from 7 to 400 H<sub>2</sub>O. We have estimated the heat of dilution from 400 to  $\infty$  H<sub>2</sub>O to be zero.

**K<sub>2</sub>S (c).** Sabatier<sup>1</sup> found  $S = 10_{580}$ , Favre and Silbermann,<sup>3</sup>  $S = 10.6$ , Rengade and Costeanu,<sup>1</sup>  $S = 22.6_{400}$ ?

**K<sub>2</sub>S · nH<sub>2</sub>O (c).** Sabatier<sup>1</sup> measured the heats of solution of the dihydrate and the pentahydrate.

**K<sub>2</sub>S<sub>n</sub> (aq.).** Sabatier<sup>1</sup> measured the heats of reaction of I<sub>2</sub> (c) with K<sub>2</sub>S<sub>3/4</sub> (aq.), and K<sub>2</sub>S<sub>4</sub> (aq.), respectively.

**K<sub>2</sub>S<sub>3/4</sub> (c).** Sabatier<sup>1</sup> measured the heat of solution.

**K<sub>2</sub>S<sub>4</sub> · nH<sub>2</sub>O (c).** Sabatier<sup>1</sup> measured the heats of solution of the anhydrous salt, the hemihydrate, and the dihydrate.

**KHS (aq.).** Sabatier<sup>1</sup> measured the heat of reaction of H<sub>2</sub>S (aq.) with KOH (aq.), and of KHS (aq.) with KOH (aq.). His data yield, for KHS(200),  $Q_f = 64.07$  and  $64.47$ , respectively. The heat of dilution was measured by Sabatier<sup>1</sup> from 2.8 to 200 H<sub>2</sub>O. We have estimated the value to  $\infty$  H<sub>2</sub>O, assuming no dissociation of HS<sup>-</sup> (aq.).

**KHS · nH<sub>2</sub>O (c).** Sabatier<sup>1</sup> measured the heats of solution of KHS (c) and KHS ·  $\frac{1}{4}$  H<sub>2</sub>O (c).

**K<sub>2</sub>SO<sub>4</sub> (aq.).** Berthelot<sup>4, 7</sup> and Thomsen<sup>15</sup> each measured the heat of neutralization of H<sub>2</sub>SO<sub>4</sub> (aq.) with KOH (aq.), and performed a number of pairs of "double decomposition" experiments involving K<sub>2</sub>SO<sub>4</sub> (aq.). Muller<sup>10</sup> measured the heat of neutralization of H<sub>2</sub>SO<sub>4</sub>(55) with KOH (aq.) of various concentrations. Brönsted,<sup>10</sup> from electromotive force measurements, obtained the heat of the reaction, KCl (c) +  $\frac{1}{2}$  Na<sub>2</sub>SO<sub>4</sub> (c) = NaCl (c) +  $\frac{1}{2}$  K<sub>2</sub>SO<sub>4</sub> (c), whence, by using the heat of solution of K<sub>2</sub>SO<sub>4</sub> (c), we have obtained a value for K<sub>2</sub>SO<sub>4</sub> (aq.). The foregoing data have been recomputed to give the following values for K<sub>2</sub>SO<sub>4</sub>(400): Berthelot, neutralization, 336.46; Berthelot, "double decomposition," K<sup>+</sup>, SO<sub>4</sub><sup>-</sup>, Na<sup>+</sup>, OH<sup>-</sup>, 336.25; Berthelot, "double decomposition," K<sup>+</sup>, SO<sub>4</sub><sup>-</sup>, H<sup>+</sup>, Cl<sup>-</sup>, 337.05; Berthelot, "double decomposition," K<sup>+</sup>, SO<sub>4</sub><sup>-</sup>, H<sup>+</sup>, NO<sub>3</sub><sup>-</sup>, 336.01; Berthelot, "double decomposition," K<sup>+</sup>, SO<sub>4</sub><sup>-</sup>, Na<sup>+</sup>, Cl<sup>-</sup>, 336.37; Berthelot, "double decomposition," K<sup>+</sup>, SO<sub>4</sub><sup>-</sup>, Na<sup>+</sup>, NO<sub>3</sub><sup>-</sup>, 335.91; Thomsen, neutralization, 336.05; Thomsen, "double decomposition," K<sup>+</sup>, SO<sub>4</sub><sup>-</sup>, H<sup>+</sup>, NO<sub>3</sub><sup>-</sup>, 336.69; Thomsen, "double decomposition," K<sup>+</sup>, SO<sub>4</sub><sup>-</sup>, Na<sup>+</sup>, OH<sup>-</sup>, 336.12; Thomsen, "double decomposition," K<sup>+</sup>, SO<sub>4</sub><sup>-</sup>, H<sup>+</sup>, Cl<sup>-</sup>, 336.56; Thomsen, "double decomposition," K<sup>+</sup>, SO<sub>4</sub><sup>-</sup>, H<sup>+</sup>, Cl<sup>-</sup>, 336.33; Muller, neutralization, 336.58; Brönsted,  $Q_f$  of solid + heat of solution, 336.44. There are old values of the heat of neutralization by Hess,<sup>5</sup> Andrews,<sup>7, 2</sup> Favre and Silbermann,<sup>3</sup> and Favre.<sup>3</sup> The heat of dilution of K<sub>2</sub>SO<sub>4</sub> (aq.) was measured by Lange and Streeck,<sup>1</sup> Mondain-Monval,<sup>3</sup> Brönsted,<sup>9</sup> Rümelin,<sup>1</sup> Varali-Thevenet,<sup>1</sup> and Scholz.<sup>1</sup>

**K<sub>2</sub>SO<sub>4</sub> (c, II).** The data on the heat of solution yield the following values for  $S_{400}$ : Favre and Silbermann,<sup>3</sup> (?); Favre,<sup>8</sup> (?); Berthelot,<sup>10</sup> (?); Berthelot and Ilosvay,<sup>1</sup> (?); Tilden,<sup>2</sup> -6.13; Pickering,<sup>2</sup> -6.54; Thomsen,<sup>15</sup> -6.33; Scholz,<sup>1</sup> -6.72; Varali-Thevenet,<sup>1</sup> -6.76; Brönsted,<sup>9</sup> -6.38; Mondain-Monval,<sup>3</sup> -6.60 (?); Cohen and Kooy,<sup>1</sup> -6.444. We have taken the average of the values from Pickering, Thomsen, Brönsted, and Cohen and Kooy.

**KHSO<sub>4</sub> (aq.).** Berthelot<sup>6</sup> and Thomsen<sup>15</sup> measured the heat of mixing H<sub>2</sub>SO<sub>4</sub> (aq.) with K<sub>2</sub>SO<sub>4</sub> (aq.). Their data yield, for KHSO<sub>4</sub>(200),  $Qf = 273.02$  and  $273.20$ , respectively. The heat of dilution of KHSO<sub>4</sub> (aq.) was measured by Berthelot<sup>6</sup> and Thomsen.<sup>15</sup>

**KHSO<sub>4</sub> (c, III).** The data on the heat of solution yield the following values for  $S_{200}$ : Graham,<sup>2</sup> (?); Favre,<sup>8</sup> (?); Berthelot,<sup>10</sup> -3.0 (?); Thomsen,<sup>15</sup> -3.75.

**KHSO<sub>4</sub> (c, II), KHSO<sub>4</sub> (c, I).** Bridgman<sup>7</sup> determined the heats of transition.

**KHSO<sub>3</sub> (aq.).** Berthelot<sup>92</sup> measured the heat of mixing H<sub>2</sub>SO<sub>3</sub>(275) with KOH(110). His data yield, for KHSO<sub>3</sub>(385),  $Qf = 209.70$ .

**K<sub>2</sub>SO<sub>4</sub> (c, I).** Hare<sup>1</sup> measured the heat of transition.

**K<sub>2</sub>SO<sub>3</sub> (aq.).** Berthelot<sup>92</sup> measured the heat of neutralization of H<sub>2</sub>SO<sub>3</sub> (aq.) with KOH (aq.). His data yield, for K<sub>2</sub>SO<sub>3</sub>(500),  $Qf = 271.2$ .

**K<sub>2</sub>SO<sub>3</sub> (c).** Berthelot<sup>92</sup> measured the heat of solution. The data of Martin and Metz,<sup>1</sup> who measured the heat of reaction, in a bomb calorimeter, between K<sub>2</sub>SO<sub>3</sub> (c), Mg (c), and O<sub>2</sub> (g), yield  $Qf = 273$ .

**K<sub>2</sub>SO<sub>3</sub> · H<sub>2</sub>O (c).** Berthelot<sup>92</sup> measured the heat of solution.

**K<sub>2</sub>S<sub>2</sub>O<sub>5</sub> · *n*H<sub>2</sub>O (c).** Berthelot<sup>94</sup> measured the heats of solution of the anhydrous salt and the hemihydrate.

**K<sub>2</sub>S<sub>2</sub>O<sub>3</sub> (c).** Berthelot<sup>93</sup> measured the heat of solution. The data of Martin and Metz,<sup>1</sup> who measured, in a bomb calorimeter, the heat of the reaction, K<sub>2</sub>S<sub>2</sub>O<sub>3</sub> (c) + Mg (c) + 2½ O<sub>2</sub> (g) = K<sub>2</sub>SO<sub>4</sub> (c) + MgSO<sub>4</sub> (c), yield  $Qf = 283$ .

**K<sub>2</sub>S<sub>2</sub>O<sub>6</sub> (c).** The data of Martin and Metz<sup>1</sup> (see K<sub>2</sub>S<sub>2</sub>O<sub>3</sub> (c)) yield  $Qf = 415.8$ . The data of Thomsen<sup>15</sup> on the reaction, K<sub>2</sub>S<sub>2</sub>O<sub>6</sub> (c) = K<sub>2</sub>SO<sub>4</sub> (c) + SO<sub>2</sub> (g), yield  $Qf = 413.7$ .

**K<sub>2</sub>S<sub>2</sub>O<sub>6</sub> (aq.).** Thomsen<sup>15</sup> measured the heat of solution of K<sub>2</sub>S<sub>2</sub>O<sub>6</sub> (c).

**K<sub>2</sub>S<sub>2</sub>O<sub>7</sub> (c).** Berthelot<sup>4</sup> measured the heat of solution of K<sub>2</sub>S<sub>2</sub>O<sub>7</sub> (c) in H<sub>2</sub>O to form 2 KHSO<sub>4</sub> (aq.).

**K<sub>2</sub>S<sub>2</sub>O<sub>7</sub> (aq.).** Berthelot<sup>4</sup> measured the heat of solution of K<sub>2</sub>S<sub>2</sub>O<sub>7</sub> (c) in H<sub>2</sub>O, taking the initial heat of solution, i. e., before S<sub>2</sub>O<sub>7</sub><sup>-</sup> (aq.) was hydrated to 2 HSO<sub>4</sub><sup>-</sup> (aq.).

**K<sub>2</sub>S<sub>2</sub>O<sub>8</sub> (aq.).** The value of  $Qf$  for this substance is computed from those for the aqueous ions.

**K<sub>2</sub>S<sub>2</sub>O<sub>8</sub> (c).** Berthelot<sup>107</sup> measured the heat of solution.

**K<sub>2</sub>S<sub>3</sub>O<sub>6</sub> (c).** Berthelot<sup>103</sup> measured the heat of reaction of K<sub>2</sub>S<sub>3</sub>O<sub>6</sub> (c) with KBr<sub>3</sub> (aq.). His data yield  $Qf = 411.2$ . The data of Martin and Metz<sup>1</sup> (see K<sub>2</sub>S<sub>2</sub>O<sub>3</sub> (c)) yield  $Qf = 402$ .

$\text{K}_2\text{S}_3\text{O}_6$  (aq.). The data of Berthelot<sup>103</sup> and Thomsen<sup>15</sup> yield, respectively,  $S = -12.45_{650}$  and  $-12.38_{500}$ .

$\text{K}_2\text{S}_4\text{O}_6$  (c). The data of Martin and Metz<sup>1</sup> (see  $\text{K}_2\text{S}_2\text{O}_3$  (c)) yield  $Qf = 393$ . Thomsen<sup>15</sup> measured the heat of solution.

$\text{K}_2\text{S}_4\text{O}_6$  (aq.). This value is obtained from those for the aqueous ions.

$\text{K}_2\text{S}_5\text{O}_6$  (aq.). Berthelot<sup>103</sup> measured the heat of reaction of  $\text{K}_2\text{S}_5\text{O}_6$  (aq.) with 10  $\text{KBr}_3$  (aq.), and also of  $\text{K}_2\text{S}_5\text{O}_6$  (aq.) with 3  $\text{NaOH}$  (aq.). His data yield, respectively,  $Qf = 398.1$  and  $400.7$ .

$\text{K}_2\text{S}_5\text{O}_6$  (c). The data of Martin and Metz<sup>1</sup> (see  $\text{K}_2\text{S}_2\text{O}_3$  (c)) yield  $Qf = 386$ . We have estimated 408.

$\text{K}_2\text{S}_5\text{O}_6 \cdot 1\frac{1}{2} \text{H}_2\text{O}$  (c). Berthelot<sup>103</sup> measured the heat of solution.

$\text{KI} \cdot 4 \text{SO}_2$  (c). Ephraim and Kornblum<sup>1</sup> found  $D = -9.67$ .

$\text{K}_2\text{Se}$  (aq.). Fabre<sup>1</sup> measured the heat of reaction of  $\text{H}_2\text{S}$  (g) with 2  $\text{KOH}$  (220), and of  $\text{H}_2\text{S}$  (4000) with 2  $\text{KOH}$  (220). His data yield, for  $\text{K}_2\text{Se}$  (440),  $Qf = 82.72$ , and for  $\text{K}_2\text{Se}$  (4400),  $Qf = 83.76$ .

$\text{K}_2\text{Se} \cdot n\text{H}_2\text{O}$  (c). Fabre<sup>1</sup> measured the heats of solution of the anhydrous salt and of the hydrates, with 9, 14, and 19 moles of  $\text{H}_2\text{O}$ .

$\text{KHSe}$  (aq.). The data of Fabre,<sup>1</sup> who measured the heat of mixing  $\text{KOH}$  (aq.) with  $\text{H}_2\text{Se}$  (4000), yield, for  $\text{KHSe}$  (4200),  $Qf = 34.03$ .

$\text{K}_2\text{SeO}_4$  (aq.). The data of Metzner<sup>2, 1</sup> yield  $N = 31.19_{440}$ , whence for  $\text{K}_2\text{SeO}_4$  (440),  $Qf = 266.95$ . We have estimated the heat of dilution to  $\infty \text{H}_2\text{O}$ .

$\text{KHSeO}_4$  (aq.). Metzner<sup>2, 1</sup> found, for the heat of mixing  $\text{H}_2\text{SeO}_4$  (220) with  $\text{K}_2\text{SeO}_4$  (220),  $Q^{15} = -1.24$ .

$\text{K}_2\text{TeO}_3$  (aq.). Metzner<sup>1, 2</sup> found, for the heat of solution of  $\text{TeO}_2$  (c) in  $\text{KOH}$  (aq.),  $Q^{15} = 22.76$ .

$\text{K}_2\text{TeO}_4$  (aq.). The data of Metzner<sup>1, 2</sup> yield  $N = 31.24_{220}$ .

$\text{KNO}_3$  (aq.). The heat of neutralization of  $\text{HNO}_3$  (aq.) with  $\text{KOH}$  (aq.) was measured by Hess,<sup>6</sup> Andrews,<sup>2, 7, 11</sup> Favre and Silbermann,<sup>3</sup> Favre,<sup>3</sup> Berthelot,<sup>4</sup> Thomsen,<sup>15</sup> and Richards and Rowe.<sup>3</sup> The data of Richards and Rowe were recomputed by Rossini,<sup>6</sup> giving  $N = 14.165_{201}$ . Data on the heat of dilution of  $\text{KNO}_3$  (aq.) were given by Winklemann,<sup>1</sup> Scholz,<sup>1</sup> Stackelberg,<sup>1</sup> Varali-Thevenet,<sup>1</sup> Rümelin,<sup>1</sup> Bishop,<sup>1</sup> Colson,<sup>5</sup> Pratt,<sup>1</sup> Richards and Rowe,<sup>2</sup> Mondain-Monval,<sup>3</sup> Nernst and Orthmann,<sup>1</sup> Nernst and Naudé,<sup>1</sup> Roth,<sup>11</sup> Roth and Eymann,<sup>1</sup> Roth and Muller,<sup>5</sup> and Lange and Monhein.<sup>2</sup> The modern data in the dilute range were reviewed by Rossini,<sup>5</sup> who gave values from  $\infty$  to  $25 \text{H}_2\text{O}$ .

$\text{KNO}_3$  (c, III). The data on the heat of solution have been recomputed to give the following values for  $S_{200}$ : Person,<sup>6</sup> (?); Winkelmann,<sup>1</sup>  $-8.42$ ; Berthelot,<sup>10</sup> (?); Tilden,<sup>2</sup>  $-8.12$ ; Thomsen,<sup>15</sup>  $-8.49$ ; Pickering,<sup>7</sup>  $-8.41$ ; Scholz,<sup>1</sup>  $-8.51$ ; Stackelberg,<sup>1</sup>  $-8.43$ ; Varali-Thevenet,<sup>1</sup>  $-8.28$ ; Haigh,<sup>1</sup>  $-8.28$ ; Colson,<sup>5</sup>  $-8.65$ ; Mondain-Monval,<sup>3</sup>  $-8.3$ ; Holluta and Werner,<sup>1</sup>  $-8.57$ ; Berenger-Calvet,<sup>1</sup>  $-8.25$ ; Zawidski and Schogger,<sup>1</sup> (?); Roth,<sup>11</sup>  $-8.282$ ; Roth and Muller,<sup>5</sup>  $-8.467$ ; Cohen and Kooy,<sup>1</sup>  $-8.395$ ; Roth and Eymann,<sup>1</sup>  $-8.399$ ; Lange and Monhein,<sup>1</sup>  $-8.404$ . We have taken the average of the last three values.

**KNO<sub>3</sub> (c, II), KNO<sub>3</sub> (c, I).** Potassium nitrate shows a change of crystal form at about 128°. According to Bridgeman's<sup>6a</sup> analysis, there are really two transitions with  $T=0.62_{\text{I} \rightarrow \text{II}}^{128}$  and  $1.17_{\text{II} \rightarrow \text{III}}^{128}$ . See also Bellati and Romanese.<sup>3</sup>

**KNO<sub>3</sub> (liq.).** Data for obtaining the heat of fusion were recorded by Person<sup>1</sup> and Goodwin and Kalmus.<sup>1</sup>

**KNH<sub>3</sub> (c).** Joannis<sup>3</sup> found  $D = -6.4$ .

**KX · nNH<sub>3</sub> (c).** Biltz and Hansen<sup>1</sup> measured the temperature coefficient of the dissociation pressure for KBr · 4NH<sub>3</sub> (c), KI · 4NH<sub>3</sub> (c), and KI · 6NH<sub>3</sub> (c).

**KH<sub>2</sub>PO<sub>4</sub> (c).** Graham<sup>1</sup> measured the heat of solution.

**KH<sub>2</sub>AsO<sub>4</sub> (c).** Graham<sup>1</sup> measured the heat of solution.

**K<sub>2</sub>CO<sub>3</sub> (aq.).** Berthelot<sup>4</sup> measured the heat of mixing CO<sub>2</sub> (aq.) with 2KOH (aq.); Muller<sup>1</sup> that of mixing K<sub>2</sub>CO<sub>3</sub> (aq.) with 2HCl (aq.). Their data yield, respectively, for K<sub>2</sub>CO<sub>3</sub>(1800),  $Q_f = 280.61$ , and for K<sub>2</sub>CO<sub>3</sub>(1950),  $Q_f = 280.66$ . Data on the heat of dilution were given by Berthelot,<sup>4</sup> Thomsen,<sup>15</sup> Rümelin,<sup>1</sup> and de Forcrand.<sup>52</sup> We have estimated the values from 400 to ∞ H<sub>2</sub>O.

**K<sub>2</sub>CO<sub>3</sub> (c).** The data on the heat of solution yield the following values for  $S_{400}$ : Berthelot,<sup>10</sup> 6.8 (?); Berthelot and Illosvay,<sup>1</sup> 6.66; Ostwald,<sup>1</sup> 6.64; Thomsen,<sup>15</sup> 6.59.

**K<sub>2</sub>CO<sub>3</sub> (liq.).** Sackur<sup>1</sup> reported the heat of fusion.

**K<sub>2</sub>CO<sub>3</sub> · nH<sub>2</sub>O (c).** Thomsen<sup>15</sup> measured the heats of solution of K<sub>2</sub>CO<sub>3</sub> ·  $\frac{1}{2}$  H<sub>2</sub>O (c) and K<sub>2</sub>CO<sub>3</sub> ·  $1\frac{1}{2}$  H<sub>2</sub>O (c). Berthelot's<sup>10</sup> measurement of the heat of solution of the latter lacks adequate information as to concentration and temperature.

**KHCO<sub>3</sub> (aq.).** Berthelot<sup>4</sup> measured the heat of mixing CO<sub>2</sub> (aq.) with KOH (aq.); Muller<sup>1</sup> that of mixing KHCO<sub>3</sub> (aq.) with HCl (aq.). Their data yield, respectively, for KHCO<sub>3</sub>(1900),  $Q_f = 225.01$ , and for KHCO<sub>3</sub>(1000),  $Q_f = 224.96$ .

**KHCO<sub>3</sub> (c).** The data of Berthelot<sup>10</sup> and de Forcrand<sup>53</sup> yield for the heat of solution,  $-5.2_{400}$  and  $-5.2_{220}$ , respectively. The dissociation pressure data of Caven and Sand<sup>2</sup> yield  $Q_f = 228.9$ .

**5(K<sub>2</sub>CO<sub>3</sub> ·  $1\frac{1}{2}$  H<sub>2</sub>O) · 4KHCO<sub>3</sub> (c).** de Forcrand<sup>54</sup> measured the heat of solution.

**K<sub>2</sub>C<sub>2</sub>O<sub>4</sub> (aq.).** Berthelot<sup>10</sup> measured the heat of neutralization of H<sub>2</sub>C<sub>2</sub>O<sub>4</sub>(220) with 2KOH(110). Berthelot and Guntz<sup>1</sup> measured the heat of mixing KF(110) with  $\frac{1}{2}$  H<sub>2</sub>C<sub>2</sub>O<sub>4</sub>(220), and of HF(110) with  $\frac{1}{2}$  K<sub>2</sub>C<sub>2</sub>O<sub>4</sub>(220). Their data yield, respectively, for K<sub>2</sub>C<sub>2</sub>O<sub>4</sub>(440),  $Q_f = 316.16$ , and for K<sub>2</sub>C<sub>2</sub>O<sub>4</sub>(220),  $Q_f = 316.5$ .

**K<sub>2</sub>C<sub>2</sub>O<sub>4</sub> (c).** Berthelot<sup>10</sup> measured the heat of solution of potassium oxalate.

**K<sub>2</sub>C<sub>2</sub>O<sub>4</sub> · H<sub>2</sub>O (c).** For the heat of solution, the data of Berthelot<sup>10</sup> and Thomsen<sup>15</sup> yield, respectively,  $-7.57_{400}$  and  $-7.52_{800}$ .

**KCHO<sub>2</sub> (aq.).** Berthelot<sup>8</sup> measured the heat of neutralization of aqueous formic acid with KOH (aq.), and performed "double decom-

position" experiments involving  $K^+$ ,  $CHO_2^-$ ,  $H^+$ ,  $Cl^-$ . His data yield, respectively, for  $KCHO_2$ (480),  $Q_f=159.67$ , and for  $KCHO_2$ (330),  $Q_f=160.18$ .

**$KCHO_2$  (c).** Berthelot<sup>10</sup> measured the heat of solution of potassium formate.

**$KC_2H_3O_2$  (aq.).** Berthelot<sup>10</sup> and Berthelot and Guntz<sup>1</sup> performed "double decomposition" experiments involving  $K^+$ ,  $C_2H_3O_2^-$ ,  $H^+$ ,  $Cl^-$  and  $K^+$ ,  $C_2H_3O_2^-$ ,  $H^+$ ,  $F^-$ , respectively. Their data yield, for  $KC_2H_3O_2$ (110),  $Q_f=178.43$  and  $177.69$ . Thomsen<sup>15</sup> measured the heat of dilution of aqueous potassium acetate from 5 to 200  $H_2O$ . We have estimated the values to infinite dilution.

**$KC_2H_3O_2$  (c).** The data of Thomsen<sup>15</sup> and Berthelot<sup>10, 131</sup> yield, for the heat of solution of potassium acetate,  $3.34_{200}$  and  $3.37_{200}$ , respectively.

**$KCH_3O(CH_3OH)$ .** de Forcrand<sup>16</sup> measured the heat of solution of K (c) in methyl alcohol.

**$KC_2H_5O(C_2H_5OH)$ .** de Forcrand<sup>16</sup> and van Deventer and Reicher<sup>2</sup> measured the heat of solution of K (c) in ethyl alcohol. Their data, respectively, yield for  $KC_2H_5O$  (60  $C_2H_5OH$ ),  $Q_f=116.49$ , and for  $KC_2H_5O$  (427  $C_2H_5OH$ ),  $Q_f=117.64$ .

**$KC_2H_3O_3$  (aq.).** de Forcrand<sup>3</sup> measured the heat of neutralization of aqueous glycollic acid.

**$KC_2H_3O_3 \cdot n H_2O$  (c).** de Forcrand<sup>3</sup> measured the heats of solution of the anhydrous salt and the hemihydrate of potassium glycollate.

**KCN (aq.).** Berthelot<sup>27</sup> measured the heat of neutralization of HCN(110) with KOH(110). His data yield  $N=2.93_{220}$ . Thomsen<sup>15</sup> measured the heat of dilution from  $62\frac{1}{2}$  to 150  $H_2O$ .

**KCN (c).** The data of Berthelot<sup>10</sup> and Thomsen<sup>15</sup> yield, respectively, for the heat of solution,  $-2.93_{200}$  and  $-3.08_{1740}$ .

**KCNO (aq.).** The data of Berthelot<sup>109</sup> yield  $N=12.2$ .

**KCNO (c).** The heat of solution was measured by Berthelot.<sup>10</sup>

**KCNS (aq.).** The data of Joannis<sup>1</sup> yield  $N=14.0$ . Partington and Soper<sup>1</sup> measured the heat of dilution at  $25^\circ$  in the range 2.3 to 200  $H_2O$ . We have converted their data to  $18^\circ$  and extrapolated to infinite dilution.

**KCNS (c).** The heat of solution data yield the following values for  $S_{200}$ : Joannis,<sup>1</sup>  $-5.98$ ; Wrzesnewsky,<sup>1</sup>  $-6.22$ ; Partington and Soper,<sup>1</sup>  $-6.00$ .

**$KCNS \cdot nSO_2$  (c).** Ephraim and Kornblum<sup>1</sup> found for  $n=\frac{1}{2}$ ,  $D=-11.3$ , and for  $n=1$ ,  $D=-9.9$ .

**$K_2SiF_6$  (c).** Truchot<sup>2</sup> measured the heat of reaction of  $H_2SiF_6$ (330) with  $2KOH$ (110), and of  $SiF_4$  (g) with  $2KF$  (aq.); Hantke,<sup>1</sup> that of  $H_2SiF_6$ (220) with  $2KOH$ (110). Their data yield, respectively, for  $K_2SiF_6$  (c),  $Q_f=683.9$ ,  $684.5$ , and  $682.1$ .

**$K_2SnCl_6$  (aq.).** Thomsen<sup>15</sup> measured the heat of mixing  $2KCl$ (150) with  $SnCl_4$ (300).

**$K_2SnCl_6$  (c).** The heat of solution was measured by Thomsen.<sup>15</sup>

**$K_2SnCl_6 \cdot H_2O$  (c).** Thomsen<sup>15</sup> measured the heat of solution.

$\text{KCl} \cdot n\text{PbCl}_2 \cdot m\text{H}_2\text{O}$  (c). Brönsted,<sup>10</sup> from electromotive force measurements, determined the heat of reaction of  $\text{KCl}$ (c) with  $\text{PbCl}_2$ (c) and  $\text{H}_2\text{O}$  (liq.) to form  $\text{KCl} \cdot 2\text{PbCl}_2$  (c) and  $\text{KCl} \cdot \text{PbCl}_2 \cdot \frac{1}{3}\text{H}_2\text{O}$  (c), respectively.

$2\text{KI} \cdot \text{PbI}_2 \cdot n\text{H}_2\text{O}$  (c). Berthelot<sup>89</sup> measured the heats of solution of the anhydrous salt and the dihydrate.

$4\text{KI} \cdot 3\text{PbI}_2 \cdot n\text{H}_2\text{O}$  (c). Berthelot<sup>89</sup> measured the heats of solution of  $4\text{KI} \cdot 3\text{PbI}_2$  (c, fresh melt) and the hexahydrate.

$\text{K}_2\text{SO}_4 \cdot \text{PbSO}_4$  (c). The data of Barre,<sup>1</sup> who measured the heats of solution of  $\text{K}_2\text{SO}_4 \cdot \text{PbSO}_4$  (c) and of  $\text{K}_2\text{SO}_4$  (c) +  $\text{PbSO}_4$  (c), and Brönsted,<sup>9</sup> who measured the heats of solution of the double salt and of  $\text{K}_2\text{SO}_4$  (c) in  $\text{Pb}(\text{NO}_3)_2$  (aq.), yield, for  $\text{K}_2\text{SO}_4$  (c) +  $\text{PbSO}_4$  (c) =  $\text{K}_2\text{SO}_4 \cdot \text{PbSO}_4$  (c),  $Q = -0.02$  and  $5.30$ , respectively. From electromotive force measurements, Brönsted<sup>9</sup> found  $Q = 5.09$ .

$\text{K}_2\text{Zn}(\text{SO}_4)_2 \cdot n\text{H}_2\text{O}$  (c). Thomsen<sup>15</sup> measured the heats of solution of the anhydrous salt, the dihydrate, and the hexahydrate. The first data on the anhydrous salt and the hexahydrate were obtained by Graham.<sup>2</sup> The vapor pressure data of Caven and Ferguson<sup>2</sup> yield, for the hexahydrate,  $Q_f = 1010.9$ .

$2\text{KCN} \cdot \text{Zn}(\text{CN})_2$  (c). Berthelot<sup>114</sup> measured the heat of solution.

$\text{KHg}_n$  (liq.). The data of Berthelot,<sup>56</sup> Lewis and Keyes,<sup>1</sup> and Smith and Ball,<sup>1</sup> yield, respectively:  $n = 57.5$ ,  $Q_f = 25.6$ ;  $n = 86.5$ ,  $Q_f = 26.0$ ;  $n = 145$ ,  $Q_f = 25.9$ .

$\text{KHg}_n$  (c). Berthelot<sup>55</sup> measured the heat of solution of  $\text{KHg}_{2.59}$  (c) in  $\text{H}_2\text{O}$  and in  $\text{HCl}(200)$ , and (Berthelot<sup>56</sup>) of four solid amalgams, with  $n$  ranging from  $1.45$  to  $12.0$ , in  $\text{HCl}(300)$ .

$n\text{KCl} \cdot \text{HgCl}_2$  (aq.). Berthelot<sup>83</sup> measured the heat of mixing  $\text{HgCl}_2$  (440) with  $\frac{1}{2}$ ,  $\frac{3}{4}$ ,  $1$ ,  $2$ , and  $4$  moles of  $\text{KCl}(110)$ , respectively; Thomsen<sup>15</sup> that of  $\text{HgCl}_2$  (c) with  $2\text{KCl}(150)$ .

$n\text{KCl} \cdot \text{HgCl}_2 \cdot m\text{H}_2\text{O}$  (c). Berthelot<sup>83</sup> measured the heats of solution of  $\text{KCl} \cdot \text{HgCl}_2$  (c) and its monohydrate,  $2\text{KCl} \cdot \text{HgCl}_2$  (c),  $4\text{KCl} \cdot 3\text{HgCl}_2$  (c) and its trihydrate, and  $2\text{KCl} \cdot \text{HgCl}_2 \cdot \text{H}_2\text{O}$  (c). Thomsen<sup>15</sup> also measured the heat of solution of the last named compound and, for it, their data yield the values: Thomsen,  $-16.43_{600}$ ; Berthelot,  $-16.53_{970}$ .

$n\text{KBr} \cdot \text{HgBr}_2$  (aq.). Berthelot<sup>83</sup> measured the heats of mixing  $\text{KBr}(110)$  with  $\text{HgBr}_2(4400)$ ; Varet<sup>6</sup> of  $\text{KBr}(220)$  with  $\text{HgBr}_2(4400)$ . Thomsen<sup>15</sup> measured the heat of solution of  $\text{HgBr}_2$  (c) in  $2\text{KBr}(150)$ .

$n\text{KBr} \cdot \text{HgBr}_2 \cdot m\text{H}_2\text{O}$  (c). Berthelot<sup>83</sup> measured the heats of solution of  $\text{KBr} \cdot \text{HgBr}_2$  (c) and of its monohydrate, in  $5\text{KBr}(110)$ . Thomsen<sup>15</sup> measured the heat of solution of  $2\text{KBr} \cdot \text{HgBr}_2$  (c).

$n\text{KI} \cdot \text{HgI}_2$  (aq.). Berthelot<sup>85</sup> measured the heat of solution of  $\text{HgI}_2$  (c, red) in  $2$ ,  $3$ ,  $4$ , and  $6$  moles of  $\text{KI}(110)$ ; Thomsen<sup>15</sup> that in  $2\text{KI}(200)$  +  $500\text{H}_2\text{O}$ .

$n\text{KI} \cdot \text{HgI}_2 \cdot m\text{H}_2\text{O}$  (c). Berthelot<sup>83</sup> measured the heats of solution of  $\text{KI} \cdot \text{HgI}_2$  (c) and of its monohydrate, in  $13\text{KI}(110)$ ; Thomsen<sup>15</sup> that of  $2\text{KI} \cdot \text{HgI}_2$  (c) in water.

$n\text{KCN} \cdot \text{Hg}(\text{CN})_2$  (aq.). Berthelot<sup>85</sup> measured the heats of mixing  $\text{Hg}(\text{CN})_2$ (440) with  $\frac{1}{2}$ , 1, 2, 4, 8, and 16 moles of  $\text{KCN}$ (110); Varet<sup>2</sup> that with 1 and 2 moles of  $\text{KCN}$ (110).

$2\text{KCN} \cdot \text{Hg}(\text{CN})_2$  (c). Berthelot<sup>10</sup> measured the heat of solution.

$n\text{KCl} \cdot \text{Hg}(\text{CN})_2$  (aq.). Berthelot<sup>86</sup> measured the heats of mixing  $\text{Hg}(\text{CN})_2$ (440) with  $\frac{1}{2}$ , 1, 2, 4, and 8 moles of  $\text{KCl}$ (110); Varet<sup>2</sup> that with 2 moles of  $\text{KCl}$ (110).

$\text{KCl} \cdot \text{Hg}(\text{CN})_2 \cdot n\text{H}_2\text{O}$  (c). Berthelot<sup>85</sup> measured the heat of solution of the anhydrous salt and of its monohydrate.

$n\text{KBr} \cdot \text{Hg}(\text{CN})_2$  (aq.). Berthelot<sup>83</sup> measured the heats of mixing  $\text{Hg}(\text{CN})_2$ (440) with  $\frac{1}{2}$ , 1, 2, 4, and 8 moles of  $\text{KBr}$ (110); Varet<sup>2</sup> those with 1 and 2 moles of  $\text{KBr}$ (110).

$\text{KBr} \cdot \text{Hg}(\text{CN})_2 \cdot n\text{H}_2\text{O}$  (c). Berthelot<sup>83</sup> measured the heats of solution of the anhydrous salt and the hydrate with  $1\frac{1}{2}$  moles of  $\text{H}_2\text{O}$ .

$n\text{KI} \cdot \text{Hg}(\text{CN})_2$  (aq.). Berthelot<sup>83</sup> measured the heats of mixing  $\text{Hg}(\text{CN})_2$ (440) with  $\frac{1}{2}$ , 1, 2, 4, and 8 moles of  $\text{KI}$ (110); Varet<sup>2</sup> that with 2 moles of  $\text{KI}$ (110).

$\text{KI} \cdot \text{Hg}(\text{CN})_2 \cdot n\text{H}_2\text{O}$  (c). Berthelot<sup>83</sup> measured the heats of solution of the anhydrous salt and the hydrate with  $\frac{1}{4}\text{H}_2\text{O}$ .

$\text{KCl} \cdot \text{CuCl}_2$  (c). Vriens<sup>1</sup> measured the heat of solution of this double salt; Agostini,<sup>1</sup> that of the double salt, of  $\text{CuCl}_2$  (c), and of  $\text{KCl}$  (c). Their data yield, respectively,  $Q_f=159.8$  and  $162.4$ .

$2\text{KCl} \cdot \text{CuCl}_2$  (c). The electromotive force data of Brönsted<sup>10</sup> yield  $Q_f=244.78$ .

$2\text{KCl} \cdot \text{CuCl}_2$  (c). Bouzat and Chauvenet<sup>2</sup> measured the heat of solution of  $2\text{KCl} \cdot \text{CuCl}_2$  (c); Agostini<sup>1</sup> that of  $2\text{KCl} \cdot \text{CuCl}_2$  (c), of  $\text{KCl}$  (c), and of  $\text{CuCl}_2$  (c). Their data yield, respectively;  $Q_f=265.7$  and  $266.2$ .

$2\text{KCl} \cdot \text{CuCl}_2 \cdot 2\text{H}_2\text{O}$  (c). Bouzat and Chauvenet<sup>2</sup> measured the heat of solution, as did Vriens<sup>1</sup> and Favre and Valson.<sup>1</sup> The data of Bouzat and Chauvenet, and Vriens, yield, respectively,  $Q_f=407.5$  and  $407.0$ .

$\text{K}_2\text{Cu}(\text{SO}_4)_2$  (c,  $\alpha$ ) (prepared below  $130^\circ$ ). The data of Thomsen<sup>15</sup> and Pickering<sup>4</sup> yield, respectively, for the heat of solution:  $9.48_{600}$  and  $9.67_{800}$ .

$\text{K}_2\text{Cu}(\text{SO}_4)_2$  (c,  $\beta$ ) (prepared between  $180$  and  $200^\circ$ ). The data of Pickering<sup>4</sup> yield  $S=6.23_{800}$ .

$\text{K}_2\text{Cu}(\text{SO}_4)_2$  (c, fused). The data of Pickering<sup>4</sup> yield  $S=8.37_{800}$ . Graham<sup>2</sup> also measured the heat of solution.

$\text{K}_2\text{Cu}(\text{SO}_4)_2 \cdot 2\text{H}_2\text{O}$  (c). The data of Thomsen<sup>15</sup> yield  $S=-1.17_{600}$ .

$\text{K}_2\text{Cu}(\text{SO}_4)_2 \cdot 6\text{H}_2\text{O}$  (c). Data on the heat of solution were reported by Graham<sup>2</sup> and Favre.<sup>8</sup> The data of Thomsen<sup>15</sup> and Pickering<sup>5</sup> yield  $S=-13.50_{600}$  and  $-13.77_{800}$ , respectively. The dissociation pressure data of Caven and Ferguson<sup>1</sup> yield  $Q_f=962.7$ .

$\text{K}_2\text{Cu}(\text{CO}_3)_2$  (c). Pickering<sup>11</sup> measured the heat of solution of three crystalline forms of this double salt in  $\text{HCl}$ (35).

$n\text{KX} \cdot n'\text{AgX} \cdot m\text{H}_2\text{O}$  (c). Berthelot<sup>86</sup> measured the heats of solution of  $\text{KCl} \cdot \text{AgCl}$  (c),  $\text{KBr} \cdot \text{AgBr}$  (c),  $3 \text{KBr} \cdot \text{AgBr} \cdot \frac{1}{2} \text{H}_2\text{O}$  (c),  $\text{KI} \cdot \text{AgI} \cdot \frac{1}{4} \text{H}_2\text{O}$  (c),  $2 \text{KI} \cdot \text{AgI} \cdot \frac{1}{2} \text{H}_2\text{O}$  (c),  $3 \text{KI} \cdot \text{AgI}$  (c),  $3 \text{KI} \cdot \text{AgI} \cdot \frac{1}{2} \text{H}_2\text{O}$  (c), and  $3 \text{KI} \cdot 2 \text{AgI} \cdot \text{H}_2\text{O}$  (c).

$\text{KAg}(\text{CN})_2$  (aq.). Varet<sup>5</sup> measured the heat of solution of  $\text{AgCN}$  (c) in  $\text{KCN}$  (550).

$\text{KAg}(\text{CN})_2$  (c). Berthelot<sup>10</sup> measured the heat of solution of  $\text{KAg}(\text{CN})_2$  (c), and the heat of mixing  $\text{AgNO}_3$  (440) with  $2 \text{KCN}$  (110).

$\text{K}_2\text{Ag}(\text{CN})_3$  (aq.). Varet<sup>5</sup> measured the heats of solution of  $\text{AgCN}$  (c) in  $2 \text{KCN}$  (110),  $2 \text{KCN}$  (165), and  $2 \text{KCN}$  (660), respectively.

$\text{KAu}(\text{CN})_2$  (aq.). Biltz and Wien<sup>1</sup> measured the heat of solution of  $\text{AuCl}$  (c) in excess  $\text{KCN}$  (aq.).

$\text{K}_2\text{Ni}(\text{CN})_4$  (aq.). Varet<sup>5</sup> measured the heat of solution of  $\text{Ni}(\text{CN})_2$  (c) in  $2 \text{KCN}$  (aq.).

$\text{K}_2\text{CO}_3 \cdot \text{CoCO}_3 \cdot n\text{H}_2\text{O}$  (c). de Carli<sup>1</sup> measured the heats of solution of the anhydrous salt and the tetrahydrate in  $\text{HCl}$  (314).

$\text{KFe}(\text{SO}_4)_2$  (aq.). Thomsen<sup>15</sup> measured the heat of mixing  $\text{KFe}(\text{SO}_4)_2$  (600) with  $3 \text{KOH}$  (400).

$\text{K}_2\text{Fe}(\text{SO}_4)_2$  (aq.). Berthelot<sup>100</sup> measured the heat of mixing  $\text{FeSO}_4$  (220) with  $\text{K}_2\text{SO}_4$  (220).

$\text{K}_3\text{Fe}(\text{SO}_4)_3$  (aq.). Berthelot<sup>100</sup> measured the heat of mixing  $\text{Fe}_2(\text{SO}_4)_3$  (660) with  $3\text{K}_2\text{SO}_4$  (220).

$\text{K}_2\text{Fe}(\text{SO}_4)_2 \cdot 6 \text{H}_2\text{O}$  (c). The data of Graham<sup>1</sup> yield  $S = 10.3_{200}$ .

$\text{K}_2\text{Fe}(\text{SO}_4)_2 \cdot 4 \text{H}_2\text{O}$  (c). Caven and Ferguson<sup>2</sup> measured the dissociation pressure of the hexahydrate at various temperatures. Their data yield  $D = -10.4$ .

$\text{K}_n\text{H}_{3-n}\text{Fe}(\text{CN})_6$  (aq.). Joannis<sup>1</sup> measured the heat of reaction of  $\text{K}_4\text{Fe}(\text{CN})_6$  (aq.) with  $\frac{1}{2} \text{Br}_2$  (liq.),  $\text{K}_4\text{Fe}(\text{CN})_6$  (aq.) with  $\frac{1}{2} \text{Cl}_2$  (g),  $\text{H}_3\text{Fe}(\text{CN})_6$  (aq.) with  $\text{KOH}$  (aq.), and  $\text{H}_3\text{Fe}(\text{CN})_6$  (aq.) with  $2\text{KOH}$  (aq.). These data yield, respectively, the values for the heats of formation of  $\text{K}_3\text{Fe}(\text{CN})_6$  (aq.),  $\text{KH}_2\text{Fe}(\text{CN})_6$  (aq.), and  $\text{K}_2\text{HFe}(\text{CN})_6$  (aq.).

$\text{K}_3\text{Fe}(\text{CN})_6$  (c). Joannis<sup>1</sup> measured the heat of solution.

$\text{K}_4\text{Fe}(\text{CN})_6$  (aq.). The data of Joannis,<sup>1</sup> Muller,<sup>2</sup> and Chretien and Guinechant<sup>1</sup> yield, respectively, for  $N$ : 55.1;  $56.08_{1390}$ ;  $57.5_{5200}$ . Muller's<sup>2</sup> data yield, for  $\text{K}_4\text{Fe}(\text{CN})_6$  (aq.),  $Q_f = 119.50$ .

$\text{K}_n\text{H}_{4-n}\text{Fe}(\text{CN})_6$  (aq.). Muller<sup>2</sup> measured the heat of mixing  $\text{H}_4\text{Fe}(\text{CN})_6$  (aq.) with 1, 2, and 3 moles of  $\text{KOH}$  (aq.).

$\text{K}_4\text{Fe}(\text{CN})_6$  (c). Berthelot<sup>10</sup> found  $S = -11.96_{510}^{12}$ ; Schottky,<sup>1</sup>  $S = -12.39_{1000}^{17}$ .

$\text{K}_4\text{Fe}(\text{CN})_6 \cdot 3 \text{H}_2\text{O}$  (c). Berthelot<sup>10</sup> found  $S = -16.92_{590}^{11}$ ; Schottky,<sup>1</sup>  $S = -15.69_{1000}^{17}$ .

$\text{K}_3\text{FeCO}(\text{CN})_5$  (aq.). Muller<sup>9</sup> found  $N = 42.0$ .

$\text{K}_3\text{FeCO}(\text{CN})_5 \cdot n\text{H}_2\text{O}$  (c). Muller<sup>9</sup> measured the heats of solution of the anhydrous salt and the hydrate with  $3\frac{1}{2} \text{H}_2\text{O}$ .

$\text{KMnO}_4$  (aq.). Thomsen<sup>15</sup> measured the heats of reaction of  $2 \text{KMnO}_4$  (aq.) with  $10 \text{FeCl}_2$  (aq.), with  $5 \text{H}_2\text{O}_2$  (aq.), and with  $5 \text{SnCl}_2$  (aq.),

respectively, and his data yield, for  $\text{KMnO}_4$  (aq.), the average value  $Qf=182.5$ .

**$\text{KMnO}_4$  (c).** The data of Thomsen<sup>15</sup> yield  $-10.42_{500}$  and  $-10.10_{700}$  for the heat of solution.

**$\text{KReO}_4$  (aq.).** Roth and Becker<sup>4</sup> measured the heat of neutralization of  $\text{HReO}_4$  (aq.), and gave the value  $N_\infty^{20}=13.5\pm0.1$ . Converted to  $18^\circ$ , this value becomes  $13.61\pm0.1$ . From the ions we have calculated, for  $\text{KReO}_4$  ( $\infty$ ),  $Qf=284.5$ . We have estimated the heat of dilution of aqueous  $\text{KReO}_4$  from the data of Roth and Becker<sup>4</sup> on the heat of solution of the solid salt.

**$\text{KReO}_4$  (c).** The data of Roth and Becker<sup>4</sup> yield  $-13.88_{8600}$  for the heat of solution.

**$\text{K}_2\text{Mn}(\text{SO}_4)_2 \cdot n\text{H}_2\text{O}$  (c).** Thomsen<sup>15</sup> measured the heats of solution of the anhydrous salt, the dihydrate, and the tetrahydrate.

**$\text{K}_2\text{PdCl}_4$  (aq.).** Thomsen<sup>15</sup> measured the heat of reaction of  $\text{K}_2\text{PdCl}_4$  (1400) with Co (c) and 2 CuCl (c), respectively; Joannis,<sup>4</sup> that of  $\text{K}_2\text{PdCl}_4$  (aq.) with 2 CuCl (c). Their data yield, respectively,  $Qf=247.8$ ,  $248.9$ , and  $251.4$ .

**$\text{K}_2\text{PdCl}_4$  (c).** Thomsen<sup>15</sup> found  $S=-13.64_{800}^{19.5}$ ; Joannis,<sup>4</sup>  $S=-4.6$  (?).

**$\text{K}_2\text{PdCl}_6$  (c).** Thomsen<sup>15</sup> measured the heat of reaction of  $\text{K}_2\text{PdCl}_6$  (c) with 4 KI (400), and with 4 CuCl (c) in water. His data yield, respectively,  $Qf=291.26$  and  $292.95$ .

**$\text{K}_2\text{PdCl}_6$  (aq.).** Thomsen<sup>15</sup> estimated the heat of solution.

**$\text{K}_2\text{PdBr}_4$  (aq.).** Joannis<sup>4</sup> measured the heat of reaction of Pd (c) with  $\text{Br}_2$  (liq.) and 2 KBr (aq.).

**$\text{K}_2\text{PdBr}_4$  (c).** Joannis<sup>4</sup> measured the heat of solution.

**$\text{K}_2\text{PtCl}_4$  (c).** Thomsen<sup>15</sup> measured the heat of reaction of  $\text{K}_2\text{PtCl}_4$  (c) with Co (c) in water.

**$\text{K}_2\text{PtCl}_4$  (aq.).** Thomsen<sup>15</sup> measured the heat of solution of  $\text{K}_2\text{PtCl}_4$  (c).

**$\text{K}_2\text{PtCl}_6$  (aq.).** Thomsen<sup>15</sup> measured the heat of reaction of  $\text{Na}_2\text{PtCl}_6$  (c) with 2 KCl (100); Gire<sup>2</sup> that of  $\text{K}_2\text{PtCl}_6$  (aq.) with 2 Co (c). Their data yield, respectively,  $Qf=286.2$  and  $289.7$ .

**$\text{K}_2\text{PtCl}_6$  (c).** The data of Thomsen<sup>15</sup> yield for the reaction,  $\text{Na}_2\text{PtCl}_6$  (aq.) + 2 KCl (aq.) =  $\text{K}_2\text{PtCl}_6$  (c) + 2 NaCl (aq.),  $Q=13.42$ . Hence,  $S=-13.42$ . Gire<sup>2</sup> found  $S=-12.15_{6600}^{12.5}$ . Gire's<sup>1</sup> data on the dissociation pressure of  $\text{K}_2\text{PtCl}_6$  (c) yield  $Qf=291$ .

**$\text{K}_2\text{PtBr}_4$  (aq.).** Thomsen<sup>15</sup> measured the heat of reaction of  $\text{K}_2\text{PtBr}_4$  (1500) with  $\text{Br}_2$  (liq.), and of  $\text{K}_2\text{PtBr}_4$  (750) with Co (c). His data yield, respectively,  $Qf=210.77$  and  $210.72$ .

**$\text{K}_2\text{PtBr}_4$  (c).** Thomsen<sup>15</sup> measured the heat of solution.

**$\text{K}_2\text{PtBr}_6$  (c).** Thomsen<sup>15</sup> measured the heat of reaction of  $\text{K}_2\text{PtBr}_6$  (c) with 2 Co (c) in water.

**$\text{K}_2\text{PtBr}_6$  (aq.).** Thomsen<sup>15</sup> measured the heat of solution of  $\text{K}_2\text{PtBr}_6$  (c).

**K<sub>2</sub>IrCl<sub>6</sub> (c).** The data of Gire<sup>1</sup> on the dissociation pressure-temperature relationship yield  $Q_f = 286$ .

**K<sub>2</sub>IrCl<sub>6</sub> (aq.).** Gire<sup>2</sup> measured the heat of solution of K<sub>2</sub>IrCl<sub>6</sub> (c).

**K<sub>3</sub>IrCl<sub>6</sub> (aq.).** Gire<sup>2</sup> measured the heat of the reaction, K<sub>2</sub>IrCl<sub>6</sub> (aq.) +  $\frac{1}{2}$  Co (c) + KCl (aq.) = (K<sub>3</sub>IrCl<sub>6</sub> +  $\frac{1}{2}$  CoCl<sub>2</sub>) (aq.).

**K<sub>3</sub>IrCl<sub>6</sub> (c).** Gire<sup>2</sup> measured the heat of solution. His data (Gire<sup>1</sup>) on the dissociation pressure yield  $Q_f = 373$ .

**K<sub>2</sub>CrO<sub>4</sub> (aq.).** The data of Morges<sup>1</sup> yield  $N = 22.78_{440}$ ; those of Sabatier<sup>5</sup> yield  $N = 25.4_{440}$ . The heat of dilution was measured by Roth, Schwartz, and Buchner.<sup>1</sup>

**K<sub>2</sub>CrO<sub>4</sub> (c, II).** Graham<sup>2</sup> and Morges<sup>1</sup> measured the heat of solution, the data of the latter yielding  $S = -5.25_{543}$ .

**K<sub>2</sub>CrO<sub>4</sub> (c, I).** Hare<sup>1</sup> measured the heat of transition.

**K<sub>2</sub>Cr<sub>2</sub>O<sub>7</sub> (aq.).** Morges<sup>1</sup> measured the heat of mixing CrO<sub>3</sub>(220) with KOH(110); Berthelot,<sup>95</sup> K<sub>2</sub>Cr<sub>2</sub>O<sub>7</sub>(660) with 2 KOH(110), and 2 K<sub>2</sub>CrO<sub>4</sub>(220) with 2 HCl(110); Sabatier,<sup>5</sup> CrO<sub>3</sub>(220) with KOH(110), and K<sub>2</sub>Cr<sub>2</sub>O<sub>7</sub>(220) with 2 KOH(110). Their data yield, respectively, for K<sub>2</sub>Cr<sub>2</sub>O<sub>7</sub>(400),  $Q_f = 469.8, 471.6, 471.4, 471.8$ , and 471.8. The data of Stackelberg<sup>1</sup> give the heat of dilution.

**K<sub>2</sub>Cr<sub>2</sub>O<sub>7</sub> (c).** The data on the heat of solution yield the following values for  $S_{400}$ : Graham,<sup>2</sup> (?); Morges,<sup>1</sup>  $-16.61$ ; Berthelot,<sup>95</sup>  $-16.20$ ; Thomsen,<sup>15</sup>  $-16.70$ ; Stackelberg,<sup>1</sup>  $-16.68$ . We have selected the average of the last two values.

**KCl · CrO<sub>3</sub> (c).** Morges<sup>1</sup> measured the heat of solution.

**K<sub>2</sub>Cr<sub>2</sub>O<sub>7</sub> · CrO<sub>3</sub> (c).** Graham<sup>2</sup> measured the heat of solution.

**KCr(SO<sub>4</sub>)<sub>2</sub> (aq.).** Thomsen<sup>15</sup> measured the heat of mixing KCr(SO<sub>4</sub>)<sub>2</sub>(600) with 3 KOH(400).

**KCr(SO<sub>4</sub>)<sub>2</sub> · nH<sub>2</sub>O (c).** Thomsen<sup>15</sup> measured the heat of solution of the dodecahydrate. Kraus, Fricke, and Querengasser<sup>1</sup> measured the vapor pressures of the various hydrates over a range of temperature.

**KNH<sub>4</sub>CrO<sub>4</sub> (aq.).** Sabatier<sup>5</sup> measured the heat of mixing K<sub>2</sub>Cr<sub>2</sub>O<sub>7</sub>(440) with 2 NH<sub>3</sub>(110).

**KNH<sub>4</sub>CrO<sub>4</sub> (c).** Sabatier<sup>5</sup> measured the heat of solution.

**K<sub>2</sub>MoO<sub>4</sub> (aq.).** Pechard<sup>1</sup> found, for H<sub>2</sub>MoO<sub>4</sub> (c) + 2 KOH(440),  $N = 24.1$ .

**2 KCl · UOCl<sub>2</sub> · 2 H<sub>2</sub>O (c).** Aloy<sup>1</sup> measured the heat of solution.

**KVO<sub>5</sub> (aq.).** This value is obtained from those for the aqueous ions.

**KVO<sub>3</sub> (aq.), KVO<sub>4</sub> (aq.).** Pissarjewsky<sup>4</sup> measured the heat of mixing KVO<sub>3</sub> (aq.) with 2 H<sub>2</sub>O<sub>2</sub> (aq.) and H<sub>2</sub>O<sub>2</sub> (aq.), respectively.

**KVO<sub>3</sub> (c), KVO<sub>4</sub> (c).** Pissarjewsky<sup>4</sup> measured the heats of solution.

**nKCl · ThCl<sub>4</sub> · mH<sub>2</sub>O (c).** Chauvenet<sup>2</sup> measured the heats of solution of 2 KCl · ThCl<sub>4</sub> (c) and KCl · ThCl<sub>4</sub> · 9 H<sub>2</sub>O (c).

**3 KF · AlF<sub>3</sub> (aq.).** The data of Baud<sup>1</sup> yield for the heat of mixing 3 KF (aq.) with AlF<sub>3</sub> (aq.),  $Q = -1.51$ .

**3 KF · AlF<sub>3</sub> · nH<sub>2</sub>O (c).** Baud<sup>1</sup> measured the heats of solution of the anhydrous salt and the hydrate with  $3\frac{1}{2}$  H<sub>2</sub>O.

$n\text{KCl} \cdot \text{AlCl}_3$  (c). Baud<sup>1</sup> measured the heats of solution of  $\text{KCl} \cdot \text{AlCl}_3$  (c),  $3\text{KCl} \cdot \text{AlCl}_3$  (c), and  $3\text{KCl} \cdot 2\text{AlCl}_3$  (c).

$\text{KCl} \cdot \text{AlCl}_3 \cdot 6\text{NH}_3$  (c). Baud<sup>1</sup> measured the heat of solution.

$\text{KAl}(\text{SO}_4)_2$  (aq.). Thomsen<sup>15</sup> measured the heat of mixing  $\text{KAl}(\text{SO}_4)_2$  (600) with  $3\text{KOH}$  (400).

$\text{KAl}(\text{SO}_4)_2 \cdot n\text{H}_2\text{O}$  (c). Favre and Silbermann<sup>3</sup> and Thomsen<sup>15</sup> measured the heat of solution of the dodecahydrate, the latter's data yielding  $S = -10.10_{800}$ . The heats of dehydration have been calculated from the vapor pressure data of Kraus, Fricke, and Querengasser.<sup>1</sup> See also Ephraïm and Wagner.<sup>1</sup>

$\text{K}_2\text{O} \cdot \text{Al}_2\text{O}_3 \cdot n\text{SiO}_2$  (solid). Mulert<sup>1</sup> measured the heats of solution, in 20% HF (aq.), of  $\text{K}_2\text{O} \cdot \text{Al}_2\text{O}_3 \cdot 4\text{SiO}_2$  (c, leucite), of  $\text{K}_2\text{O} \cdot \text{Al}_2\text{O}_3 \cdot 6\text{SiO}_2$  (c, adular), and of  $\text{K}_2\text{O} \cdot \text{Al}_2\text{O}_3 \cdot 6\text{SiO}_2$  (gls.); Tammann (as reported by Mulert<sup>1</sup>) those of  $\text{K}_2\text{O} \cdot \text{Al}_2\text{O}_3 \cdot 4\text{SiO}_2$  (c, leucite), of  $\text{K}_2\text{O} \cdot \text{Al}_2\text{O}_3 \cdot 4\text{SiO}_2$  (gls.), of  $\text{K}_2\text{O} \cdot \text{Al}_2\text{O}_3 \cdot 6\text{SiO}_2$  (c, microcline), and of  $\text{K}_2\text{O} \cdot \text{Al}_2\text{O}_3 \cdot 6\text{SiO}_2$  (gls.). For the first substance the respective data yield,  $Q_f = 1379.8$  and  $1374.7$ ; for the last substance,  $Q_f = 1754.9$  and  $1738.0$ .

$n\text{KCl} \cdot \text{MgCl}_2 \cdot m\text{H}_2\text{O}$  (c, fresh melt). Berthelot and Ilosvay<sup>1</sup> measured the heats of solution of the fresh melts of  $\text{KCl} \cdot \text{MgCl}_2$  (c),  $\text{KCl} \cdot \text{MgCl}_2 \cdot 6\text{H}_2\text{O}$  (c),  $2\text{KCl} \cdot \text{MgCl}_2$  (c), and  $4\text{KCl} \cdot \text{MgCl}_2$  (c).

$\text{K}_2\text{Mg}(\text{SO}_4)_2$  (c) (prepared below  $150^\circ$ ). Pickering<sup>4</sup> found  $S = 11.53_{800}$ ; Thomsen,<sup>15</sup>  $S = 10.62_{600}$ .

$\text{K}_2\text{Mg}(\text{SO}_4)_2$  (c) (fresh melt). The data of Berthelot and Ilosvay,<sup>1</sup> and Pickering<sup>4</sup> yield, respectively, for  $S_{800}$ , 6.92 and 7.30.

$\text{K}_2\text{Mg}(\text{SO}_4)_2 \cdot 2\text{H}_2\text{O}$  (c). Thomsen<sup>15</sup> measured the heat of solution.

$\text{K}_2\text{Mg}(\text{SO}_4)_2 \cdot 4\text{H}_2\text{O}$  (c). Caven and Ferguson<sup>2</sup> measured the dissociation pressure over a range of temperature, finding  $D = -10.4$ .

$\text{K}_2\text{Mg}(\text{SO}_4)_2 \cdot 5\text{H}_2\text{O}$  (c). Thomsen<sup>15</sup> measured the heat of solution.

$\text{K}_2\text{Mg}(\text{SO}_4)_2 \cdot 6\text{H}_2\text{O}$  (c). The data on the heat of solution yield for  $S_{800}$ : Graham,<sup>2</sup> (?); Thomsen,<sup>15</sup>  $-10.10$ ; Pickering,<sup>5</sup>  $-9.94$ .

$2\text{KCl} \cdot \text{CaCl}_2$  (c) (fresh melt). Berthelot and Ilosvay<sup>1</sup> measured the heat of solution.

$\text{K}_2\text{SO}_4 \cdot n\text{CaSO}_4 \cdot \text{H}_2\text{O}$  (c). Barre<sup>1</sup> measured the heats of solution of the following:  $\text{K}_2\text{SO}_4 \cdot \text{CaSO}_4 \cdot \text{H}_2\text{O}$  (c),  $\text{K}_2\text{SO}_4$  (c) +  $\text{CaSO}_4 \cdot 2\text{H}_2\text{O}$  (c),  $\text{K}_2\text{SO}_4 \cdot 5\text{CaSO}_4 \cdot \text{H}_2\text{O}$  (c), and  $\text{K}_2\text{SO}_4$  (c) +  $5(\text{CaSO}_4 \cdot 2\text{H}_2\text{O})$  (c).

$\text{KCaFeCO}(\text{CN})_5 \cdot 5\text{H}_2\text{O}$  (c). Lecocq<sup>1</sup> measured the heat of combustion in a bomb calorimeter, finding  $Q = 2152$ .

$\text{K}_2\text{SO}_4 \cdot \text{SrSO}_4$  (c). Barre<sup>1</sup> measured the heats of solution of  $\text{K}_2\text{SO}_4 \cdot \text{SrSO}_4$  (c) and of  $\text{K}_2\text{SO}_4$  (c) +  $\text{SrSO}_4$  (c).

$\text{KLiClI}$  (c) (fresh melt). Beketoff<sup>8</sup> measured the heats of solution of the fresh melt, of  $\text{LiCl}$  (c) +  $\text{KI}$  (c), and of  $\text{LiI}$  (c) +  $\text{KCl}$  (c).

$\text{NaCl} \cdot \text{KCl}$  (c) (fresh melt). Beketoff<sup>8</sup> measured the heats of solution of the fresh melt and of  $\text{NaCl}$  (c) +  $\text{KCl}$  (c).

$\text{KNaClI}$  (c) (fresh melt). Beketoff<sup>8</sup> measured the heats of solution of the fresh melt, of  $\text{NaCl}$  (c) +  $\text{KI}$  (c), and of  $\text{NaI}$  (c) +  $\text{KCl}$  (c).

**$\text{Na}_n\text{K}_m$  (liq.).** Joannis<sup>2</sup> measured the heats of solution of Na (c), K (c), NaK (liq.), NaK<sub>2</sub> (liq.), NaK<sub>3</sub> (liq.), and Na<sub>2</sub>K (liq.) in water.

**$\text{Na}_2\text{KPO}_4$  (aq.).** Berthelot and Louguinine<sup>3</sup> measured the heat of mixing Na<sub>2</sub>HPO<sub>4</sub>(220) with KOH(110).

**3 KCNS · NaCNS (c).** Wrzesnewsky<sup>1</sup> measured the heats of solution of KCNS (c), of NaCNS (c), and of 3 KCNS · NaCNS (c).

## RUBIDIUM

**Rb (c).** Standard state.

**Rb (liq.).** The data on the heat of fusion are: Rengade,<sup>4</sup>  $-0.524^{39}$ ; Bridgman,<sup>1</sup>  $-0.552^{39}$ .

**Rb (g).** Vapor pressure data were reported by Hackspill<sup>1</sup> and Killian.<sup>1</sup> See also van Laar.<sup>9</sup> The values for the energy states of gaseous monatomic rubidium are from Fowler,<sup>3</sup> Miller and Laporte,<sup>1</sup> and Bacher and Goudsmit.<sup>1</sup>

**RbOH (aq.).** The heat of solution of Rb (c) in water was measured by Beketoff<sup>3</sup> and Rengade.<sup>1</sup> Their data yield, respectively, for Rb (c) + H<sub>2</sub>O (liq.) = RbOH(200) +  $\frac{1}{2}$  H<sub>2</sub> (g),  $Q = 48.2$  and  $47.3$ . Taking the latest value, we have obtained, for LiOH(200),  $Q_f = 115.7$ . de Forcrand<sup>55</sup> measured the heat of dilution of RbOH (aq.) from 3.18 to 223 H<sub>2</sub>O. We have estimated the heat of dilution from 200 to  $\infty$  H<sub>2</sub>O to be zero.

**Rb<sup>+</sup> ( $\infty$ ).** The foregoing data give for Rb<sup>+</sup> ( $\infty$ ) + OH<sup>-</sup> ( $\infty$ ),  $Q_f = 115.7$ ; whence, for Rb<sup>+</sup> ( $\infty$ ),  $Q_f = 61.04$ .

**RbOH ·  $n$  H<sub>2</sub>O (c).** de Forcrand<sup>44</sup> measured the heats of solution of RbOH (c, II), RbOH · 0.613 H<sub>2</sub>O, and RbOH · H<sub>2</sub>O (c); and later (de Forcrand<sup>55</sup>) that of RbOH · 2 H<sub>2</sub>O (c).

**RbOH (c, I).** Hevesy<sup>1</sup> measured the heat of transition.

**Rb<sub>2</sub>O (c).** Rengade<sup>3</sup> measured the heat of solution in H<sub>2</sub>O. The similar data of Beketoff<sup>3</sup> are somewhat doubtful.

**Rb<sub>2</sub>O<sub>n</sub> (c).** de Forcrand<sup>66</sup> estimated the heats of formation of Rb<sub>2</sub>O<sub>2</sub> (c) and Rb<sub>2</sub>O<sub>4</sub> (c).

**RbH (c).** Kasarnowsky<sup>1</sup> quoted unpublished values of Monosohn, giving  $Q_f = 12$ .

**RbF (aq.).** From the ions, we have obtained, for RbF ( $\infty$ ),  $Q_f = 139.24$ . Lange and Monheim<sup>2</sup> measured the heat of dilution of RbF (aq.) in the very dilute region, and their data have been converted to 18° giving values from  $\infty$  to 100 H<sub>2</sub>O.

**RbF (c).** de Forcrand<sup>57</sup> measured the heat of solution.

**RbF (liq.).** We have estimated the heat of fusion.

**RbF (g).** The vapor pressure of RbF was measured by Von Wartenberg and Schulz<sup>1</sup> and Ruff, Schmidt, and Mugdan.<sup>1</sup>

**RbF ·  $n$  H<sub>2</sub>O (c).** de Forcrand<sup>59</sup> measured the heats of solution of RbF ·  $\frac{1}{3}$  H<sub>2</sub>O (c) and RbF ·  $1\frac{1}{2}$  H<sub>2</sub>O (c).

**RbHF<sub>2</sub> (aq.).** From the ions, we have obtained  $Q_f = 214.4$ .

**RbHF<sub>2</sub> (c).** de Forcrand<sup>60</sup> measured the heat of solution.

**RbCl (aq.).** From the ions, we have obtained, for  $\text{RbCl}(\infty)$ ,  $Q_f = 100.727$ . The heat of dilution has been estimated from  $\infty$  to  $100 \text{ H}_2\text{O}$ .

**RbCl (c).** The data on the heat of solution have been recomputed to give the following values for  $S_{200}$ : de Forcrand,<sup>46</sup>  $-4.36$ ; Zemezuzny and Rambach,<sup>1</sup>  $-4.43$ ; Haigh,<sup>1</sup>  $-4.34$ .

**RbCl (liq.).** We have estimated the heat of fusion.

**RbCl (g).** Vapor pressure data were reported by von Wartenberg and Schulz<sup>1</sup> and Ruff and Mugdan.<sup>1</sup> See also Sommermeyer.<sup>1</sup>

**RbBr (aq.).** From the ions, we have obtained, for  $\text{RbBr}(\infty)$ ,  $Q_f = 89.71$ . We have estimated the heat of dilution in the range  $\infty$  to  $100 \text{ H}_2\text{O}$ .

**RbBr (c).** de Forcrand<sup>57</sup> measured the heat of solution.

**RbBr (liq.).** Plato<sup>1, 2</sup> measured the heat of fusion.

**RbBr (g).** Vapor pressure data were reported by von Wartenberg and Schulz<sup>1</sup> and Ruff and Mugdan.<sup>1</sup>

**RbI (aq.).** From the ions, we have obtained for  $\text{RbI}(\infty)$ ,  $Q_f = 74.41$ . We have estimated the heat of dilution from  $\infty$  to  $100 \text{ H}_2\text{O}$ .

**RbI (c).** The data on the heat of solution yield the following values for  $S_{200}$ : de Forcrand,<sup>12, 57</sup>  $-6.55$ ; Mosnier,<sup>1</sup>  $-5.86$ .

**RbI (liq.).** We have estimated the heat of fusion.

**RbI (g).** Vapor pressure data were reported by von Wartenberg and Schulz<sup>1</sup> and Ruff and Mugdan.<sup>1</sup> Sommermeyer,<sup>1</sup> from absorption spectra of  $\text{RbI}(\text{g})$ , estimated  $D^* = -77.5$ .

**$\text{Rb}_2\text{S}$  (aq.).** Rengade and Costeaunu<sup>2</sup> measured the heat of neutralization of  $\text{RbOH}(\text{aq.})$  with  $\text{H}_2\text{S}(\text{aq.})$ . Their data yield, for  $\text{Rb}_2\text{S}(550)$ ,  $Q_f = 112.5$ . From the ions, we have obtained for  $\text{Rb}_2\text{S}(\infty)$ ,  $Q_f = 112.08$ .

**$\text{Rb}_2\text{S}$  (c).** Rengade and Costeaunu<sup>2</sup> measured the heat of solution.

**$\text{Rb}_2\text{SO}_4$  (aq.).** deForcrand<sup>46</sup> measured the heat of neutralization of  $\text{RbOH}(\text{aq.})$  with  $\text{H}_2\text{SO}_4(\text{aq.})$ . His data, combined with the heat of dilution, give, for  $\text{Rb}_2\text{SO}_4(\infty)$ ,  $Q_f = 337.64$ . From the ions, we have obtained  $337.88$ . Lange and Streeck<sup>1</sup> measured the heat of dilution at  $25^\circ$ . We have used their data to obtain values at  $18^\circ$  from  $\infty$  to  $200 \text{ H}_2\text{O}$ .

**$\text{Rb}_2\text{SO}_4$  (c).** deForcrand<sup>46</sup> measured the heat of solution.

**$\text{RbHSO}_4$  (aq.).** deForcrand<sup>46</sup> measured the heat of reaction of  $\text{RbOH}(110)$  with  $\text{H}_2\text{SO}_4(220)$ , and of  $\text{RbHSO}_4(330)$  with  $\text{RbOH}(110)$ . His data yield, for  $\text{RbHSO}_4(330)$ ,  $Q_f = 274.09$  and  $274.42$ , respectively.

**$\text{RbHSO}_4$  (c).** deForcrand<sup>46</sup> measured the heat of solution.

**$\text{RbI} \cdot 4\text{SO}_2$  (c).** The data of Ephraim and Kornblum<sup>1</sup> and deForcrand and Taboury,<sup>1</sup> on the temperature coefficient of the dissociation pressure, give, respectively,  $D = -10.1$  and  $-10.1$ .

**$\text{RbNO}_3$  (aq.).** From the ions, we have computed for  $\text{RbNO}_3(\infty)$ ,  $Q_f = 110.23$ . We have estimated the heat of dilution for the range  $\infty$  to  $100 \text{ H}_2\text{O}$ .

**$\text{RbNO}_3$  (c, II).** Haigh<sup>1</sup> measured the heat of solution.

**$\text{RbNO}_3$  (c, I).** Bridgman<sup>6a</sup> measured the heat of transition.

**RbX · nNH<sub>3</sub> (c).** Biltz and Hansen<sup>1</sup> measured the temperature coefficient of the dissociation pressures of RbBr · 3NH<sub>3</sub>(c) and RbI · 6NH<sub>3</sub>(c).

**Rb<sub>2</sub>CO<sub>3</sub> (aq.).** deForcrand<sup>49</sup> measured the heat of neutralization of RbOH (aq.) with CO<sub>2</sub> (aq.) His data, together with the heat of dilution, give for Rb<sub>2</sub>CO<sub>3</sub> (∞),  $Q_f = 282.76$ . From the ions, we have obtained 282.58. deForcrand<sup>52</sup> measured the heat of dilution of Rb<sub>2</sub>CO<sub>3</sub>(aq.), from 5.76 to 226 H<sub>2</sub>O. We have estimated the heats of dilution to 2000 and ∞ H<sub>2</sub>O.

**Rb<sub>2</sub>CO<sub>3</sub> (c).** deForcrand<sup>49, 52</sup> measured the heat of solution, and LeBeau<sup>1</sup> obtained data on the dissociation pressure at various temperatures.

**Rb<sub>2</sub>CO<sub>3</sub> · nH<sub>2</sub>O (c).** deForcrand<sup>52</sup> measured the heats of solution of Rb<sub>2</sub>CO<sub>3</sub> with 1, 1½, and 3½ moles of H<sub>2</sub>O.

**RbHCO<sub>3</sub> (aq.).** deForcrand<sup>53</sup> measured the heat of reaction of RbOH(110) with CO<sub>2</sub>(1800). His data yield for RbHCO<sub>3</sub>(1800),  $Q_f = 225.91$ .

**RbHCO<sub>3</sub> (c).** deForcrand<sup>53</sup> measured the heat of solution. His data yield  $Q_f = 230.44$ . The data of Caven and Sand<sup>2</sup> on the dissociation pressure at various temperatures yield  $Q_f = 232.8$ .

**3(Rb<sub>2</sub>CO<sub>3</sub> · 1½ H<sub>2</sub>O) · 2 RbHCO<sub>3</sub> (c).** de Forcrand<sup>54</sup> measured the heat of solution.

**RbCNS (aq.).** From the ions, we have obtained  $Q_f = 42.0$ .

**RbCNS (c).** The heat of solution is estimated to be  $-14$ .

**RbCNS · ½ SO<sub>2</sub> (c).** Ephraim and Kornblum<sup>1</sup> reported  $D = -10.6$ .

**2RbI · PbI<sub>2</sub> · nH<sub>2</sub>O (c).** Mosnier<sup>1</sup> measured the heats of solution of the anhydrous salt and the tetrahydrate.

**2RbCl · CuCl<sub>2</sub> · nH<sub>2</sub>O (c).** Bouzat and Chauvenet<sup>2</sup> measured the heats of solution of the anhydrous salt and the dihydrate.

**nRbCl · ThCl<sub>4</sub> · mH<sub>2</sub>O (c).** Chauvenet<sup>2</sup> measured the heat of solution of 2RbCl · ThCl<sub>4</sub> (c), 2RbCl · ThCl<sub>4</sub> · 9H<sub>2</sub>O (c), and 4RbCl · ThCl<sub>4</sub> (c).

**RbAl(SO<sub>4</sub>)<sub>2</sub> · nH<sub>2</sub>O (c).** For the dodecahydrate we have estimated the heat of solution to be  $-11$ . The heats of dissociation of the various hydrates have been calculated from the dissociation pressure data of Kraus, Fricke, and Querengasser<sup>1</sup> and Ephraim and Wagner.<sup>1</sup>

## CESIUM

**Cs (c).** Standard state.

**Cs (liq.).** The data on the heat of fusion are: Rengade,<sup>1</sup>  $-0.501^{28, 5}$ ; Bridgman,<sup>1</sup>  $-0.51^{28}$

**Cs (g).** Vapor pressure data were reported by Hackspill,<sup>1</sup> Kroner,<sup>1</sup> Scott,<sup>1</sup> and Langmuir and Kingdom.<sup>1</sup> See also Boer and Dippel,<sup>1</sup> van Laar,<sup>9</sup> and Egerton.<sup>3</sup> The values for the energy states of gaseous monatomic cesium are from Fowler,<sup>3</sup> Miller and Laporte,<sup>1</sup> and Bacher and Goudsmit.<sup>1</sup>

**CsOH (aq.).** The heat of solution of Cs (c) in water was measured by Beketoff<sup>4, 6</sup> and Rengade.<sup>1</sup> Their data yield, for Cs (c) + H<sub>2</sub>O (liq.) = CsOH (200) +  $\frac{1}{2}$ H<sub>2</sub> (g),  $Q = 51 \pm 1$  and  $48.32 \pm 0.10$ , respectively. Taking Rengade's value, we have computed, for CsOH (200),  $Q_f = 116.7$ . deForcrand<sup>55</sup> measured the heat of dilution of CsOH (aq.) from 2.16 to 222 H<sub>2</sub>O. We have estimated the heat of dilution from 200 to  $\infty$  H<sub>2</sub>O to be zero.

**Cs<sup>+</sup>( $\infty$ ).** From the foregoing data we have obtained for Cs<sup>+</sup>( $\infty$ ) + OH<sup>-</sup>( $\infty$ ),  $Q_f = 116.7$ ; whence, for Cs<sup>+</sup>( $\infty$ ),  $Q_f = 62.04$ .

**CsH (c).** Kasarnowsky<sup>2</sup> quoted unpublished values of Monosohn, giving  $Q_f = 12$ .

**CsOH (c, II).** The heat of solution was measured by deForcrand<sup>44</sup> and by Beketoff.<sup>4</sup> Their values yield, for  $S$ , 16.56<sub>110</sub> and 16.0<sub>330</sub>, respectively.

**CsOH (c, I).** Hevesy<sup>1</sup> measured the heat of transition.

**CsOH · H<sub>2</sub>O (c).** deForcrand<sup>44</sup> measured the heat of solution.

**Cs<sub>2</sub>O (c).** The heat of solution in H<sub>2</sub>O was measured by Beketoff<sup>6</sup> and Rengade.<sup>1, 3</sup> Their values yield  $S = 83.1_{3400}$  and  $72.2_{1800}$ , respectively.

**Cs<sub>2</sub>O<sub>4</sub> (c).** deForcrand<sup>56</sup> measured the heat of solution in H<sub>2</sub>SO<sub>4</sub> (aq.).

**CsF (aq.).** From the ions, we have obtained, for CsF ( $\infty$ ),  $Q_f = 140.24$ . We have estimated the heat of dilution from 800, 200, and 100 H<sub>2</sub>O to  $\infty$  H<sub>2</sub>O.

**CsF (c).** The heat of solution was measured by deForcrand.<sup>57</sup>

**CsF (liq.).** We have estimated the heat of fusion.

**CsF (g).** Vapor pressure data were reported by von Wartenberg and Schulz<sup>1</sup> and Ruff, Schmidt, and Mugdan.<sup>1</sup>

**CsF ·  $n$ H<sub>2</sub>O (c).** deForcrand<sup>59</sup> measured the heats of solution of CsF ·  $\frac{2}{3}$ H<sub>2</sub>O (c) and CsF ·  $1\frac{1}{2}$ H<sub>2</sub>O (c).

**CsHF<sub>2</sub> (aq.).** From the ions, we have computed  $Q_f = 215.4$ .

**CsHF<sub>2</sub> (c).** The heat of solution was measured by deForcrand.<sup>60</sup>

**CsCl (aq.).** From the ions, we have obtained, for CsCl ( $\infty$ ),  $Q_f = 101.727$ . The heat of dilution was measured by Richards and Rowe<sup>3</sup> at 18° from 25 to 400 H<sub>2</sub>O, and by Lange and Messner<sup>1</sup> at 25° in the very dilute region. The latter values have been converted to 18° and combined with the former to give values from 25 to  $\infty$  H<sub>2</sub>O.

**CsCl (c, II).** The data on the heat of solution of CsCl (c) in H<sub>2</sub>O yield the following values for  $S_{200}$ : deForcrand,<sup>46</sup>  $-4.61$ ; deForcrand,<sup>12, 57</sup>  $-4.54$ ; Haigh,<sup>1</sup>  $-4.37$ .

**CsCl (c, I).** Zemczuzny and Rambach<sup>1</sup> measured the heat of transition.

**CsCl (liq.).** We have estimated the heat of fusion.

**CsCl (g).** Vapor pressure data were reported by von Wartenberg and Schulz,<sup>1</sup> Ruff and Mugdan,<sup>1</sup> and Fiock and Rodebush.<sup>1</sup>

**CsBr (aq.).** From the ions, we have obtained, for CsBr ( $\infty$ ),  $Q_f$

=90.71. The heat of dilution has been estimated for the range  $\infty$  to 100 H<sub>2</sub>O.

**CsBr (c).** The heat of solution was measured by deForcrand.<sup>12, 57</sup>

**CsBr (liq.).** We have estimated the heat of fusion.

**CsBr (g).** Vapor pressure data were reported by von Wartenberg and Schulz<sup>1</sup> and Ruff and Mugdan.<sup>1</sup> Sommermeyer<sup>1</sup> calculated, from absorption spectra,  $D^\circ = -89.8$ .

**CsI (aq.).** From the ions, we have obtained, for CsI ( $\infty$ ),  $Q_f = 75.41$ . We have estimated the heat of dilution from  $\infty$  to 100 H<sub>2</sub>O.

**CsI (c).** The heat of solution was measured by deForcrand.<sup>12, 57</sup> His data give  $S_{110} = -8.12$ ; whence, for CsI (c),  $Q_f = 83.90$ . Beketoff<sup>8</sup> measured the heats of solution of NaCl (c) + CsI (c), NaI (c) + CsCl (c), KCl (c) + CsI (c), and KI (c) + CsCl (c). His data yield two identical values for the heat of formation of CsI (c), namely 83.88.

**CsI (liq.).** We have estimated the heat of fusion.

**CsI (g).** Vapor pressure data were reported by von Wartenberg and Schulz<sup>1</sup> and Ruff and Mugdan.<sup>1</sup> We have taken  $V = -36.0^{1000}$  or  $V_s = -46.7$  at 18°; whence  $Q_f = 37.2$ . Mayer's<sup>3</sup> data for the reaction,  $\text{Cs}^+(\text{g}) + \text{I}^-(\text{g}) = \text{CsI}(\text{g})$ , give, for CsI (g),  $Q_f = 38.2$ . From the limit of the absorption spectrum, Franck, Kuhn, and Rollefson<sup>1</sup> calculated  $D^\circ = -75.0$ ; whence  $Q_f = 30.5$ . Sommermeyer,<sup>1</sup> from similar data, gave  $D^\circ = -77.8$ ; whence  $Q_f = 33.3$ . See also Visser.<sup>2</sup>

**CsI<sub>3</sub> (c), CsI<sub>4</sub> (c).** Foote, Bradley, and Fleischer<sup>1</sup> obtained dissociation pressure data on these substances.

**Cs<sub>2</sub>S (aq.).** From the ions, we have obtained, for Cs<sub>2</sub>S ( $\infty$ ),  $Q_f = 114.08$ .

**Cs<sub>2</sub>S (c).** Rengade and Costeaunu<sup>1</sup> measured the heat of solution.

**Cs<sub>2</sub>SO<sub>4</sub> (aq.).** deForcrand<sup>46</sup> measured the heat of neutralization of LiOH (aq.) with H<sub>2</sub>SO<sub>4</sub> (aq.). His data, together with the heat of dilution, yield, for Cs<sub>2</sub>SO<sub>4</sub> ( $\infty$ ),  $Q_f = 339.56$ . From the ions, we have obtained 339.88. The heat of dilution of Cs<sub>2</sub>SO<sub>4</sub> (aq.) was measured at 25° in the very dilute range by Lange and Streeck.<sup>1</sup> Their values have been converted to 18° and extrapolated to 200 H<sub>2</sub>O.

**Cs<sub>2</sub>SO<sub>4</sub> (c).** deForcrand<sup>46</sup> measured the heat of solution.

**CsHSO<sub>4</sub> (aq.).** deForcrand<sup>46</sup> measured the heat of reaction between CsOH(110) + H<sub>2</sub>SO<sub>4</sub>(220), and between CsHSO<sub>4</sub>(330) + CsOH(110). His data yield for CsHSO<sub>4</sub>(330),  $Q_f = 275.47$  and 275.79, respectively.

**CsHSO<sub>4</sub> (c).** deForcrand<sup>46</sup> measured the heat of solution.

**CsI · 4SO<sub>2</sub> (c).** Ephraim and Kornblum<sup>1</sup> and deForcrand and Taboury<sup>1</sup> found  $D = -10.9$  and  $-9.9$ , respectively.

**CsNO<sub>3</sub> (aq.).** From the ions, we have computed, for CsNO<sub>3</sub> ( $\infty$ ),  $Q_f = 111.23$ . Values for the heat of dilution were given for the range 25 to 400 H<sub>2</sub>O by Richards and Rowe,<sup>2, 3</sup> and we have extrapolated their values to  $\infty$  H<sub>2</sub>O.

**CsNO<sub>3</sub> (c, II).** Haigh<sup>1</sup> measured the heat of solution.

**CsNO<sub>3</sub> (c, I).** Bridgman<sup>6a</sup> measured the heat of transition.

$\text{Cs}_2\text{CO}_3$  (aq.). deForcrand<sup>49</sup> measured the heat of neutralization of  $\text{CsOH}$  (aq.) with  $\text{CO}_2$  (aq.). His data yield, for  $\text{Cs}_2\text{CO}_3(2000)$ ,  $Qf = 284.81$ ; whence (with an estimated heat of dilution to  $\infty \text{H}_2\text{O}$ ), for  $\text{Cs}_2\text{CO}_3(\infty)$ ,  $Qf = 284.85$ . From the ions, we have obtained 284.58. deForcrand<sup>52</sup> measured the heat of dilution from 7.59 to 228  $\text{H}_2\text{O}$ . We have estimated the values to 2000 and  $\infty \text{H}_2\text{O}$ .

$\text{Cs}_2\text{CO}_3$  (c). deForcrand<sup>49</sup> measured the heat of solution, and Lebeau<sup>1</sup> the dissociation pressure at various temperatures.

$\text{Cs}_2\text{CO}_3 \cdot 3\frac{1}{2} \text{H}_2\text{O}$  (c). deForcrand<sup>52</sup> measured the heat of solution.

$\text{CsHCO}_3$  (aq.). deForcrand<sup>53</sup> measured the heat of the reaction of  $\text{CsOH}(110)$  with  $\text{CO}_2(1800)$ . His data yield, for  $\text{CsHCO}_3(1900)$ ,  $Qf = 227.16$ .

$\text{CsHCO}_3$  (c). deForcrand<sup>53</sup> measured the heat of solution. His data give  $Qf = 231.0$ . Caven and Sand<sup>2</sup> found, from dissociation pressures,  $D = -29.0$ ; whence  $Qf = 241$ .

$5\text{Cs}_2\text{CO}_3 \cdot 2\text{CsHCO}_3 \cdot n\text{H}_2\text{O}$  (c). deForcrand<sup>54</sup> measured the heats of solution of  $5\text{Cs}_2\text{CO}_3 \cdot 2\text{CsHCO}_3 \cdot 10\text{H}_2\text{O}$  (c) and  $5\text{Cs}_2\text{CO}_3 \cdot 2\text{CsHCO}_3 \cdot 17\frac{1}{2}\text{H}_2\text{O}$  (c).

$\text{CsCNS} \cdot \frac{1}{2}\text{SO}_2$  (c). Ephraim and Kornblum<sup>1</sup> found  $D = -10.1$ .

$2\text{CsCl} \cdot \text{CuCl}_2 \cdot n\text{H}_2\text{O}$  (c). Bouzat and Chauvenet<sup>2</sup> measured the heats of solution of the anhydrous salt and the dihydrate.

$n\text{CsCl} \cdot \text{ThCl}_4 \cdot m\text{H}_2\text{O}$  (c). Chauvenet<sup>2</sup> measured the heats of solution of  $2\text{CsCl} \cdot \text{ThCl}_4$  (c),  $2\text{CsCl} \cdot \text{ThCl}_4 \cdot 8\text{H}_2\text{O}$  (c), and  $4\text{CsCl} \cdot \text{ThCl}_4$  (c).

$\text{CsAl}(\text{SO}_4)_2 \cdot n\text{H}_2\text{O}$  (c). We have assumed that the heat of solution of  $\text{CsAl}(\text{SO}_4)_2 \cdot 12\text{H}_2\text{O}$  (c) is  $-11.5$ , by analogy. The heats of dissociation of the various hydrates have been calculated from the vapor pressure measurements of Krause, Fricke, and Querengasser<sup>1</sup> and Ephraim and Wagner.<sup>1</sup>

$\text{CsLiClII}$  (c, melt). Beketoff<sup>8</sup> measured the heats of solution of  $\text{CsLiClII}$  (c, melt) and of  $\text{CsI}$  (c) +  $\text{LiCl}$  (c).

$\text{CsNaClII}$  (c, melt). Beketoff<sup>8</sup> measured the heats of solution of the melt and of  $\text{NaCl}$  (c) +  $\text{CsI}$  (c).

$\text{CsKClII}$  (c, melt). Beketoff<sup>8</sup> measured the heats of solution of the melt and of  $\text{KCl}$  (c) +  $\text{CsI}$  (c).

## ELEMENT 87

**M** (c). Standard state.

# INDEX

## COMPOUNDS

As indicated on page 15, the formula of the substance, written according to the standard arrangement given on page 16, determines (1) the element under which the compound will be listed and (2) the position the compound will occupy in that section. In the table, all locations are exact; in the text, all main locations are exact and the sublocations are approximately in the proper order. The index for the elements is given below.

## ELEMENTS

	TABLE	TEXT		TABLE	TEXT
Actinium .....	111	337	Germanium .....	55	254
Aluminum .....	106	331	Gold .....	80	296
Antimony .....	41	224	Hafnium .....	103	328
Argon .....	17	171	Helium .....	17	171
Arsenic .....	39	223	Holmium .....	109	334
Barium .....	126	355	Hydrogen .....	20	174
Beryllium .....	112	337	Illinium .....	110	335
Bismuth .....	42	228	Indium .....	61	263
Boron .....	105	329	Iodine .....	25	189
Bromine .....	24	185	Iridium .....	82	299
Cadmium .....	67	272	Iron .....	89	308
Calcium .....	117	343	Krypton .....	18	171
Carbon .....	43	229	Lanthanum .....	111	337
Cerium .....	111	336	Lead .....	58	257
Cesium .....	168	402	Lithium .....	131	362
Chlorine .....	22	179	Lutecium .....	109	334
Chromium .....	95	318	Magnesium .....	113	339
Cobalt .....	87	305	Manganese .....	92	314
Columbium .....	101	326	Masurium .....	84	302
Copper .....	73	283	Mercury .....	69	276
Dysprosium .....	109	334	Molybdenum .....	97	321
Erbium .....	109	334	Neodymium .....	110	335
Europium .....	109	335	Neon .....	17	171
Fluorine .....	21	178	Nickel .....	84	302
Gadolinium .....	109	334	Nitrogen .....	32	206
Gallium .....	60	263	Osmium .....	82	300

	TABLE	TEXT		TABLE	TEXT
Oxygen .....	19	172	Sodium .....	137	367
Palladium .....	83	300	Strontium .....	122	351
Phosphorus .....	37	218	Sulfur .....	27	193
Platinum .....	81	298	Tantalum .....	101	326
Polonium .....	31	206	Tellurium .....	31	205
Potassium .....	150	384	Terbium .....	109	334
Praseodymium .....	110	335	Thallium .....	62	264
Protoactinium .....	101	326	Thorium .....	104	328
Radium .....	130	362	Thulium .....	109	334
Radon .....	18	172	Tin .....	56	255
Rhenium .....	82	300	Titanium .....	101	326
Rhodium .....	83	301	Tungsten .....	98	322
Rubidium .....	165	400	Uranium .....	99	323
Ruthenium .....	84	302	Vanadium .....	100	325
Samarium .....	109	335	Xenon .....	18	172
Scandium .....	108	333	Ytterbium .....	109	334
Selenium .....	30	202	Yttrium .....	108	334
Silicon .....	54	252	Zinc .....	64	266
Silver .....	77	290	Zirconium .....	102	327
